**Fastnet Lighthouse**, on a rock 4 miles SW. of Cape Clear (q.v.), with a revolving light 148 feet above high-water, and visible for 18 miles.

**Fastolf**, SIR JOHN, was born about 1378 at Caistor, near Yarmouth, and 'exercised,' says Caxton, 'the wars in the royaume of France and other countries for forty years enduring.' He distinguished himself at Agincourt (1415), and still more in the 'Battle of the Herrings' (1429), so called because, while conveying supplies to the English besiegers of Orleans, he furnished a sort of *laager* of herring-barrels, and with his archers beat off a whole French army. Later in the same year he was less successful against Joan of Arc, and at Patay, according to Monstrelet, whom Shakespeare follows, displayed such cowardice that the Duke of Bedford stripped him of his Garter. This, however, is very questionable; he rather seems to have retained all his honours till in 1440 he came home to Norfolk, and in 1441 he was granted a pension of £20 'for notable and praiseworthy service and good counsel.' His Norfolk life is mirrored faithfully in the *Paston Letters*, where we see him adding to his broad possessions, heaping up riches, building a huge new castle at Caistor—a hard old man, yet not without love of

learning and the church. He died 5th November 1459. His identification with 'Sir John Falstaff' is at least incomplete, for Oldcastle (q.v.) was certainly Shakespeare's prototype.

**Fat.** See *FATS*, *OBESITY*.

**Fata Morgana**, the Italian name for a striking kind of mirage observed in the Strait of Messina. A spectator on the shore sees images of men, horses, ships, &c., sometimes in the water, sometimes in the air, the same object having frequently two images, one inverted. It is so named because supposed to be caused by the fairy (*fata*) Morgana of Arthurian romance. See *MIRAGE*.

**Fate.** The Fates, Fatalism, express a conception which has more or less prevailed in all religions. The words are derived from the Latin *Fatum*, which has primarily a passive signification, denoting something uttered—a decree or ordinance. The Greeks expressed the same thought by *Éimarmenê*. *Moiræ* (from *meros*, 'part' or 'lot,' 'share'), again, was the active personification of the idea—the goddess Fate or Destiny. It constituted in the Greek mythology something like an ultimate monotheistic element—the vague Unity binding together and dominating over the crowd of Olympian deities. With Homer, who in every instance save one speaks of Fate (*Moiræ*) in the singular, Fate was not a deity, but a mere personification, the destinies of men being made by him to depend upon the will of the gods; whilst, according to the later Greeks and the Romans, the gods themselves were subject to the control of the *Moirai* or *Pareræ*. Hesiod, however, who is almost contemporary with Homer, speaks of three Fates, whom he calls daughters of Night—Clotho, the spinner of the thread of life; Lachesis, who determines the lot of life; and Atropos, the inevitable. They were usually represented as young women of serious aspect; Clotho with a spindle, Lachesis pointing with a staff to the horoscope of man on a globe, and Atropos with a pair of scales, or sun-dial, or an instrument to cut the thread of life. In the oldest representations of them, however, they appear as maistrons, with staves or sceptres. They had places consecrated to them throughout all Greece, at Corinth, Sparta, Thebes, Olympia, and elsewhere.

With the course of Greek thought the conception of Fate became more spiritualised. In Æschylus it is an inexorable Destiny; in Sophocles and Plato it is more of a free and ordering Will. In the later forms of Greco-Roman speculation, again, it undergoes various modifications. With the Epicureans it seems identical with Chance (*Tuchê*); with the Stoics it is the very opposite of this. In the one case the Absolute is a mere blind fatality; in the other case it is an imminent necessity of reason, governing with iron sway the apparently accidental phenomena of life.

In the two great religions of modern times, Christianity and Mohammedanism, the same conception is found in various forms. In the latter the Highest seems to be conceived as inexorable law, swallowing up every lower law of activity; yet the abject self-subjection to fate generally understood to be implied in the Moslem *Kismet* is by no means indicated in the Koran (see *MUHAMMAD*). In Christianity and the modern speculation which it has coloured it shows itself less broadly in the well-known doctrines of Predestination and of philosophical Necessity. In the Predestination theory of Augustine, Calvin, and many others, the old fatalistic doctrine is repudiated; the recognition of a free determining element in the divine Will separates their idea of it altogether from that of a more blind Destiny; but the influence of the mode of thought out of which

the old idea sprung appears in the manner in which the divine decrees are sometimes spoken of as inexorably overbearing human freedom. In the doctrine of philosophical necessity promulgated by Leibnitz and Edwards, and in a somewhat different form by modern scientific modes of thought, the same idea emerges as inevitable sequence—of an invariable connection linking together all phenomena, material and mental. An immutable law is declared to pervade and harmonise all existence. This is a much higher conception, but is obviously not wholly unrelated to the old pagan doctrine of Fate. See PREDESTINATION, NECESSITY.

**Fatehganj** ('Victory Market'), the name of two villages and battlefields in Bareilly district, in the North-west Provinces. (1) **EAST FATEHGANJ**, 23 miles SE. of Bareilly, was founded by the Nawab of Oudh to commemorate the British victory over the Rohillas (1774), which gave him possession of a large part of Rohilkhand.—(2) **WEST FATEHGANJ**, about 35 miles NW. of the former, was the scene of another victory over the Rohillas in 1794. There is a monument over the grave of the Company's troops, and a carved and minareted tomb holds the remains of two Rohilla chieftains.

**Fatehgarh**, the cantonment and administrative headquarters of Farukhabad district, lies 3 miles E. of the native city of Farukhabad, with which it forms a joint municipality. Government has here an important gun-carriage factory; and there are flourishing settlements of native Christians, established by the American Presbyterian Mission, which was formed in 1838. A British military station since 1802, the place was attacked by Holkar in 1804, and is infamous in the annals of the mutiny of 1857, in the course of which upwards of 200 Europeans—men, women, and children—mostly fugitives brought back after escaping down the Ganges, were sabred or shot by the rebels, either here or at Cawnpore. Pop. 12,435.

**Fatehpur**, (1) capital of a district in the North-west Provinces, on the East Indian Railway, 70 miles NW. of Allahabad. It contains two interesting mosques, and has a trade in hides, soap, and grain. Pop. 21,328. The district of Fatehpur lies wholly within the Doab (q.v.), and occupies its entire breadth from Jumna to Ganges. Area, 1639 sq. m., more than half of which is highly cultivated; pop. (1881) 683,745, nearly nine-tenths Hindus.—(2) A fortified town of Rajputana, 145 miles NW. of Jaipur. Pop. 14,731.

**Fatehpur Sikri**, a former capital of the Mogul empire, was founded by Akbar in 1570, but soon after abandoned for Agra, 23 miles to the east. The remains of the magnificent architectural works with which he and his son enriched it are inclosed by a high stone wall, about 5 miles in circuit, and include several palaces, a noble mosque, and numerous other splendid ruins. Within the bounds of Akbar's wall are the modern town of Fatehpur and the village of Sikri, with insignificant manufactures of carpets and millstones. Pop. 6243.

**Father**. See PARENT AND CHILD, FAMILY, PATRIA POTESTAS.

**Father-lasher**, a name applied to two Bull-heads (*Cottus scorpius* and *bubalis*) which occur commonly on British coasts. They have a wide European and American distribution, and belong to the Gurnard (q.v.) family (Cottidae), in the spiny-rayed (Acanthopteri) order of bony fishes. They are both somewhat forbidding little fishes, four or five inches in length, with dark, quaintly mottled skins, and with spines on the head. The head and pectoral fins are large in proportion to the body. The male builds a nest and guards the young.

192

In Scotland the second species is sometimes called the Lucky Proach, while the first species is also known as the Sea Scorpion. Both forms, but

Father-lasher (*Cottus bubalis*).

especially the first, are often left on the shore or among the rocks by the retreating tide.

**Fathers of the Church** (*Patres Ecclesiastici*), a term which, strictly used, denotes only certain early writers of unimpeachable orthodoxy and eminent sanctity, who have been accepted by the church as duly qualified exponents of her doctrines. The title of 'father' was given in early times to all bishops, confessors, and heads of monasteries (see ABBOT); but the expression 'fathers of the church' has become restricted to this more definite sense, while those writers whose heterodoxy is manifest are called simply *Scriptores Ecclesiastici* ('Church-writers'). The title of 'fathers,' however, is often bestowed on some, such as Origen and Tertullian, the errors in whose writings are overlooked for the sake of the value of their orthodox contents. Historians are generally agreed in excluding from the patristic period the Apostolic Fathers (q.v.), and in dating its commencement from the 2d century; but there is no unanimity regarding the time at which it may be said to have closed. In the Greek Church the period is often brought down to the Council of Florence (1441). Roman Catholic writers include within its limits all writers who were witnesses to the Catholic doctrine of the church during the first twelve centuries of the Christian era, or even down to the Council of Trent; moreover, in 1871-78 Saints Alfonso de Liguori and Francis de Sales, the former of whom died so late as 1787, were raised to the dignity of *Doctores Ecclesiae*. But there appears no good reason why Anselm and Bernard and those that immediately follow them should be removed from the list of the schoolmen, and the patristic period may conveniently be taken to have closed for the Eastern Church with John of Damascus (756), and for the Western with Gregory the Great (604). Even Roman Catholic theologians acknowledge the higher value and importance of the fathers of the first six centuries. Arranged in the order of their deaths, chief among the ante-Nicene fathers are Justin Martyr, Irenaeus, Clement of Alexandria, Tertullian, Origen, Cyprian, and Gregory Thaumaturgus; while the post-Nicene fathers include Eusebius of Caesarea, Hilary of Poitiers, Athanasius, Basil, Cyril of Jerusalem, Gregory Nazianzen, Gregory of Nyssa, Ambrose, Epiphanius, Chrysostom, Jerome, Augustine, Cyril of Alexandria, Leo the Great, Gregory the Great, and John of Damascus. For all these, see separate articles, as well as for many of the other early writers whom the Latin Church includes in the list. In both divisions of the church four authors are recognised as fathers *per eminentiam*: in the East, Athanasius, Basil, Chrysostom, Gregory Nazianzen; in the West, Ambrose, Jerome, Augustine, Gregory. The study

of the life and writings of the fathers is sometimes regarded as constituting a distinct discipline, known as patristics or patrology; but this practically constitutes a study of the church's history during the first six centuries. See CHURCH HISTORY. With respect to the authority of the fathers, the Roman Catholic position is that the teaching of individual fathers is to be accepted or rejected on its merits, and their evidence as witnesses to the tradition of the church, either singly or when several concur, is to receive so much credence as may appear due after the quality and circumstances of the testimony have been considered; but their morally unanimous consent is held to carry decisive authority in matters of faith. Protestant writers, on the other hand, while acknowledging the merits of the patristic writings, and recognising in many important points a *consensus patrum*, dwell upon the admitted fallibility of the authors, and insist upon the sufficiency of Holy Scripture, as containing 'all things necessary to salvation.' See EXEGESIS; also INFALLIBILITY.

Editions of individual fathers are noted under their separate articles. Collective editions are De la Bigne's *Maxima bibliotheca veterum Patrum* (Paris, 1575; improved ed. 27 vols. Leyden, 1677—the Greek writings translated into Latin); Gallandi's *Bibliotheca veterum Patrum* (14 vols. Venice, 1765–81); and Migne's exhaustive *Patrologia cursus completus* (387 vols. Paris, 1844–66). This last is continued in Horoy's *Medii ævi bibliotheca patristica, sive Patrologia ab anno 1236 usque ad concil. Tridentinum* (1st series, *Doctores eccl. lat.*, Paris, 1879 et seq.). Also the Vienna Academy has been issuing since 1866 a *Corpus scriptorum ecclesiasticorum latinorum*, based on a critical comparison of MSS.; a fifth of the series, which will be completed in about 100 volumes, had appeared down to 1889. English translations are numerous. Clark's *Ante-Nicene Library* (Edin. 1864–71) is complete in 24 vols., and the *Library of the Fathers* (Lond. 1838–85), edited by Pusey, Keble, Newman, and others, extends to 48 vols. There is a *Select Library of the Nicene and post-Nicene Fathers* (New York; 9 vols. down to 1889), edited by Dr Philip Schaff; and the useful series of *Fathers for English Readers* (S.P.C.K., 11 vols. 1878–84) likewise deserves mention. See also FARRAR'S *Lives of the Fathers* (2 vols. Edin. 1889).

**Fathom**, a measure of six feet, principally used in reference to marine soundings, and in mines. Originally a fathom (A.S. *fædm*) was taken as the width to which the two outstretched arms extended.

**Fatimides**, or FATIMITES, an Arab dynasty, descended from Ali and Fatima, daughter of Mohammed, ruled over Egypt and North Africa (909–1171), and later over Syria and Palestine. In religion the Fatimides were Shiites of the Ismailian sect. The Fatimide calif Hakem was the founder of the Druses (q.v.). Compare also CALIF, EGYPT.

**Fats** are natural oils, solid at the ordinary temperature, which occur in plants and animals. They are all compounds of glycerin with various fatty acids. The animal fats are to be regarded as ethers formed by replacing the removal atoms of hydrogen in the triatomic alcohol glycerin,  $C_3H_5\{O\}_3$ , by the acid radicles of the acetic and oleic series. The most important of these fats are Palmitin, Stearin, and Olein.

In addition to these we have in milk, butter, &c. small quantities of the neutral fats of Butyric, Caproic, Caprylic, Capric, and Myristic acids.

They are oily bodies; some solid, others fluid; at the ordinary temperature. They are insoluble in water and in cold alcohol, soluble in hot alcohol, in ether, chloroform, &c. Under the action of caustic alkalies or superheated steam they are decomposed into their fatty acid and glycerin. The fat of different animals differs in its characters according to the relative proportion of these various fats which it contains. Thus, the fat of the dog, which contains a large proportion of olein, melts at a comparatively low temperature, while the fat of the sheep, on the other hand, which is particularly rich in stearin, has a much higher melting-point.

Whatever be the nature of the fat, it occurs in the animal body inside the living units or cells in the form of small globules. Fats appear to be an almost invariable constituent of all living protoplasm; but in certain tissues they accumulate in very large amounts. This is especially the case in the cells of loose fibrous tissue, where the deposition of fat is frequently so great as to form regular masses or lobules. Under the skin, in the abdomen, in the orbits, round the heart, and in various other places these masses are well marked.

The quantity of fat in the human body varies considerably at different periods of life. In the earlier stages of fetal existence we find scarcely any fat; in new-born children there is usually a considerable quantity of this substance deposited under the skin, and the organism continues rich in fat till the age of puberty, when a marked diminution of the substance occurs. It again increases about middle life, and then occasionally occurs in great excess; for example, three or four inches of fat are not unfrequently found under the skin of the abdomen in corpulent persons.

The fats of the body are derived not only from the fats of the food, but also from both carbohydrates and proteids. It has now been clearly shown that an animal takes up and stores in its body any fat which may be administered in the food, and that it may thus for the time being have the chemical nature of its fat entirely altered. After a time, however, the living protoplasm of the body seems to be able to convert the foreign fat so stored into the proper fat of the animal.

By feeding dogs on a flesh diet, and carefully analysing the excreta, Pettenkofer and Voit have shown that the flesh of the food is a source of fat in the body. That carbohydrates—such as sugar and starch—are also sources of fat is a matter of popular belief. Various researches have clearly demonstrated that this belief is correct. By feeding young growing pigs on a diet of known composition, and afterwards killing them and analysing their bodies, it was shown that the fat found was in such amounts that it could have been derived only from the carbohydrates of the food.

The physiological value of the fats is due partly to their physical and partly to their chemical characters. The uses of the fat deposited beneath the skin are, first, to protect the body from external shocks by a uniform diffusion of pressure through the whole adipose tissue; and, secondly, to keep up the heat of the body, by materially checking, through its very slight conducting power, the loss of free heat by radiation. This use of the fat is most clearly seen in some of the lower animals (the seal, whale, &c.), which are exposed to very low temperatures. Another physical use of fat is to promote the mobility of various organs. Hence, in cases of extreme emaciation, it always remains in the parts where motion is most essential, as the heart and the orbit of the eye.

The chief chemical use of fat is as a store of potential energy for the body (see FASTER).

On account of the large amount of carbon and the small amount of oxygen contained in the molecule, it is peculiarly valuable in this respect. Measuring the potential energy in grammes degrees, we find that 1 gramme of fat yields 9069 grammes degrees of heat; 1 gramme of pteridids yields 4368; 1 gramme of carbohydrates yields 3912. Unfortunately the process of digestion and assimilation of fat is difficult, and for this reason, as well as on account of its relatively high price, only a moderate amount can be daily consumed (see OBESITY).

**Fatty Acids.** See OILS.

**Fatuity.** See IMBECILITY, INSANITY.

**Fatwa**, a town of Bengal, at the confluence of the Purnpun and the Ganges, and on the East Indian Railway, 8 miles from Patna. It is thus a place of some commercial importance; and as the Ganges is here deemed peculiarly sacred, Fatwa is at certain seasons of the year the resort of large numbers of pilgrims. Pop. 10,919.

**Faucher**, LÉON, a French publicist and statesman, was born at Limoges, 8th September 1803. He studied at first philology and archaeology, but about the period of the July revolution (1830) betook himself to journalism and political economy. From 1830 to 1842 he was successively editor of the *Temps*, the *Constitutionnel*, and the *Courrier Français*. In 1843 he began to write for the *Revue des Deux Mondes* a series of articles on the industrial condition of England, collected in two volumes in 1845 under the title of *Études sur l'Angleterre*. After the revolution of 1848 he sat in the Constituent and Legislative Assemblies for the department of Maine. When Louis Napoleon was chosen president, Faucher became first minister of Public Works, and subsequently minister of the Interior; but, when the president proposed to appeal to universal suffrage, Faucher gave in his resignation, and withdrew from political life. He died at Marseilles, 14th December 1854. Several of his most valuable contributions to politics are printed in *Économistes et Publicistes Contemporains*, and in the *Bibliothèque des Sciences Morales et Politiques*.

**Faucit**, HELEN. See MARTIN, LADY.

**Fault**, the term in Mining and Geology for any interruption in the continuity of the strata, coupled with the displacement of the beds on either side of the line of fracture. See DISLOCATION.

**Fauna**, a term employed to designate animals collectively, or those of a particular country, or of a particular geological period. Thus, we speak of the fauna of Great Britain, the recent fauna, the fossil fauna, the fauna of the Eocene period or formation, &c. The term bears the same relation to the animal kingdom that *Flora* does to the vegetable. Its derivation is from the mythological fauns, regarded as the patrons of wild animals. In the fauna of any country are included only those animals which are indigenous to it, and not those which have been introduced.

**Fauns**. Faunus, grandson of Saturn, was an ancient Italian king, who instructed his subjects in agriculture and the management of flocks, and was afterwards worshipped as the god of fields and of shepherds. The festival of the *Faunalia*, held on the 5th December, referred to the protection he exercised over agriculture and cattle. *Fauna* was his female complement. He was also worshipped as a prophetic divinity. As deity of the woods and of flocks and herds, he corresponds to the Greek Pan, and hence with his name became associated the attributes of the latter. The idea also arose of a plurality of Fauns, like the Greek Satyrs, who were represented with short horns, pointed ears, tails, and goats' feet, and to whom all terrifying

sounds and appearances were ascribed. Readers of Hawthorne's *Marble Faun* (or *Transformation*) will remember the artistic use there made of the conception.

**Fauntleroy**, HENRY, forger, was born in 1785, and at fifteen entered the London banking-house of Marsh, Sibbald & Co. His father had been one of the original founders, and on his death in 1807 the son became a partner, and ere long almost its sole manager. In 1824 it was discovered that the signatures of two trustees for a sum of £1000 had been forged four years before for the purpose of selling the stock, while Fauntleroy had been paying the dividends regularly ever since. Other and much larger transactions of the same nature were discovered, and Fauntleroy was put on trial (30th October) with seven separate indictments against him, the one on which the attorney-general most relied being a forged deed in his sister-in-law's name for a transfer of £5480. A paper in Fauntleroy's handwriting was produced in which he confessed to having forged powers of attorney in order to save the credit of the house. The prisoner was condemned to death. The case excited great interest, and many influential persons exerted themselves to procure a commutation of the penalty, but without success. Fauntleroy was hanged, 30th November 1824, in the presence of a vast multitude of spectators. See Griffith's *Chronicles of Newgate* (1884).

**Fauriel**, CLAUDE CHARLES, an eminent French *littérateur*, was born at St Etienne, 21st October 1772, and educated at the Collège des Oratoriens at Tournon. In 1799 he was appointed secretary under Fouché, but soon resigned his office to devote himself entirely to letters. He made himself familiar with Sanskrit, Arabic, and the treasures of classical antiquity and of the middle ages, and put in circulation, says M. Reuan, a greater number of ideas than did any contemporary writer. After the July revolution he was appointed a professor in the Paris Faculté des Lettres, and was elected to the Academy in 1836. He died at Paris, 15th July 1844. His earliest works were translations of Baggensen's *Parthenais* (1810), Manzoni's tragedies (1823), and modern Greek folk-songs (1824). In 1836 he published his chief work, *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains* (4 vols.); the year after, an edition of the Provençal historical chronicle on the crusade against the Albigenses, with a remarkable historical introduction. Fauriel also contributed several important essays to the literary journals of France, the best known, *Sur l'Origine de l'Épopée du Moyen Âge* (1833). Two years after his death appeared his professorial lectures, *Histoire de la Poésie Provençale* (3 vols. 1846), in which he endeavoured with great erudition and originality of criticism to show that to the Provençals are to be attributed the composition and primitive development of the greater portion of the romances of chivalry, including those which describe the contests of the Christians and Moors in Spain, and those which form the Charlemagne cycle, and that thus the old Spanish and German poetry found its origin on the soil of France. See Sainte-Beuve in vol. iv. of *Portraits Contemporains*.

**Faust**, DR, a famous dealer in the black art, whose legendary story, a product of the Reformation period, has filled a great place in literature. The historical person who bore the name of Faust lived in the first half of the 16th century, and can be traced in the testimonies of contemporaries from 1507 down to about 1540. He was born at Knittlingen in Württemberg, or, according to others, at Roda, near Weimar. His parents were poor, but

the bequest of a rich uncle enabled him to study medicine and magic at Cracow. From a letter of the Abbot Trithemius of Spanheim, written August 20, 1507, we find an account of him first at Gelnhausen the year before, then at Wurtzburg, next at Kreuznach, under the name of Georgius Sabellicus *Faustus junior*. He is described as a vagabond, boastful and pretentious, giving himself out as skilled in necromancy, astrology, magic, chiromancy, agromancy, pyromancy, and hydromancy, able to restore by his own genius the works of Aristotle and Plato if they were lost, and reproduce as often as required all the miracles of Christ. At Kreuznach he was employed to teach by Franz von Sickingen, but was soon obliged to flee for his abominable debaucheries. In 1509 one Johann Faust was pursuing his studies at Heidelberg, where he took the degree of bachelor of theology, and may be the same as the vagabond scholar whom Trithemius denounced. Mitianus Rufus, in a letter to Henri Urbain in 1513, speaks with contempt of one Georgius Faustus at Erfurt, whose follies—as those of a stranger—are of no consequence. Here he seems to have made long and frequent sojourns, if the chronicle first published by Molschmann may be accepted as contemporary evidence; and, moreover, the main elements in his story appear to be already formed. In 1516 we find him at Maulbronn, next in 1525 (traditionally) at Leipzig; in 1528, as Dr George Faust of Heidelberg, he was expelled from Ingolstadt. The physician Philip Begardi, in his *Index Sanitatis* (1539), speaks of him as having been for some years known as a rogue and a vagabond who gave himself out as *philosophus philosophorum*, and was highly renowned among his dupes for his great skill, not alone in medicine, but also in chiromancy, necromancy, physiognomy, crystallomancy, and the like other arts. Begardi had not himself seen him, but had many accounts of him. A somewhat ambiguous sentence at the end of the passage about Faust has been interpreted as conveying the fact that he was just dead, and certainly after 1539 we have no positive proofs of his existence, while we know that he was dead by 1544. The Protestant theologian Johann Gast, in the second volume of his *Convivialium Sermonum Liber* (1544), speaks of having supped with Faust at Basel, where he was attended by a dog and a horse that were evidently demons, and further describes his deplorable end, how the devil strangled him, and how his dead body lay constantly on its face on the bier, although as often as five times turned upwards.

Conrad Gesner of Zurich, in a letter written in 1561, mentions him as a wandering scholar of marvellous powers, long since dead. Next Manlius, a pupil of Melanchthon, tells us in his *Locorum Communium Collectanea* (1562) that his master knew Faust, who was a native of Kundling in his own country, and described him as 'turpissima bestia, et cloaca multorum diabolorum.' He described further how he had studied magic at Cracow, worked many vain wonders throughout Germany, and was at last carried off by the devil some years before. Joannes Wiorus, a pupil of Cornelius Agrippa, in his *De Prestigiis Demonum* (1583), speaks of Faust as having been born at Kundling and educated at Cracow, and as having travelled over all Germany, and been imprisoned for his misdeeds in a town in Holland. He tells two stories of him which harmonise with the tradition. According to Widman, Luther in his conversations spoke freely of Faust and his familiar in illustration of the craft and wickedness of the devil, and of the necessity of avoiding all perilous dealings with him. Faust he condemned as the typical infidel and impious man, as well as the mere profligate and the vagabond. Here we see the beginnings

of the religious colour which was later to become one of the main characteristics of the story. Count Froben Christoph von Zimmern in his *Chronik* twice alludes to Faust, confirming the account that he died in an inn during the night at the hands of his familiar when his hour had come. One of the last notices of Faust before the publication of the *Volksbuch*, which was to fix the form of the legend for all time, is that of Augustin Lercheimer of Steinfelden, a Protestant theologian, and, like Manlius, a pupil of Melanchthon. In his *Christliche Bedenken und Erinnerung von Zauberei* (1585) we find frequent notices of Faust, and in the minuteness of his details we see the legend full-grown. Again, in two among the seventeen tracts composing the *Theatrum de Veneficiis* (1586) there is distinct mention of Faust. Martin Delrio, in his *Disquisitionum magicarum Libri sex* (1624), and Philip Camerarius, in his *Opere Horarum Subcivium* (1638), testify further to his story.

The first literary version of the Faust story was the *Volksbuch*, published by Johann Spies at Frankfurt in 1587, under the title *Historia von Dr Johann Fausten, dem Weitbeschreiten Zauberer und Schwartzkünstler, &c.*, of which but five copies are in existence—one in the British Museum. At the close of the dedication Spies explains that he has printed the book for a warning to all Christians, and tells how he had received his version of the legend from a friend at Spire, evidently a Protestant theologian from the Scripture texts with which it is scattered. The 'preface to the Christian reader' is an admirable sermon upon the damnable consequences of magic and commerce with the devil. The book is divided into sixty-eight chapters, unequally arranged in three parts and a conclusion. The first part recounts, in seventeen chapters, the birth of Faust at Rod, near Weimar, his early studies and bold speculations, his meeting with the devil in a wood near Wittenberg, and his three several disputations in his own dwelling with the fiend, who gives his name as Mephistophiles, when the compact is concluded by which Faust signs away his soul in blood drawn from a vein in his left hand, in return for the services of Mephistophiles for twenty-four years. The fiend now supplies him with the means wherewith Faust and his *famulus* Wagner are able to live in the greatest luxury. Ere long Faust wishes to marry, but is not allowed, as marriage is an institution of God, and therefore hateful to the devil. Then follow the answers of Mephistophiles to Faust's questions about hell and its ten governments, the form and figure of the fallen angels, the power of the devil, the division of hell called Golemma, its creation, and the tortures peculiar to it.

The second part contains fifteen chapters relating to the rest of Faust's questions about astronomy and astrology, the causes of winter and summer, the creation of the firmament; after which follow the false answers of the fiend about the creation of the world and the birth of man, and the account of Faust's earliest adventures, including a visit to hell and an account of its hierarchy, a journey to the stars, riding upon Mephistophiles in the form of a horse with the wings of a drone-dary, and next to many distant countries and famous cities, as Paris, Naples, Venice, and Rome. Here he torments and bewilders the pope with his strange enchantments, remaining three days invisible in the papal palace, seeing in the pope and his attendants countless sins like his own—shamelessness, audacity, pride, presumption, gluttony, drunkenness, luxury, adultery, and impieties of all kinds. At Constantinople he lives royally in the sultan's palace in the form of Mohammed, returning to Wittenberg after a year and a half's absence.

The third part, in twenty-eight chapters, narrates the conclusion of Faust's adventures, and especially the mighty deeds done by his necromancy at the courts of divers potentates. At Innsbruck he calls up the shades of Alexander the Great and his wife for the delectation of the Emperor Charles V., and afterwards plays many tricks upon his knights—planting a stag's horns on the head of one, devouring a peasant's load of hay together with the horse and wagon, and producing fresh apples and grapes in January; and at carnival time he revels with a company of students, drawing forth wine from a table, and raising Helen of Troy from the shades to gratify their eyes with the sight of her beauty. The story tells further of his debaucheries, and of the seven diabolical succubuses whom he made his concubines; and lastly of his liaison in the last year of his term with the famous Helen of Troy, who bore him a son whom he named Faustus junior. As the end approached he was filled with profound melancholy, seeing hell yawning before his eyes and its unutterable torments, from which there was for him no possible escape, while the wicked spirit now began to torment him with cruelly ironical rillery. On the night on which his twenty-four years expired he was in company with a group of students in a tavern of the village of Rimlich, near Wittenberg, and to them he made a long address expressing his deep penitence, after which he remained alone in his chamber. At midnight a fearful storm arose; horrible hisses as of a thousand serpents were heard, and for a little the agonising cries of Faust with a hollow and suffocated sound; but soon all was still. In the morning the floor of the room was found stained with blood, his brains were spattered upon the walls, and his body was found outside, lying near a daughill, the head and every member hanging half torn off. Helen and her child had disappeared, and the famulus Wagner succeeded as heir to his master's property. The history ends with an edifying conclusion.

This Volksbuch, which we have seen is not a product of the imagination, at once became popular, as many as four impressions being printed before the close of the following year. A second and corrected edition was published by Spies himself in 1588. In the same year a Low German rendering was published, and a close though somewhat shortened English translation before 1589, the earliest copies not being dated. See the reprint in vol. iii. of W. J. Thoms's *Early English Prose Romances* (2d ed. 1838). Danish, Dutch, Flemish, and French versions were also made—the last not till 1598. A Berlin edition of 1590 added six new chapters, of which one relates to the Leipzig tradition of Faust's adventures in Auerbach's cellar. A version of the book in rhyme, executed by Tübingen students, appeared there in 1588 (printed in vol. xi. of Scheible's *Kloster*, 1849). At Hamburg in 1599 was issued the second form of the popular book, the enlarged version of Widman (printed in vol. ii. of Scheible's *Kloster*, 1846). Many additional stories and details are here inserted, and each chapter concludes with an edifying discourse, called a *reminder* (*Erinnerung*), which reveals a violently Protestant bias, extorting everywhere a moral against Rome. A later version of Widman is that by the Nuremberg physician, Johann Nicol. Pfitzer (1674; new ed. by A. v. Keller, Stuttgart, 1880), which is chiefly interesting as containing the prototype of Goethe's *Gretchen* in the citizen's daughter whom Faust wishes to marry, but which the devil will not permit him to do. Yet another version was issued at Frankfurt about the beginning of the 18th century, by 'One with Christian Intentions,' in an abridged and modernised form, which was the basis of many widely diffused chapbook impressions (see

'Des Christlich Meynenden Ge-chielte Faust's,' in vol. ii. of Scheible's *Kloster*, from an edition dated 1728). The life of Christopher Wagner (Scheible's *Kloster*, vol. iii. 1846) was issued in 1593, and originated in the same year an imitation, rather than a translation, in English. It closely follows the form of Faust; Wagner is attended by an ape-shaped attendant devil named Auerban, has similar adventures to his master's, and in the end shares the same fate.

Independent poetic versions of the Faust story also began early to appear. Of these, the earliest, and still the greatest but one, was Marlowe's *Tragic History of the life and death of Doctor Faustus*. English itinerant players traversed Germany in the beginning of the 17th century, and may have carried with them Marlowe's magnificent tragedy, but the popularity of the theme was so great that it may well have inspired the native imagination also, and given rise to the numberless marionettes in which the story was continuously represented down to the present century. These were seldom printed, and usually largely extemporised, keeping at the same time more or less closely to the theme. See the excellent Ulm piece and others in vol. v. of Scheible's *Kloster* (1847); also the marionette versions edited by W. Hamn (1850; Eng. trans. by T. C. H. Hedderwick, 1887), O. Schade (1856), K. Engel (1874), Bielschowsky (1882), and Kralik and Winter (1885).

Lessing had projected two versions of the story, one close to the original legend, the other with the supernatural element eliminated; but of these only some fine fragments now exist. Klinger worked the subject into a romance, *Fausts Leben, Thuten, und Hollenfahrt* (1791; translated into English by George Borrow in 1826); and Klingemann published in 1815 his absurd tragedy, 'the hero of which,' says Carlyle, 'is not the old Faust driven desperate by the uncertainty of human knowledge, but plain John Faust, the printer, driven desperate by an ambitious temper and a total deficiency of cash.' Heine's ballet, *Der Doctor Faust, ein Tanzpoem*, appeared in 1851, and N. Lenau's really poetical epic-dramatic *Faust* in 1836. The *Faust* made known to the English public by Henry Irving was a free adaptation of Goethe's Part I. from the pen of Mr W. G. Wills (1885). Again, librettos for operas on the subject have been written by Bernard for Spohr (1814), and by Barbier and Carré for Gounod (1859).

Of artistic representations of Faust all the world knows the fine engraving by Rembrandt. Still older are those by Christoph von Sichel. The most famous illustrations to Goethe's *Faust* have been those of Cornelius, Retzsch, Seibert, Kaulbach, and Kreling. The first of the two ancient mural paintings in Auerbach's cellar at Leipzig represents Faust sitting at the head of the table during a revel; the second, as being by magical art carried out into the street sitting astride a wine-cask. Since Goethe's time many fresh paintings have been added to the two venerable studies, which are dated 1625.

But it is time to come to the greatest genius who has ever experienced the spell of this ancient legend. 'The marionette fable of *Faust*,' Goethe says, 'murmured with many voices in my soul. I too had wandered into every department of knowledge, and had returned early enough satisfied with the vanity of science. And life, too, I had tried under various aspects, and always came back sorrowing and unsatisfied.' Goethe had thought out his *Faust* as early as 1774, but did not publish the first part of his greatest work till 1808, the second till 1831. In his hands it has become a splendid masterpiece, the most really original, moreover, of all his works, although, indeed, in the details of the plot he has invented nothing. It will remain a magnificent

dramatic realisation of the elemental struggle between the higher and the lower natures in man. Impossible as it is to compare the English with the German *Faust*, it is still true that Marlowe's conception of the character has the stronger grasp of the actual. His *Faust* is always a man, real and living; Goethe's is often idealised and subtilised to the point of being a shadow, or rather a symbol.

See Sommer, in Part 42 of Ersch u. Gröber's *Encyclopädie* (1845); Düntzsch, *Die Sage vom Doctor Faustus* (1846); Ristelhuber, *Faust dans l'Histoire et dans la Légende* (1863), to be read with caution; and Dr Ernest Faligan's admirable work, *Histoire de la Légende de Faust* (1888), with its excellent 'index bibliographique' (pp. 433-452). A complete special bibliography of Faust literature is Karl Engel's *Zusammenstellung der Faust-schriften* (Oldenburg, 1885), containing 2714 numbers.

**Faust**, JOHANN, printer. See FUST.

**Faustina**, mother and daughter, wives of two of the noblest among the Roman emperors. The elder, Annia Galeria, usually spoken of as *Faustina Senior*, was the wife of Antoninus Pius, and died 141 A.D.; the younger, known as *Faustina Junior*, was married to his successor, Marcus Aurelius Antoninus, and died at a village near Mount Taurus in 175 A.D. Both, but particularly the younger, were notorious for the profligacy of their lives, yet after their deaths their memories were marked with signal honours by their forgiving husbands. Institutions for the relief of poor girls were founded by both emperors, and were called '*puella alimentaria Faustinae*.'

**Fauvette**, a name sometimes used for the birds called Warblers (q.v.).

**Favara**, a town of Sicily, 4 miles SE. of Girgenti, with sulphur-mines and marble-quarries. Pop. 15,983.

**Favart**, CHARLES SIMON, a French dramatist, was born at Paris, 18th November 1710, and first became known by his *La Chéruse d'Esprit*, performed in 1741. In 1745 he became director of the *Opéra Comique*, where he and his wife (a singer and actress, who had a share in the composition of several of her husband's plays) made the first attempt to harmonise the costume of the actors and actresses with their impersonations. This excited the jealousy of the other theatres, and the *Opéra Comique* was closed in the first year of its existence. After spending some time in Flanders, with a troupe of comedians, in the army under Marshal Saxe, Favart returned to Paris and continued to write operas. He died 12th May 1792. His most celebrated pieces are *Le Coq du Village*, *Bastien et Bastienne*, *Ninette à la Cour*, *Les Trois Sultanes*, and *L'Anglais à Bordeaux*. An edition of his works in ten volumes was published at Paris in 1810; *Les Mémoires et la Correspondance de Favart*, giving delightful glimpses of the literary and theatrical world of the 18th century, was published at Paris in 1809 by his grandson.—*Madame Favart* is the subject and the title of a popular comic opera (1878) by Offenbach.

**Faversham**, an ancient municipal borough and river-port of Kent, 52 miles by rail ESE. of London, and 10 WNW. of Canterbury, chiefly consists of four streets forming an irregular cross. It has a valuable oyster-fishery, and sends much agricultural produce to London. The creek on which it is situated admits vessels of 200 tons. In the vicinity are important powder-mills. Pop. (1851) 4595; (1881) 8743. Under the name of Faversfield it was a seat of the Saxon kings, where Athelstan in 930 held a Witenagemot. It has scanty remains of a Clugniac abbey founded (1147) by King Stephen, whose tomb is pointed out in the parish church. This is a fine cruciform building, Early English in style, with a spire 148 feet high. Near it is the

house of 'Arden of Feversham,' whose murder by his wife in 1551 forms the theme of an anonymous tragedy (1592; edited by A. H. Bullen, 1888). A grammar-school, founded in 1527, was rebuilt outside the town in 1879. In 1688 James II. was seized at Faversham, attempting to flee to France. See local histories by Jacob (1774) and Girard (1876).

**Favre**, JULES CLAUDE GABRIEL, a French advocate and statesman, was born at Lyons, 21st March 1809. He studied for the bar at Paris, and took an active part in the July revolution of 1830. As the defender of the *Mutuellistes* at Lyons in 1831, and in 1833 of those who had been impeached in April, he displayed a spirit of the most ardent and uncompromising republicanism; and in the February revolution of 1848 he wrote the notorious circular for which Ledru-Rollin's administration was so severely reproached, investing the commissioners of the republic with dictatorial authority in the provinces. On being elected deputy to the Constituent Assembly for the department of the Loire, Favre became a member of the Committee of Foreign Affairs, and advocated the prosecution of Louis Blanc. After the election of the 10th December he showed himself a persistent antagonist of Louis Napoleon, and after the flight of Ledru-Rollin became the virtual leader of the Mountain. The *coup d'état* closed his political career at this time, and compelled him to return to his profession. In 1858 he defended Orsini, on his trial for a conspiracy to murder; this procured his election as member of the Legislature for Paris, and he became one of the leaders of the republican party against Napoleon III. In September 1870, after the downfall of the empire, he was appointed minister of Foreign Affairs, and carried on negotiations, though fruitlessly, with Bismarck. But in January 1871, when settling the terms of the capitulation of the capital, he committed the very serious blunders of omitting Bourbaki's army from the armistice and allowing the National Guards of Paris, contrary to Bismarck's advice, to retain their arms, thus facilitating the outbreak of the Commune. He resigned office in July 1871, and resumed practice at the bar. Favre died at Versailles on 20th January 1880. He was greatest in political repartee, and though long accustomed to public strife, his language was noted for its Attic elegance. See Maritain, *Jules Favre, Mélanges Politiques* (1882).

**Favus** (Lat., 'a honeycomb'), a disease of the skin, chiefly of the hairy scalp, characterised by yellowish dry incrustations of more or less roundish form, and often cup-shaped, composed of the Sporules and Mycelia (q.v.) of a vegetable growth belonging to the order of Fungi (q.v.), with usually an unpleasant mousy odour. The discs of favus are produced with great rapidity, and spread rapidly, if not attended to at the first, over the whole scalp, destroying the bulbs of the hair, which becomes very short and thin, and then falls out altogether. Favus is a disgusting and unsightly, but hardly a dangerous disorder; it is, beyond doubt, contagious, but only spreads where cleanliness is greatly neglected, and is therefore almost unknown among the better classes. It is far more common among children than among adults, often affecting those in delicate health, and seems to be more frequent in Scotland than in England, and more frequent also on the Continent than in either England or Scotland. It seems to be gradually diminishing in frequency. On the general surface of the body it is easily cured; but on the hairy scalp its eradication is a matter of great difficulty. The treatment consists in careful removal of the crusts and scrupulous cleanliness, pulling out the hairs from affected parts by the roots, and the persevering.

employment of ointments containing a parasiticide. Resorcin, a substance allied to benzoic acid, is much praised by recent writers. General tonic treatment is usually necessary. Favus, if allowed to run its course unchecked, is almost always followed by permanent baldness of the parts affected; unlike Ringworm (q.v.), which is a minor disease of the same order.

The Favus fungus, *Achorion Schaeleinii*, is nearly allied to the fungus which is so destructive to vines, and has by some botanists been placed in the same genus, *Oidium*.

**Fawcett**, HENRY, was born in 1833 at Salisbury. His father, William Fawcett (born at Kirkby Lonsdale, Westmorland, in 1793), settled at Salisbury in early life, entered into business as a draper, married (1827) Mary, daughter of Mr Cooper, solicitor of that city, and was mayor in 1832. Henry was the third of their four children. His parents took a keen and active interest in politics and were decided Liberals. In 1841 Mr W. Fawcett took a farm at Longford, near Salisbury, under the then Earl of Radnor, one of the few anti-protectionist land-owners of that time. The political and social influences under which Henry Fawcett's youth was spent deeply affected his character and aspirations. As a mere lad at school he formed the intention of entering parliament, mainly in the hope that from that vantage-ground he would be able to do something to promote the education of the people and to improve the lot of the agricultural labourer. His natural impulses were far less for a life of study than for one of outdoor exercise and field-sports, which were his principal source of pleasure throughout life. He, however, succeeded in curbing his love for them sufficiently to devote the energies of his powerful mind to win success first of all in a student's life. For it was through a successful career at school and college, and afterwards at the bar, that he hoped to reach the House of Commons. Henry Fawcett was sent in succession to Queenwood College, Hants, King's College School, and King's College, London, and in 1852 to Cambridge, where in 1856 he graduated as seventh wrangler, and was elected to a fellowship at Trinity Hall. He commenced reading for the bar, and contemporary private letters show that he kept firmly to his boyish intention to enter parliament, and to work for a better time for agricultural labourers, natives of our Indian empire, and in general for all who were 'desolate and oppressed.' He was greatly influenced at this time by the writings of John Stuart Mill, and afterwards by his personal friendship. In September 1858 an event occurred which would have crushed all heart and hope out of any less dauntless spirit. When shooting partridges on Harnham Hill, near Salisbury, shots from his father's gun entered both Fawcett's eyes, and the beautiful scene on which he had looked a moment before was blotted out for ever. With characteristic courage he at once realised and faced the extent of his misfortune, and resolved that it should not prevent him from entering parliament. He never once complained, and immediately set himself to work to adapt himself to the altered conditions of his life. He gave up the bar; he had never looked upon it as anything but a stepping-stone to the House of Commons. He now determined upon a more direct pursuit of his ultimate object. 'Blind, poor, unknown, he would force his way into the House of Commons.' His first candidature was at Southwark in November 1860. He retired before the day of the poll; but he had kept up a spirited contest for a month, and done much to remove the impression that blindness was an insuperable obstacle to a parliamentary career. His next fight was at Cambridge in

January 1863, where he went to the poll, but was defeated by the Conservative candidate. About this time he brought out the result of several years' work, his *Mannual of Political Economy*, a textbook based mainly on the lines laid down by Ricardo and J. S. Mill: the book has passed through a very large number of editions. The opportune appearance of this work no doubt contributed to his election to the chair of Political Economy in the university of Cambridge in the autumn of 1863, a post which he held without interruption till his death. The best known of his other writings are *The Economic Position of the British Labourer and Protection and Free Trade*. In 1864 he fought a contested parliamentary election at Brighton, and was defeated; but he had gained a hold on the constituency which led to his return in the general election of the following year; in June 1865 his boyish ambition was fulfilled, and he entered parliament as member for Brighton, and was again returned for the same place in 1868. In April 1867 he married Millicent, daughter of Mr Newson Garrett of Aldeburgh, Suffolk. They had one child, Philippa, born in 1868.

Henry Fawcett's candidature in his various electoral contests had not been favourably regarded by the wire-pullers of his own party; and from the beginning of his active political life he showed an independence of party ties and a disregard of party discipline which were often misconstrued as half-hearted Liberalism. His first step in the direction of political independence was joining the so-called 'Tea-room' party, which virtually insured the passing of Mr Disraeli's Household Suffrage Bill of 1867. He had pledged himself to support the extension of the suffrage, and he did not wish to refuse household suffrage because it was offered by the Conservative party. He devoted himself to urging forward measures for the abolition of religious tests at the universities, to the extension of the factory acts to agricultural children, and to the promotion of universal compulsory education. He also took up two questions with which his name will always be identified, the preservation of commons and open spaces, and the government of India and the condition of its native populations. In all these questions his chief foes were among the leaders of his own party, and the friction between him and them became so acute that the parliamentary secretaries to the Treasury ceased to count him as a member of the party. Fawcett regarded with special distrust Mr Gladstone's attitude with regard to religious tests in education. When Mr Gladstone brought forward his Irish University Bill in 1873, Fawcett offered it a most uncompromising opposition. One of its features which he most strongly condemned was contained in the so-called 'gagging' clauses, which prohibited the teaching of modern history, philosophy, and theology in the new university. The debate on the second reading resulted in the defeat of the bill by three votes, and Mr Gladstone's government received a blow from which it never rallied. After this a bill introduced by Fawcett for the abolition of tests in Trinity College, Dublin, became law. In the general election of February 1874 Fawcett lost his seat for Brighton; but his parliamentary position was now assured, and friends and foes alike deplored his absence from the House of Commons. His geniality and straightforwardness prevented him from having any personal enemies, and those who differed from him the most widely were among the most eager to welcome him back to the House of Commons. Through an informality in the Hackney election of February 1874, the seats were declared vacant, and Fawcett became member about six weeks

after his defeat at Brighton. The Liberal party having suffered a great reverse in the general election of 1874, the causes which had separated him from the official heads of his party were removed, and he joined cordially with them in opposition to the policy adopted by Lord Beaconsfield's government in reference to the Eastern Question. He continued his work for India, and was popularly known as 'the member for Hindustan.' He also pursued his efforts for the preservation of open spaces; and the retention of Epping Forest, the New Forest, and other regions of silvan beauty is a debt which the nation owes, in part at least, to the labours of one whose eyes could never behold them. While supporting the Factory Acts in their application to children, he was an opponent of legislative restrictions upon the industry of women, and a warm supporter of the claims of women to the protection of representation. He also supported various forms of proportional representation. He always took a lively interest in the welfare of Ireland, and hoped that much good would come of efforts to allay religious animosities in that country; he also looked for benefit resulting from the creation of a peasant proprietary and from the development of the industrial resources of Ireland. He never supported the Home Rule party, as he believed a separate parliament for Ireland would be injurious both to that country and to England. When Mr Gladstone was returned at the head of a large parliamentary majority in 1880, Fawcett had again been elected for Hackney by 18,366 votes against 8708 given for his opponent. Mr Gladstone offered him the Postmaster-generalship in his government, but without a seat in the cabinet. It was generally felt that his political position entitled him to cabinet rank, but fears were expressed that his blindness would render it impossible for him to guard cabinet secrets with the requisite jealousy. He accepted the decision with cheerfulness, but by no means regarded it as final.

His situation was not an easy one, for his official position prevented him from criticising the government, while he had no voice or control of any kind in the preparation of its measures. He would have found the position unbearable but for the extraordinary vigour with which he threw himself into an entirely new field of work, the administration of a great government department. Before he had been a fortnight at the Post-office he had set before himself the task of carrying out five reforms: (1) the introduction of the parcel post; (2) the introduction of postal orders; (3) a scheme for encouraging small savings; (4) the promotion of life-insurance; (5) sixpenny telegrams; and these, with the one exception of the life-insurance scheme, he was able to set on foot in such a manner as to insure their successful working. He was the antithesis of red-tape and officialism; he regarded himself and his department as nothing but the servants of the public; and every act of his official life was influenced by the conviction that his duty was to serve the convenience and interests of the public by all means in his power. He refused to regard the General Post-office simply as a department of revenue, and held that the outlying districts where the delivery of letters, &c. was a source of expense should have postal facilities granted to them out of the surplus revenue yielded by populous regions. His care for the well-being of every member of the immense staff of the Post-office (90,000 persons) was manifested in a variety of ways; he instituted an annual week's holiday for country postmen, improved the pay and conditions of employment of several branches of the service, encouraged and extended the employment of women, appointed

female medical officers for the female staff in London, Liverpool, and Manchester, and extended the system of good-conduct stripes carrying an extra shilling a week with them from the town to the country letter-carriers. If the humblest employé had to be censured or dismissed, Henry Fawcett would spend hours in most careful weighing of all the evidence, and he would be completely unable to rest or think of anything personal to himself unless he were thoroughly convinced that justice had been done. This sensitiveness on his part to his duty to the public and to the well-being of his staff won him the most devoted affection in all ranks. A serious illness in 1882-83 revealed for the first time the place he had gained, not only as an upright politician but as a man, in the gratitude and affection of his countrymen and countrywomen. He seemed completely to recover; his immense frame (his height was 6 ft. 3 in.) appeared as stalwart as ever, and he took pleasure in riding, fishing, swimming, skating, &c. as of old. But the first illness had probably weakened him more than any one perceived. In the autumn of 1884 he caught a severe cold which turned to congestion of the lungs, and he died after a few days' illness, November 6, 1884. His most memorable characteristics were his chivalrous nature and his power of entering into pain and loss, as well as into pleasures which he could never share. It was this that made him the friend of women seeking to earn an honest living; of agricultural labourers going to bed at sundown because they could neither read nor write; of natives of India living on 3d. a day, and paying taxes on one of the first necessities of life; and it was this that made him strive to preserve the open heaths and lovely forests, although his own eyes could never enjoy them. He sometimes said of himself that he had no imagination; but there were those who thought that it was a very true and rare kind of imagination which enabled him so vividly to realise what made the happiness or unhappiness of lives very far removed from his own.

He was buried at Trumpington, near Cambridge. A national memorial has been erected to him in Westminster Abbey. See Leslie Stephen's *Life of Henry Fawcett* (1885); and his article in the *Dictionary of National Biography* (vol. xviii. 1889).

**Fawkes, GUY**, conspirator, was born in York of Protestant parentage in 1570. Becoming a zealous Catholic before he was of age, he served in the Spanish army in the Netherlands from 1593 until 1604, when he crossed to England at Catesby's invitation. For his share in the Gunpowder Plot (q.v.) he was hanged 31st January 1606.

**Fay, ANDRÁS**, a Hungarian poet and author, was born on 30th May 1786 at Kohány. He was educated for the legal profession, but abandoned it for literature, writing fables, plays, romances, and tales. The fables show richness of invention, simplicity of design, and truth of character. Of the novels the most interesting are *The House of the Beltekis* (1832) and *Doctor Javor* (1855), both humorous. From 1825 to 1840 Fay was one of the chief leaders of the Liberal opposition. He was the founder of the first savings-bank at Pesth, and one of the founders of the Hungarian national theatre. His earlier works were published in eight volumes at Pesth, 1843-44, and his novels in three volumes in 1833. He died 26th July 1864.

**Fayal**, one of the Azores (q.v.). The island (area, 69 sq. m.; pop. 26,264) is fertile, has a mountain 3000 feet in height, and on its south-east coast a bay with good anchorage, on which stands the town of Horta.

**Faye, HÉRY AUGUSTE ETIENNE**, French astronomer, born in 1814 at St-Benoît-du-Sault,

studied under Arago, and became in 1873 professor of Astronomy at the École Polytechnique, and in 1878 director of the Paris Observatory. In 1843 he discovered the comet now known as Faye's comet.

**Fayetteville**, capital of Cumberland county, North Carolina, at the head of navigation on the Cape Fear River, 82 miles by rail (55 direct) S. of Raleigh. It contains several cotton-mills, and exports large quantities of tar and turpentine. Pop. 3485.

**Fayyûm** (from Egypt. *Phiom*, 'marsh-land'), a province of Egypt (pop. 160,000), consisting of a nearly circular basin or oasis, about 30 miles in diameter, or 840 sq. m. in area, sunk beneath the level of the Libyan desert, about half a degree S. of Cairo, and connected with the Nile valley by a narrow pass, through which an ancient canal (the Bahr-Yûsuf, or 'Joseph's stream,' so named after Saladin, who restored an original construction of the Theban Pharaohs) pours the fertilising water which renders the Fayyûm one of the most productive parts of Egypt. The irrigation was anciently regulated by a large reservoir, called Lake Mœris (q.v.), described by the Greeks as a work of extraordinary hydraulic ingenuity (the site of which was identified by Linant near the modern capital Medinet-el-Fayyûm, though other sites have been proposed by Mr Cope Whitehouse and others), and the overflow now forms the large sheet of brackish water, 35 miles long, known as the Birket-el-Karn, which marks the eastern boundary of the oasis. On the banks of Lake Mœris was the famous 'labyrinth,' probably built by Amenemhat III., and reckoned one of the wonders of the world. The remains of this vast palace are seen in the ruins of numerous chambers near the brick pyramid of Hawâra. The capital of the Fayyûm was Crocodilopolis, afterwards named Arsinoë, after the queen of Ptolemy Philadelphus, near the site of which is the modern chief town (pop. 10,000). Filimin is a picturesque village in the Fayyûm. Recent explorations by Mr Petrie and others have revealed more interesting remains of antiquity in the province than had formerly been suspected. The Fayyûm abounds in fruit, oranges, peaches, pomegranates, olives, figs, grapes, &c., and is famous for roses and other flowers. The inhabitants are chiefly agriculturists and fishermen. The fields yield splendid crops of cereals, besides rice, cotton, sugar, flax, and hemp. For an account of excavations in the Labyrinth, the ruins at Hawâra, &c., see W. M. Flinders Petrie's *Hawâra, Biahma, and Arsinoë* (1889).

**Fazy**, JEAN JAMES, Swiss journalist and publicist, was born at Geneva, 12th May 1796. His early life was spent in Paris, where he acted as a political journalist in the ranks of the Liberal opposition. Returning to Geneva in 1833, he founded the *Revue de Genève*, and became the leading spirit in the radical movement which resulted in the new constitution of 1846. From this latter year until 1861 he was the real ruler of Geneva, and it is due to his influence that the city has of late years been enriched with numerous fine public buildings. Fazy died on 5th November 1878. He wrote a *History of Geneva* (2 vols. 1838-40), and a *Treatise on Constitutional Legislation* (1874).

**Feal and Divot** (words both meaning turf), in the law of Scotland, are usually conjoined with the word Fuel, as 'Fuel, Feal and Divot,' to denote the rural servitudes which give right to the proprietor of the dominant tenement to dig and win peat and turf from the servient tenement for fuel, or for building fences, or thatching houses, or similar purposes. They involve also a right of access to the peat-ground, and a right of using the ground to dry the cut turf.

**Fear**. See FORCE AND FEAR.

**Fear**, CAPE, the most southerly point of North Carolina, forms the southern extremity of Smith's Island, at the mouth of the Cape Fear River. It has a lighthouse, with a light 110 feet above the sea.—Cape Fear River, formed by the Deep and Haw rivers, runs south-east, and enters the Atlantic after a course of 250 miles, more than half of which is navigable for steamboats; it is the largest river whose course is entirely within the state.

**Feasts**. See FESTIVALS.

**Feather-grass** (*Stipa*), a genus of grasses remarkable for the long awns which give a peculiar and very graceful appearance to the species, mostly natives of warm temperate climates, and including Esparto (q.v.). *S. pennata*, *S. capillata*, and *S. elegantissima* are favourite ornaments of gardens. When gathered before the seeds are ripe, its feathery awns remain attached, so that the tufts retain their beauty throughout winter. The feathery awns not only assist in the diffusion of the seed, which is carried by the wind to great distances, but in a very interesting manner help to fix it in the soil. Being very hygroscopic, the awn lengthens or shortens with each change of moisture, and each lengthening thus tends to push the sharp pointed grain a little into the earth, its return being prevented by barbed hairs. The awns are hence sometimes used to make rough hygrometers.

**Feather River**, California, a feeder of the Sacramento, rises in two forks in the Sierra Nevada, and has a southerly course of about 230 miles. It is navigable for steamboats to Marysville, and large quantities of gold have been found on its banks.

**Feathers**, modified outgrowths of integument, characteristic of birds, and belonging to the same series of skin-structures as the scales of fishes and reptiles and the hairs of mammals. Even Aristotle suggested the parallelism of fish-scales and bird-feathers, and modern knowledge of the development has proved the fundamental similarity or homology of all the three types of integumentary outgrowth. Feathers must have been very early acquisitions of birds, since the most ancient form we know of—*Archæopteryx* from Jurassic strata—already possessed them.

**Structure**.—An ordinary feather exhibits two principal parts—axis and barbs. The axis is divided into a bare, hollow, inferior portion—the quill, and a barb-bearing, solid, upper part—the shaft. At its base the quill is partly imbedded in a small sac of the skin, and shows at the very end a small aperture for the entrance of the nutritive vascular pulp. The barbs or small plates, which together form the vane, are linked together by pointed lateral barbules, which may be again interlocked by minute hooklets. Each barb with

Fig. 1.—Feather from the back of *Argus giganteus*:

a, shaft (rachis); b, barbs forming the vextillum, removed from one side of both shaft and undershaft; c, barbules on the barbs; d, after-shaft (after Nitzsch).

The barbs or small plates, which together form the vane, are linked together by pointed lateral barbules, which may be again interlocked by minute hooklets. Each barb with

its barboles is thus itself like a little feather. In the ostrich family the barbs, though possessing barboles, are free, and the familiar loose plume results. In a great many birds the quill bears a second shaft, rising at the base of the vane. This is usually small, but in the cassowaries and a few other birds main shaft and 'aftershaft' are almost equal, and the feather is thus distinctly double.

*Relation to the Skin.*—Only in a few birds—e.g. the ostrich tribe and the penguins—do the feathers occur all over the surface; usually they are restricted to 'feather-tracts' between which the skin is bare or at most downy. Each feather is imbedded in a sac, readily obvious on a plucked bird, and with this sac are associated unsele fibres, more or less abundant, serving to erect the feather. Unlike hairs, feathers have no sebaceous glands associated with them; they are, however, anointed by the secretion of the 'preen-gland' on the tail.

*Kinds of Feathers.*—The most conspicuous feathers clothing a bird are such as have been above described—'contour feathers,' or *pennae*. Among these, however, there are down-feathers or plumes, in which the barbs remain soft and free from one another. These are the first feathers, for a time abundant on young birds, but gradually for the most part ousted and replaced by the ordinary forms. Besides these are still simpler and smaller feathers with a long shaft and a rudimentary brush of barbs—the 'filoplumes.' In addition to these common forms there are numerous peculiar modifications of restricted occurrence. Thus, in herons and some other birds small down-feathers occur, 'the summits of which break off into a fine dust or powder as fast as they are formed,' and give rise on certain parts of the skin to 'powder-down patches.' In many aquatic birds an almost fur-like down is very common, the minute component feathers having only a slight development of shaft. In great contrast are a few strong quills on the cassowary's wing, where the long shaft is quite destitute of barbs.

*Development.*—The cells of the under-skin or dermis multiply and push out the epidermis into a papilla. As the papilla elongates into a cone, its

Fig. 2.—The Development of a Feather (from Wiedersheim and Parker, mainly after Studer):

A, an early stage of the feather papilla and follicle; B, the papilla breaking up into a tuft of barbs; C, the quill and primary rays or barbs, with indications of barboles; D, the thickening of one of the rays to form the stem of the vane. a, pulp of dermis; b, outer or horny layer of epidermis; c, inner or Malpighian layer of epidermis; d, feather-follicle.

base sinks and becomes surrounded by a moat-like depression, the feather-follicle or sac. The core of the cone, consisting of dermis, is a nutritive pulp; the sheath of the cone, consisting of epidermis, forms the feather. But here as elsewhere the epidermis has two layers—an outer or horny, an inner or Malpighian stratum (see SKIN). The inner layer forms the real feather; the outer layer is only a protective sheath which is eventually shed. 'The cells of the Malpighian layer multiply

rapidly, giving rise to a series of radial folds along a central axis, which extend inwards towards the pulp, and are externally then bounded by the horny layer. These folds then become cornified and separated from the surrounding cells, and by a gradual drying of the central pulp-substance give rise to a tuft of horny rays, which are, however, at first bound together by the enclosing outer layer.' After hatching, the sheath is shed and the barbs set free; the undivided lower part remains as the quill; the barbs develop barboles; the result is an embryonic down-feather.

The more permanent feathers have an essentially similar history. From the base of the first follicle a second is formed; the growing papilla within the latter onsets the embryonic feather and replaces it; one of the rays formed as above described 'becomes rapidly thickened, and forms the main axis or stem, to which the barbs are attached on each side.' The result is an ordinary penna or contour-feather.

*Growth and Shedding.*—When in process of formation, feathers are of course genuinely alive; the vascular nutrient core of dermis keeps up the supply. They grow with great rapidity, and in some birds attain a length of more than two feet. When fully formed, however, the pulp dries and shrivels, and the feathers become virtually dead from tip to base. They usually last only one year, being replaced by a fresh growth, which generally occurs at the end of the reproductive period. This process of moulting is in a general way equivalent to the 'skin-casting' of reptiles and the shedding of hair in mammals, but its physiology is not yet understood. Involving no little expenditure of vital energy, generally occurring after the already severe strain of reproduction, brooding, and parental care, moulting is frequently associated with mortality, but when successfully accomplished is obviously of great advantage in repairing the injuries of the past and in equipping the birds afresh for migratory flight or the ordinary business of life (see BIRD).

*Colour.*—Feathers excel hairs and scales in the richness and variety of their colouring. This is usually most prominent in the male birds, but is emphasised in many cases only when sexual maturity is attained. Very often the bright colouring is acquired along with other decorations in a spring moult before the breeding period. The colour is due to the presence of pigment, but is greatly enhanced by physical peculiarities, such as markings on the barbs and the occurrence of air-spaces (see PIGMENT).

In regard to the general physiology of feathers but little can be said. Their utility as a clothing for the skin and as organs of flight is evident enough, but the conditions determining the historic and individual development of these most highly-evolved skin-structures are quite obscure. It is noteworthy, however, that this climax of integumentary outgrowth occurs in animals living a very active life, with the highest body-temperature, and with peculiarly thin skin almost devoid of the usual glands.

*Industrial Uses.*—Feathers are still largely used as Quills (q.v.) for writing, for holding the sable hairs of artists' brushes, and for toothpicks. Much more important is their use for stuffing beds, quilts, and cushions, when dried and cleaned; the feathers and down of the Eider-duck (q.v.) being most highly esteemed, and after them those of geese, swans, and poultry. The feathers of most kinds of birds are used for personal ornament, often after being washed, bleached, dyed, curled, or made up. Ostrich (q.v.) feathers are the most notable for ornamental purposes, and it is for its feathers alone that it is reared. Other feathers for various kinds of ornament are those of the American ostrich or

reha, adjutant, bird of paradise, humming-bird, albatross, grebe, and penguin (see the articles on these various birds). The value of ornamental feathers and bird skins imported into the United Kingdom increased from £800,000 in 1875 to over £2,000,000 by 1885. Feathers are often wrought into ingenious artificial flowers.

See BIRD, FLIGHT, HAIR, PIGMENT, SKIN. Nitzsch, *Pterylography*, trans. by Schlater, Ray Soc. (1867); R. Wiedersheim and W. N. Parker, *Comparative Anatomy of Vertebrates* (Lond. 1886); Huxley, 'Tegumentary Organs,' Todd's *Cyclop.* vol. v. (1839); T. Stüder (Development), *Zeitschr. wiss. Zool.* vol. xxx.

**Febrifuge** (Lat. *febris*, 'a fever,' and *fugo*, 'I drive away'), a medicine calculated to remove or cut short Fever (q.v.).

**Febronianism**, a system of doctrine antagonistic to the claims of the Roman pontiff and asserting the independence of national churches, propounded in 1763 by Johann Nikolaus von Hontheim (q.v.), under the pseudonym 'Justinus Febronius.'

**February**, the second month of the year, contains in ordinary years 28 days, but in leap-year it has an additional or intercalary day. Until the time of the Decemvirs it was the last month of the Roman year. Its name was due to the fact that during this month (15th) was held the *Lupercalia* (q.v.) or *Februa*, the great feast of expiation and purification. The word *februum* ('a means of purification') appears to have been of Sabine origin.

**Fécamp**, a manufacturing town and seaport in the French department of Seine-Inférieure, is situated in a narrow valley, flanked on either side by steep cliffs, at the mouth of a little stream, 28 miles NNE. of Havre by rail. It consists mainly of one long street, and has a fine abbey church (c. 1220) in the Early Pointed style, rich in painted glass, monuments, and carved woodwork. The harbour is frequented by colliers from Newcastle and Sunderland, by Baltic timber-ships, and by fishing-vessels. Fécamp has cotton-mills, sugar-refineries, tanneries, shipbuilding-yards, and some linen-cloth and hardware manufactures. Pop. (1872) 12,631; (1886) 12,487.

**Fechner**, GUSTAV THEODOR, one of the principal German writers on the subject of psychophysics, or the relations and laws that obtain between the mental and the physical sides of man's nature, was born at Gross-Sachsen in Lower Lusatia, 19th April 1801. After studying physics at Leipzig, he became professor of the sciences comprehended under that name in the same university in 1834, his labours being principally devoted to galvanism, electro-chemistry, and the theory of colour. Five years later, however, in consequence of a disease of the eyes, he abandoned these branches for that of philosophy and psychophysics. His most important book on this subject is *Elemente der Psychophysik* (2 vols. 1860), whilst on galvanism he wrote *Massbestimmungen über die galvanische Kette* (1831), and brought out an enlarged translation of Biot's *Handbook of Experimental Physics* (5 vols. 1828-29). Besides these he wrote some books on belief and on the soul, and under the pen-name of Dr Mises published a number of smaller miscellaneous works, including a volume of *Humorous Essays* (1824) and another of *Poems* (1842). In *Mind* for 1876 will be found a paper on Fechner's psycho-physical law by James Ward. Fechner died 18th November 1887.

**Fechter**, CHARLES ALBERT, an actor of eminence, was born in London, 23d October 1823, his father being a Frenchman of German extraction, his mother an Englishwoman. When only three or four years old he went with his parents to France, and was there educated as a sculptor. His predilections were, however, in favour of the stage;

and, making his *début* in 1840, he soon became a popular actor. In 1860 he appeared in London with great success in an English version of *Ray Blas*, and next year astonished Londoners by his powerful impersonations of Hamlet and of Othello, departing widely from stage traditions. Subsequently Fechter became the lessee of the Lyceum Theatre, playing the chief part in most of the pieces produced. In 1869 and 1872 Fechter paid visits to the United States, where he thenceforward remained. He was not successful as a manager in Boston. He died at his farm near Quakertown, Pennsylvania, 5th August 1879.

**Fecundation**. See FERTILISATION.

**Federalists**, a political party formed in the United States in 1788, whose members claimed to be the defenders of the constitution and of the federal government, in opposition to the Republicans or Democrats (q.v.), whom they dubbed Anti-federalists. Besides Washington and John Adams, Hamilton, Jay, and Marshall were among its leaders. Its fate was sealed by the holding of the Hartford Convention (q.v.), and by 1820 the Federalists, as a national party, had disappeared.

**Federation**. When several states, otherwise independent, bind themselves together by a treaty, so as to present to the external world the aspect of a single state, without wholly renouncing their individual powers of internal self-government, they are said to form a Federation. The contracting parties are sovereign states acting through their representatives; and the extent to which the central overrules the local legislatures is fixed by the terms of the contract. In so far as the local sovereignty is renounced, and the central power becomes sovereign within the limits of the federated states, the federation approaches to the character of a Union; and the only renunciation of sovereignty which a federation as such necessarily implies consists in abandoning the power which each separate state otherwise would possess of forming independent relations with foreign states. 'There are,' says Mr Mill, 'two different modes of organising a federal union. The federal authorities may represent the governments solely, and their acts may be obligatory only on the governments as such, or they may have the power of enacting laws and issuing orders which are binding directly on individual citizens.' The former was the plan of the German so-called confederation, and of the Swiss constitution previous to 1847. 'The other principle is that of the existing constitution of the United States, and has been adopted by the Swiss confederacy. The federal congress of the American Union is a substantive part of the government of every individual state. Within the limits of its attributions, it makes laws which are obeyed by every citizen individually, executes them through its own officers, and enforces them by its own tribunals. This is the only principle which has been found or which is even likely to produce an effective federal government. A union between the governments only is a mere alliance, and subject to all the contingencies which render alliances precarious.' Federalism is opposed to Centralisation (q.v.). See GOVERNMENT, and UNITED STATES; and for schemes of federating the British colonies in an imperial confederation, see COLONY.

**Fee**; **Fee-simple** and **Fee-tail**. The term fee is derived from *feudum*, a feudal holding; but in English law it has now no reference to tenure; fee means an estate of inheritance in land. The person who has the fee is entitled not only to the annual profits, but also to the corpus of the land; he may sell or otherwise dispose of it, and he may commit acts of waste, which impair its permanent value. If he dies owner in fee, the land will go to his heirs

or to the person entitled under his will (in legal phrase, the devisee). If a man holds 'to him and his heirs,' he is owner in fee-simple; he has the largest estate known to the law. But a fee-simple may be made *determinable*, as if land be given 'to A and his heirs, lords of the manor of Dale;' in this case, if A or any of his heirs ceases to be lord of that manor, the estate, and all interests derived from the owner of the estate, will come to an end. A fee-simple may also be made *conditional*, to vest only on the happening of an event. In early times, if land was given 'to A and the heirs of his body,' or 'to A, if he shall have an heir of his body,' the judges held that the fee was conditional; as soon as the condition was fulfilled (as soon, that is, as a child was born to A), the donee became owner in fee-simple, with full power to alienate the estate. In 1285 the lords and great men of the kingdom procured an act, commonly known as the statute *De Donis Conditionalibus*, whereby it was provided that in such cases the land should descend to the heirs of the body, according to the form of the gift. The statute therefore restricted the right of alienation, and limited the succession to a particular class of heirs. An estate given with words limiting it to heirs of the body was therefore called a fee-tail (*taille*, 'cut down or limited'). The strict rules of the statute remained in force until means were devised for breaking entails. See **ENTAIL**. It is to be observed that, when heirs are mentioned in limiting an estate, the heirs themselves take nothing directly; thus, an estate given to A and his heirs means simply an estate of inheritance given to A. If land be granted to A and his heirs in trust for B and his heirs, the legal fee is in A the trustee, and the equitable fee in B the beneficial owner. An estate in fee may be given by will without technical words of limitation; but in a deed it is necessary to mention heirs or heirs of the body, or to use the words 'in fee-simple,' or the words 'in tail.'

In Scotland the term fee signifies the property in land granted to be held by feudal services. *Fee* is also used as a correlative to *lifrent*, to signify the corpus or full ownership of land or money. In some cases the fee is vested in a person whose beneficial interest does not extend beyond his life; his 'admiralty fee' corresponds to the 'legal fee' of English law.

**Feeling.** See **EMOTION**.

**Fees.** Neither a barrister nor an advocate can take legal proceedings against his client for the recovery of his fees, even under a special contract. The case of *Kennedy v. Brown* (13 *Common Bench Reports*, N.S., p. 677) clearly established this doctrine: 'The relation of counsel and client,' it was laid down, 'renders the parties mutually incapable of making any legal contract of hiring and service concerning advocacy in litigation.' There is nothing, however, to prevent an advocate recovering fees earned by him, by the exercise of his professional knowledge where the relation of counsel and client did not exist between the contracting parties—e.g. by acting as arbitrator or returning officer. There is some, but not strong, authority for the proposition that an express promise to pay fees might be enforced by a barrister against a solicitor who had actually received them from the client. On the other hand, a solicitor is entitled under his general retainer to employ and pay counsel; and fees so paid can be recovered by the solicitor from his client, or from an unsuccessful adversary. No action lies to recover back fees given to a barrister to argue a cause which he did not attend. Special pleaders, equity draftsmen, and conveyancers who have taken out certificates to practise under the bar, and are not therefore counsel, may recover their reasonable charges for

business done by them. Barristers' and advocates' fees are paid before being earned. This rule, by removing from members of the bar all pecuniary interest in the issue of suits, has done much to maintain its independence and integrity.

In the United States the two branches of the legal profession are not separated as in England. A barrister is entitled to recover his fees, and is liable to be sued for professional incompetency or negligence. Nor is there anything illegal or improper in an American counsel agreeing to let the payment of a fee by a poor client depend on the issue of his action.

In France an action by a barrister for his fees is maintainable, but in most of the French bars such a proceeding is rigorously discountenanced, and in Paris it would lead to dishonourment. The fees of French advocates are now usually paid in advance, and any bargain between an advocate and his client which made the amount depend upon the issue of an action would be regarded as most dishonourable.

The theory that an advocate's services ought to be given gratuitously arose at Rome. To defend his client was one of the duties incumbent upon a patron, and it was all the more readily and faithfully discharged when forensic eloquence was perceived to be an avenue to political power. The Cincian law (204 B.C.), in which the receipt of pecuniary reward by an advocate was simply prohibited, gave expression to the prevalent public feeling upon the subject at this time. The Cincian law was first systematically evaded, and was then practically repealed by a decree of the Emperor Claudius, which limited the maximum fee which an advocate might receive to 10 *astortia* (about £78). The old Roman idea that the gifts of eloquence and persuasion should not be sold has made itself felt in the restrictions imposed by law or custom upon an advocate's power to bargain for fees or to secure their payment.

By the common law of England, a physician could not recover his fees by an action at law; but this rule was repealed in 1849.

The members of the inferior branches of both professions, such as solicitors, apothecaries, and dentists, have never been prevented by any rule of law from taking legal proceedings for the recovery of their charges.

**Fehrbellin**, a town of Prussia, with 1920 inhabitants, 40 miles NW. of Berlin by rail. Here on 28th June 1675 the Swedes under Wrangel were disastrously defeated by the Great Elector, Frederick William, with a loss of 2100 men. A tower (1875-79) marks the battlefield.

**Feith**, RUDOLPH, a Dutch poet, was born 7th February 1753, at Zwolle, in Overijssel. He studied law at Leyden and settled in 1772 at his native place, of which he became mayor in 1780, and where he died on 8th February 1824. Feith tried almost all kinds of poetry. In 1792 appeared *Het Graf* ('The Tomb'), a didactic though sentimental poem; in 1802, *De Ouderdom* ('Old Age'); in 1796-1810, four vols. of lyrical pieces marked by a high enthusiasm and warmth of feeling. Of his tragedies the best known are *Thirza* (1784), *Johanna Gray* (1791), and *Ines de Castro* (1793). Of Feith's prose works the most important are his *Brieven* ('Letters on Different Subjects,' 6 vols. Amst. 1784-94), which by their polished style and refined criticism did much to improve the literary taste of Holland. His complete works (1824) fill 11 vols.

**Felaniche**, or **FELANITX**, a well-built town of the island of Majorca, is situated in a mountain-girdled valley, which produces wine. The making of water-jars and brandy-distilling are carried on, and wine is exported. Pop. 11,018.

**Felegyhaza**, a town of Hungary, 80 miles SE. of Pesth by rail, has an extensive trade in grain, fruit, wine, tobacco, and cattle. Destroyed by the Turks in the 17th century, it was not rebuilt until 1743. Pop. 23,912.

**Felidæ**, a family of carnivores in the digitigrade or uluroid section, corresponding to the genus *Felis* of Linnæus, and to what we commonly call the cat tribe. They include the most carnivorous of Carnivora, excelling the less specialised forms, just as falcons and eagles are in a similar direction more perfect than many other less predacious birds. Their chief characteristics of habit and structure may be taken together, being obviously complementary.

Conspicuous for their muscular development, they express this most characteristically in the sudden leaps and bounds to which they trust after stalking their prey with all the cunning of true hunters. They crawl stealthily on noiseless, velvety paws, or patiently lurk for passing victims; at the fit moment occurs a sudden, almost explosive, out-pur of reserved energy, a great bound, a yell inspiring terror, a blow or two with the powerful forelimbs, and the sharp canines and sharper retractile claws begin their murderous work on the struggling prey. With the exception of the lion, the Felidæ are more or less arboreal, and make good climbers.

Characteristic Features of the Felidæ:

a, tiger's head; b, portion of tongue; c, right fore-paw, showing claws; d, claw, showing tendons. For dentition, see article CARNIVORA.

The body is rather long, and very lithe and graceful; the limbs are rather short, except in cheetahs and lynxes; the tail varies from a long appendage to a mere stump. They are the most digitigrade of carnivores—i.e. they walk on the tips of their (five) fingers and (four) toes. Under a glove of velvet they have claws of iron—strong, much curved, very sharp, and retractile; withdrawn by special muscles and ligaments into sheaths when not in use, and their points even turned upwards, so that they are not blunted by unnecessary friction, and do not interfere with the movements of the animal by hooking objects which are in the way. The collar-bones or clavicles, though unattached to shoulder or sternum, are better developed than in other carnivores.

The Felidæ never bury or store their dead prey, but often drag it off to some place of shelter, and in so doing exhibit enormous strength. The leaps of a lion can take with a mouthful half as big as itself are herculean marvels. Besides the strength of grip, the powers of rending and mastication are equally well developed. Thus, we find a skull which tends to be short, broad, and rounded, with large posterior ridges for the fixing of muscles, and

with a wide cheek (zygomatic) arch in which lie the relatively enormous muscles working the jaws. The latter form powerful short levers, and the articulation is such that only an up and down, and no rotatory, motion is possible.

The teeth are well adapted for their work, the chief features in the dentition being the large size, strength, and sharpness of the canines, and the two specially adapted cutting teeth ('carnassials' or 'sectorials')—viz. the last premolar above and the single molar below, which are both compressed into sharp blades. The front teeth are relatively small, and so, but more markedly, is the molar on the upper jaw. The numerical relations of the teeth may be summed up in the formula

$$\frac{3131}{3121} = 30.$$

The well-known character of the tongue, most conveniently exemplified in the cat, is also to be associated, as far as utility is concerned, with the carnivorous diet. It is thickly covered with sharp, recurved, horny papillæ, strong enough to rasp off the skin and draw blood from the hand, and obviously useful in clearing the flesh off the bones of victims. As is usual in carnivorous animals, the cæcum of the intestine is small and simple. The food varies widely, from the large ruminants attacked by lions and tigers to the mice for which cats hunt. Some of the large forms are said to develop a special partiality for human flesh; some of the smaller do not disdain to eat big insects. In attack the Felidæ often exhibit a wise discretion in seeking to avoid a fair fight with large animals.

Many members of the family have exceedingly beautiful fur, soft and glossy in texture, generally striped and spotted according to the varied pigmentation of the hairs. The markings in some may be regarded as protective; thus, the stripes of the tiger 'assimilate,' according to Wallace, 'with the vertical stems of the bamboo,' and the spots of the leopard are suited to the interrupted light of the jungle. It seems also true, as Eimer has emphasised, that the markings illustrate definite rhythms of development, and exhibit an orderly progression both in the individual and in a series of related forms. They are in fact, here as elsewhere, external indices to constitutional changes. The colour-differences between the sexes are seldom marked, though they are distinct in the Ocelot (*Felis pardalis*) and a few other forms. The male lion, stronger and larger than the female, is distinguished by his mane, which appears to have protective as well as decorative value. The male Canadian Lynx (*F. canadensis*) also excels his mate in the development of a ruff round the neck. The Felidæ are very cleanly, taking pains to keep their fur in order, and are free from unpleasant smells. They have, however, a notorious dislike to water.

As one would expect from their habits, the senses of Felidæ are highly developed. Keen scent; quick sight, especially for near objects, and well suited for night-work; acute hearing, and great power of localising sounds; and a delicate tactile sensibility in the strong hairs of the moustache or whiskers, are characteristic. The eyes are large, and possess marked powers of accommodation to different quantities of light; the pupillary opening is rapidly altered, contracting in bright light to a narrow slit, though in some forms into the usual circular shape. The animals generally hunt at night, and then their eyes seem to 'burn brightly.' The ears are of moderate size, usually pointed, and mobile.

The intelligence of the family is certainly highly developed, and many of the members can be readily tamed when young, though a deeply ingrained wildness keeps the domesticated cat or tamed individuals of other species from exhibiting the

marvellous educational results familiar in dogs. They are not social animals, never hunting in troops, and even the males and females usually live apart except at the breeding season. In spite of the individualism and ferocity of the Felidae, maternal care and affection are exhibited in a high degree. Not only will a lioness robbed of her cubs risk her life to rescue them, but the habitual care is tender and lavish.

The wild Felidae seem to be less prolific than the Canidae, two or three at a birth being an average number. There are usually eight teats, lying on the breast and the abdomen.

While the above are the chief characteristics of Felidae, it is necessary also to notice that the family is separated from the adjacent civets (Viverridae) and hyenas (Hyaenidae) by technical details such as the reduction of molars to one above and one below in each jaw, the presence of only two inferior premolars, the division of the bony auditory prominence or tympanic bulla into two chambers, the number (thirteen) of dorsal vertebrae, and so on.

The Felidae are almost world-wide in distribution, absent only from the Australian region, Madagascar, and the Antilles. They are especially abundant in warmer climates. In the Old World, Lion (*Felis leo*), Tiger (*F. tigris*), Leopard or Panther (*F. pardus*), Ounce (*F. uncia*), Wild Cat (*F. catus*) are well-known species; while in the New World may be noted the Puma (*F. concolor*), the Jaguar (*F. onca*), and the Ocelot (*F. pardalis*). The Lynx (*F. lynx*) is probably common to both hemispheres. The Cheetah or Hunting Leopard is sometimes placed in a separate genus, *Cynalurm*.

Numerous Felidae occur in Tertiary strata, many quite like species now alive, others with more numerous and less carnivorous teeth, others again (e.g. *Smilodon*, *Machærodus*, and especially *Eusmilus*) with much greater development of upper canines than in modern forms. Through extinct American genera like *Nimravus*, Professor Cope traces back the modern Felidae to a race of primitive unspecialised cats. So far as natural selection means the destructive elimination of one animal by another, the Felidae must rank high as agents in the process, and it is at least certain that their abundant presence must exert an often wholesome restraining influence on many more prolific animals. See CARNIVORA, CAT, CHEETAH, JAGUAR, LEOPARD, LION, LYNX, OCELOT, OUNCE, PUMA, TIGER, &c.

**Felix**, ANTONIUS, or CLAUDIUS, a Roman procurator of Judæa in the time of the apostle Paul, was a freedman of the Emperor Claudius I. and was brother of his favourite Pallas. The circumstances under which he received his appointment are related differently by Tacitus and Josephus. The latter tells us that he cleared the country of robbers, and vigorously suppressed the chaotic seditions of the Jews; but his cruelty, lust, and greed were unbounded. His wife was Drusilla, a beautiful but renegade Jewess, whom he had induced to abandon her first husband. According to Tacitus, she was a granddaughter of Antony and Cleopatra. We read in Acts (xxiv. 25) that Felix trembled as Paul reasoned of 'righteousness, temperance, and judgment to come.' He was recalled to Rome, 62 A.D., on account of the accusations preferred against him by the influential Jews of Cæsarea, and narrowly escaped the sentence of death.

**Felix I.-IV.**, POPES. FELIX I. succeeded Dionysius in the see of Rome in 269. Little is known of his history, for though he has been put amongst the martyrs there is no early evidence as to the manner of his death. Felix II. was the first

antipope (see ANTIPOPE), being consecrated when Liberius was banished (356) for refusing to condemn Athanasius. When Liberius was restored in the following year, Felix was constrained to retire from the city. Most ancient authorities treat him as an unauthorised interloper; but he was ultimately regarded as a saint and martyr (on what evidence does not appear).—FELIX III. ascended the pontifical throne in 483 as the successor of Simplicius. He was a native of Rome, and of the family from which afterwards sprang Pope Gregory the Great. Immediately after his accession Felix repudiated the Henoticon or Decree of Union between the Eastern Church and the Monophysites proclaimed by the Emperor Zeno, and proceeded to excommunicate Acacius, patriarch of Constantinople, because he refused to do the same, thus originating the first disruption between the churches of the East and West, a breach which on this occasion lasted thirty-four years. Felix died 24th February 492, and was succeeded by Gelasius.—FELIX IV., a native of Benevento, succeeded John I. in 526. He was appointed by Theodoric, and failed to meet with the approval of the clergy and the people. He died in 530. His successor was Boniface II.—FELIX V. (antipope). See AMADEUS (VIII. of Savoy).

**Felix**, ST., with his sister and fellow-sufferer Regula, the patron saints of the city of Zurich and its cathedrals. Early in the 3d century he preached Christ there, and was beheaded on the site of the great cathedral. His day is the 11th September.

**Felixians**, a Spanish sect of the later part of the 8th century, so called from Felix, Bishop of Urgel. See ADOPTIANISM.

**Felixstowe**, a coast-village of Suffolk, with a railway station (1 mile off) 9½ miles S.E. of Ipswich. It is named from a priory (1105), dedicated to St Felix, a Burgundian, who from 631 to 647 was first bishop of Dunwich. With a fine beach for bathing, a pier, good golf-links, and many Roman remains near by, the place is rapidly becoming a popular seaside resort. Pop. 864; with it is now joined Walton, 1 mile to the west (pop. 1272).

**Fell** (Norw. *fjell*, Swed. *fall*), the name given in Scandinavia to the bare plateaus which occur in its mountainous regions; they are destitute of vegetation, and generally lie above the snow-line. The word enters as a component into the names of innumerable mountains, owing to the fact that in their formation they have taken on the shape of a fell. Fell is also used in the north of England and south of Scotland to designate a barren hill, and indicates Scandinavian settlements.

**Fell**, JOHN, Dean of Christ Church and Bishop of Oxford, was born most probably in 1625, his father, Dr Samuel Fell, being also Dean of Christ Church, of which the boy became a student at the age of eleven. He volunteered for the king, and with Wallis and two others contrived to maintain Church of England services during the Commonwealth; at the Restoration he was rewarded by being made Canon and four months later Dean of Christ Church, royal chaplain, and D.D. He governed the college strictly, restored its buildings, reformed its discipline, and himself attended divine service four times a day. He was liberal of his money to public purposes and the necessities of poor scholars, and did much to promote learning and the advancement of knowledge. In 1676 he became Bishop of Oxford, without, however, giving up his deanery. He rebuilt the episcopal palace at Cuddesdon, and died in 1686. His works no longer concern the world, but his name lives in the well-known proverb: 'I do not like thee, Doctor Fell, the reason why I cannot tell,' usually said to be a paraphrase made by Tom Brown,

when a student at Christ Church, from Martial's 'Non amo te, Sabidi,' but more likely to be rather his paraphrase of the following version of Martial in Thomas Forde's *Virtus Rediviva* (1661): 'I love thee not, Nel! but why, I can't tell.'

**Felláh** (pl. FELLÁHÍN), an Arabic word meaning 'tiller' of the soil, specially applied to the agricultural or labouring population of Egypt by the Turks, in a contemptuous sense, as 'yokels,' or 'boors.' They form the great bulk of the population, and are descendants of the ancient Egyptians, intermingled with Syrians, Arabs, and other races which have been converted to Islam. In their physical conformation and features they differ among themselves, those of the northern provinces of the Mediterranean being of whiter hue, while at Assouán they are almost black. They are described as of middle stature, with large skull, facial angle almost 90 degrees, oval face, arched eyebrows, deep dark eyes, large, well-formed mouth, with rather thick lips, thin beard, short nose, large chest, small belly, arched back, and small hands and feet. Their dress generally consists of a blue or brown cotton smock and linen drawers. On their shaven head they wear the *turbish*, or only a thin cotton cap, but the better-off wind a poor turban round it. The women are singularly graceful and slender, with beautiful skin (despite their tattooing) and often lovely features, and especially magnificent eyes; their dress is a single cotton smock, which they pull up over their mouth before men, and few wear the regular face-veil. They are often married at eleven years, become mothers at twelve, and grandmothers at twenty-four. The children are pot-bellied, dirty, and fly-bitten, but grow up straight, strong, and healthy. Their villages are mere groups of mud-houels. The food of the Felláhn consists almost entirely of vegetables, chiefly millet bread and beans, which they eat in a crude state. Even rice is too dear for them, and animal food seldom attainable. Their drink is limited to the water of the Nile and coffee, and the only luxury which they enjoy is the green tobacco of the country; yet on this diet they are robust and healthy, and capable of extraordinary labour and endurance. In their social position they are inferior to the Bedouin, who, although they will marry the daughters of the Felláhn, will not give to them their own in marriage. They exhibit the moral qualities of the ancient Egyptians—are intelligent, docile, pliable, cheerful, and sober on the one hand, and quarrelsome, satirical, licentious, and of unbending obstinacy on the other; and they inherit the traditional hatred of their ancestors to the payment of taxes, which were formerly too often extorted by the bastinado. Their condition under British direction has improved, but is still far from satisfactory. Each village is governed by a Shevkh-el-Beled, who is responsible to the Náziis and Mamúrs, or district officials, for the conduct of the inhabitants and their due payment of taxes; and the government of these several officers is frequently characterised by injustice, speculation, and extortion. The political rights recently accorded to the Felláhn are apparently but little understood or exercised. See Lane, *Manners and Customs of Modern Egyptians*; Clot Bey, *Aperçu générale*; Lane-Poole, *Egypt*.

**Fellows**, SIR CHARLES, English archæologist, was born at Nottingham in 1790. Devoting himself to the work of exploration in the western peninsula of Asia Minor, and along the course of the ancient Xanthus, he discovered (1838) the ruins of the city of Xanthus, formerly the capital of Lycia, and those of the ancient Tlos. Having made drawings of some of the fine remains of architecture and sculpture which he found in these

cities, and copies of some of the inscriptions, Fellows returned to England, and published *A Journal written during an Excursion in Asia Minor* (1839). In the course of another visit to Lycia in 1839 he discovered the ruins of no less than thirteen cities, each of which contained works of art, and which he described in *An Account of Discoveries in Lycia* (1841). Under the auspices of the British Museum, Fellows went out to Lycia twice, in 1841-44, for the purpose of selecting works of art, and marbles and casts, from the cities he had discovered. Knighted in 1845, he died at Nottingham, 8th November 1860. Besides his *Journals*, he wrote *The Xanthian Marbles* (1843), *An Account of the Ionic Trophy Monument excavated at Xanthus* (1848), and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Lycian Monuments in the British Museum* (1855).

**Fellowship**, in a college, is a foundation which usually entitles the holder to be a member of the college, to share in its revenues and government, and, in Oxford and Cambridge, to have rooms in college, with other privileges. Celibacy was usually insisted on in old days, and life fellowships were usual. Commonly now fellowships are for a term of years, or while the fellow continues to perform specified work. In some universities, such as those of Scotland, the fellowship is a university prize for one or more years, bestowed after examination on graduates. See UNIVERSITY, OXFORD, CAMBRIDGE.

**Felo de se.** See SUICIDE.

**Felon and Felony.** The Old Fr. *felon* was derived from a Low Lat. *felo*, *fello*, 'a traitor,' a word probably of Celtic origin (cf. Gaelic *feallan*, 'a traitor'), but ultimately cognate with Lat. *fallere* and Eng. *fail*. Its original signification was supposed to be a vassal who failed in his fidelity or allegiance to his superior, thus committing an offence by which he forfeited his fee or fief. From this it came to signify traitorous or rebellious, and was gradually generalised till it reached its modern meaning. In English text-books felony is usually defined as a crime which works a forfeiture of land or goods. Treason itself, says Coke, was comprised under the name of felony, and all capital offences; also such offences as suicide, manslaughter, and larceny, 'as they submit the committers of them to forfeitures.' At the present day it is not possible to draw any logical and consistent distinction between those crimes which are called felonies and those which are called misdemeanours. Sir J. F. Stephen, in his *History of the Criminal Law*, has pointed out that the distinction is obsolete; and, if parliament should ever find time to recast the criminal law in general principles, the term will probably disappear. The general principles of American law are the same as those of English law. In Scotch law the term felony has not now any special significance. See COMPOUNDING OF FELONY, and FORFEITURE.

**Felsite**, a fine-grained, compact, or cryptocrystalline rock composed essentially of 'felsite matter,' which appears to be an intimate admixture of orthoclase and quartz. This rock is now recognised as only a variety of quartz-porphyr.

**Felspar** (Ger. *Feldspath*, 'field-spar'), a general term in mineralogy for the most important rock-forming group of minerals. The felspars are usually divided into two series—in one of which the minerals crystallise in monoclinic forms, and in the other in triclinic forms. They are all anhydrous silicates of alumina, containing either potash, soda, or lime alone, or two of those bases together. Thus they are often spoken of as potash-, soda-, lime-, soda-lime-felspars, &c. They have a hardness

between 6 and 7—that is to say, they can just be scratched with a good penknife. Their specific gravity is about 2.6. The most important feldspars are shown in the following table:

|                                                    | Silica percentage |
|----------------------------------------------------|-------------------|
| MONOCLINIC.... Orthoclase (potash-feldspar) ....   | 64.03             |
| Microcline (potash-feldspar) .....                 | 61.03             |
| Albite (soda-feldspar) .....                       | 68.62             |
| TRICLINIC .. Oligoclase (soda-lime-feldspar) ..... | 61.0-63           |
| Andesine (soda-lime-feldspar) ....                 | 55.4-61.0         |
| Labradorite (lime-soda-feldspar) ..                | 61.0              |
| Anorthite (lime-feldspar) .....                    | 43                |

*Orthoclase* (Gr. *orthos*, 'straight,' *klasis*, 'a fracture') is so called because the two cleavage-planes of the mineral are at right angles to each other. As a rock-former, it occurs most frequently in the form of imperfect crystals or irregular crystalline aggregates. In porphyritic rocks, and especially in drusy cavities in such rocks as granite, it often appears in tolerably well-developed crystals. It is an essential constituent of granite, syenite, orthoclase-porphry, and quartz-porphry. The compact ground-mass of the two last-mentioned rocks is largely composed of micro-crypto-crystalline orthoclase. Orthoclase occurs also as an accessory ingredient in most plagioclase rocks, and is present in many of the crystalline schists, especially the gneissose rocks. A clear glassy variety of orthoclase called *sanidine* is a common constituent of many igneous rocks of Tertiary and Recent date, such as liparite, phonolite, trachyte, &c. Orthoclase, as a rule, is readily acted upon by the weather—the potash and some of the silica being removed in solution, while a fine-grained clay or kaolin is left behind. Ordinary orthoclase is either gray, white, or flesh-coloured, and these tints of the feldspar generally determine the colour of the rock in which it occurs. Thus we have *gray* granites and *red* or *pink* granites.

*Microcline* has the same composition as orthoclase, and its cleavage-angles differ so very slightly from a right angle that it might well be looked upon as simply another form of orthoclase. It is frequently associated with the latter in plutonic and schistose rocks.

The other triclinal feldspars are grouped together as *Plagioclase* (Gr. *plagios*, 'oblique,' and *klasis*, 'a fracture;') in reference to the cleavage-planes, which are not at right angles to each other, and are among the most important rock-formers. According to Tschermak, they form a series of which anorthite and albite are the extremes, while the others are isomorphous mixtures of these two types in various proportions. The plagioclase feldspars often assume a tabular aspect when growth has taken place in the direction of the lateral axis. At other times the crystals, owing to extension in the direction of the principal axis, acquire a long prismatic form. As rock-formers they occur either as well-developed crystals, or as irregular crystalline granules, or sometimes as a crypto-crystalline matrix or ground-mass, through which other rock-forming minerals are disseminated. On fresh unweathered faces of an igneous rock the crystals frequently appear as clear glassy strips or rods, in which may often be detected by the eye or by a lens a fine parallel striation, formed by the union of many twins, sometimes thirty or more appearing in one and the same crystal. This structure is never seen in orthoclase. This repeated twin-lamellation has been developed artificially in untwinned plagioclase by subjecting the mineral to a high temperature, and the same molecular change has been superinduced by pressure. Plagioclase is an essential constituent of many igneous rocks, and it is likewise met with in many crystalline schists, in which it is the product of hypogene metamorphic action. *Albite* is a common constituent of some crystalline schistose

rocks and certain crystalline limestones. As a secondary product it is occasionally met with also in igneous rocks. *Oligoclase* occurs both in the older and younger eruptive rocks—in hypogene rocks and in fine volcanic rocks. *Andesine* is met with rarely in crystalline schists, but is a common constituent of some eruptive rocks, such as andesite. *Labradorite* is an essential constituent of such rocks as gabbro, basalt, &c. It occurs also in metamorphic rocks, sometimes in large crystalline masses. It often shows fine chatoyant reflections, receives a fine polish, and is occasionally employed in jewelry. *Anorthite* is not common as a rock-former. It occurs in some basalts and andesites, and sparingly in a few crystalline schistose and granitic rocks.

The feldspars which occur in rocks that contain much free silica (quartz) are generally orthoclase and microcline, but with these are frequently associated the highly silicated feldspars, albite and oligoclase. The chief habitat of the basic plagioclase feldspars are basic igneous rocks.

Common feldspar or orthoclase, under the name of *Petunse* or *Petuntze*, is employed by the Chinese (along with some of the quartz associated with it) in the manufacture of porcelain. It is used with other materials as a flux, and alone to form an enamel or glassy covering, without which the porcelain would absorb moisture and grease. *Kaolin* (Chinese) is the name given to the fine clay which results from the decomposition of feldspar, as in the case of the highly weathered granites of Cornwall. *Adularia* is a transparent variety of orthoclase, often showing pearly opalescent reflection, and sometimes a play of colours. The finest specimens of this variety are cut as ornamental stones, and known as *moonstones* (some moonstones, however, appear to belong to albite and oligoclase); another kind, found among rolled stones in Ceylon, and remarkable for the reflection of a pearly light, has occasionally been confounded with Cat's-eye (q.v.). *Sunstone*, or *aventurine feldspar*, is somewhat similar to the variety of quartz called *Aventurine* in the play of light which it exhibits—a property which seems to be due to disseminated crystals or plates of hematite or goethite. *Aventurine feldspar* is not always orthoclase, some of it belonging to albite and oligoclase. *Amazon-stone* is a bright verdigris-green orthoclase, fine specimens of which come from Pike's Peak, Colorado. *Peristerite* is a whitish adularia-like albite. *Saccharite* is a granular massive variety of andesine.

**Felstone**, a rock-term now disused. It comprised a number of rocks composed chiefly of feldspar, sometimes orthoclase, and sometimes plagioclase. These rocks are now referred to quartz-porphry and porphyrite.

**Felt**, a fabric formed without weaving, by taking advantage of the natural tendency of the fibres of wool and certain kinds of hair to interlace with and cling to each other.

The property of felting or matting which the fibres of wool and hair of various animals have arises from their structure. When one of these fibres is examined by the microscope, it is found to be minutely notched or jagged, the barbs pointing to the tip of the hair. This serrated edge, and also a tendency to curl, cause these animal fibres to interlock, and so felt or mat when they are intimately mixed and rubbed in a moist state upon each other. Some fibres of this kind, however, such as human hair and horse-hair, are too nearly smooth or too rigid for felting purposes. Among the materials most suitable for felting are the wool, fur, and hair of such animals as the sheep, goat, ox, hare, rabbit, musquash, and beaver. Some of these are used chiefly for felt

hats (see HAT). Felted cloth is made principally from wool, but less valuable substances are mixed with it.

The making of felted fabrics is a very ancient art in some parts of Asia, and to this day the thick *nimuds* or *nammads* of Persia and Turkestan are remarkable not only for their durability, but for their beautiful ornamentation, produced by a felted inlay of coloured wools. It is said that thick felts made up into boots and gaiters form the only foot-covering capable of resisting the cold of a Siberian winter.

The first successful mechanical process for the manufacture of felt was invented by Mr J. R. Williams, an American, in the decade 1820-30, Mr Wells, also an American, being associated with him. Williams took out a patent for the process, or for a modification of it, in England in 1840, and about this time a large factory was erected by some capitalists at Leeds to manufacture felt cloth under the patent. The company speedily attained great prosperity, but in the full tide of its success the mill was destroyed by fire. Williams, whose whole property was in the concern, which was not insured, soon afterwards died of grief.

By the above process, not materially modified, felt cloth is still made. The wool is first formed into a thin lap or sheet on a carding-engine (see WOOLLEN MANUFACTURE). A number of these laps are piled upon each other till a sufficient thickness is obtained. At this stage the future piece of felt cloth is in a loose, open condition, sometimes called a fleece. It is then submitted to pressure in a machine with an upper and a lower series of rollers, between which it passes. Some of these are solid, and some are hollow and contain steam. It is by the rubbing action of these rollers, the upper series of which oscillate, that the fleece, under the influence of steam and moisture, becomes converted into a compact cloth. Fabrics so made are entirely held together by the interlocking of the fibres of wool.

There are other kinds of machines for making felted cloth. In one of these a heavy oscillating table is employed instead of rollers, by which several fleeces are felted at one time. Another, designed by a German engineer, is so constructed that the preparatory operations of opening and carding the wool, as well as the damping, pressing, and rubbing of the lap or fleece, are made continuous—i.e. all are done on one machine. In this case, rollers arranged in a vertical frame are used for consolidating the fleece into felt.

Such felt goods as druggets, carpets, and table-covers are usually printed with patterns in colours. The manufacture of felt for various purposes is extensively carried on in England, on the continent of Europe, and in the United States. Among the kinds made, besides those for furniture and dress purposes, are felts for polishing glass and marble, for saddle-cloths, for lining india-rubber fabrics, for parts of shoes, gun-wads, and hammers for piano-keys. Mixed or coated with asphalt, pitch, or tar, a coarse felt is used for covering roofs, vessels, and iron buildings. For these same purposes it is also combined with Asbestos (q.v.), this mixed kind of felt being likewise used for covering steam-boilers and pipes. The 'blankets' used on paper-making machines, though not strictly felts, are woven fabrics highly felted.

**Felton**, CORNELIUS CONWAY, president of Harvard College, was born in West Newbury, Massachusetts, in 1807, and studied at Harvard, where, after filling several minor posts, he became in 1834 Eliot professor of Greek, and in 1860 president. He died 26th February 1862. He published translations of modern European works, and editions of Greek classics; his chief work, however, was his

posthumous *Greece, Ancient and Modern* (2 vols. Boston, 1867), mostly made up of lectures delivered before the Lowell Institute.

**Felton**, JOHN (c. 1593-1628), the assassin of the Duke of Buckingham (q.v.).

**Feltre** (ancient *Feltria*), a town of Northern Italy, near the Piave, 19 miles SW. of Belluno by rail. Pop. 3715.

**Felucca**, a class of small merchant-vessels used in the Mediterranean. They have two masts, carrying lateen sails, and frequently have a rudder at each end, to be applied as occasion demands. Formerly feluccas were also employed in war and piracy.

**Feme Coverte** (*fumina viro co-operta*), in the law of England, a married woman. See HUSBAND AND WIFE. *Feme sole* is an unmarried woman.

**Femern**, an island (area, 71 sq. m.) in the Prussian province of Sleswick-Holstein, flat, fertile, and well cultivated, but with a harsh climate. Agriculture, fishing, and stocking-weaving form the principal employments of the inhabitants (9800).

**Femgerichte**. See **VEHMGERICHTE**.

**Femoral Artery**, the chief artery of the thigh. See **ARTERIES**.

**Fences**, in Agriculture, serve in general the threefold purpose of inclosing animals on pasture-grounds, of protecting land from straying animals, and of affording shelter from cold winds. In countries where wood or stones are scarce, and more especially where the land has been long settled, hedges formed of various kinds of plants are common. These, when grown upon good soil, and when well kept and managed, give a clothed and picturesque appearance to the landscape. The hawthorn or white-thorn is the favourite hedge-plant in Britain. See **HEDGES**.

Stone walls, when well constructed, form the best fences. The form and mode of building varies with the nature and quality of the stones. In Aberdeenshire the walls or dykes surrounding the fields are constructed of granite boulders that are found strewn over the surface of the country. The Silurian of the southern counties of Scotland supplies durable but irregularly shaped whinstone, which forms a lasting but rough fence.

In new countries, where wood is abundant, the fences are all of this material. The snake-fence, named from its zigzag form, is made by merely laying trees above each other, in such a manner that their ends overlap and cross, and require no additional fixing. As wood becomes more valuable, it is made into posts and rails. The posts are driven into the ground from two to three yards apart, and from four to five rails are nailed across, according to the purpose it is meant to serve. The etob and rafter fence is made by driving the posts in the ground at a distance of from three to four inches apart, and binding the whole by a rafter or rail nailed across the top. This is one of the strongest of wooden fences, but requires more material than the other. In America split rails, roughly sharpened at either end, and let into wide openings cut in the posts, are in common use.

Iron or wire fencing has come much into use of late. Vast stretches of waste land in Britain, as well as pastures in Australia, have been inclosed by means of wire-fencing. Strong wires are stretched on straining-posts firmly secured in the ground 200 yards apart. Intermediate or lighter posts—standards for support, or hangers in the hollows to keep down the wires, as the case may be—are put in at from two to three yards' distance. After the wires are fully stretched they are fixed to the smaller posts; when of wood, by means of staples, or threaded through, when of iron. Barbed

wire is now extensively used in fencing cattle, both in Britain and elsewhere. The only danger of serious injury from the use of barbed wire is when an animal runs close to and in the line of the fence; a horse can thus save the skin and flesh through, and lay the shoulder-joint open in a few seconds. The corrugated wire-fence is an elegant and inexpensive form, in which the standards are placed 1 rod apart, and the wires are kept in their position by being tied with cross wires at distances of 3 yards apart.

In Scotland the landlord is held bound to put the fences on the farm in duo repair on the entry of the tenant, independently of any stipulation in the lease; whilst both in England and Scotland the tenant must maintain the fences and leave them, with the exception of ordinary tear and wear, in the state in which they were given over to him. A tenant who erects a temporary fence (e.g. a wire-fence), can, unless he makes a special agreement to the contrary, remove the same as a temporary fitting, provided the ground on which it stood is left in the original natural condition.

**Fencible**, a word meaning defensive, and applied to regiments raised for local defence, or at—and only for—a special crisis. The word is still retained in the title of the Royal Malta Fencible Artillery.

**Fencing** may be generally described as the scientific handling of a sword or bayonet in attack or defence, though the term is usually limited to the use of the rapier. It is taught in every gymnasium, and in the British army every officer on joining is put through a course of gymnastics of which it forms a part. Non-commissioned officers are taught at the Aldershot Gymnasium, and then appointed instructors in the various garrisons where gymnasiums exist, and to all cavalry regiments, the troops of which are also trained by them.

FENCING WITH THE RAPIER OR FOIL is admitted to be the best exercise that can be taken. Every muscle of the body is brought into play by it, and hand and eye are trained to act in unison. No description can pretend to teach it. Even an instructor who is not thoroughly capable does more harm than good in attempting to teach fencing, as bad habits are acquired which it is most difficult to unlearn; and, unless every movement is accurately and properly made, there is no science and very little interest in its practice.

The foil in practice used as a substitute for the rapier should have a tapering blade about 32 inches long, and square in section, with a gutta-percha button on the point, and a weighted pommel to the hilt, so as to balance it properly. Masks of wire netting are absolutely essential to protect the face, and leather gloves, jackets, and aprons should also be worn.

Except in Spain, where one straight cut at the head is allowed, the only attack with the rapier or foil is by *thrust* and *lunge* (or *lunge*)—i.e. straightening the elbow so as to bring the sword and arm into line, and then sliding forward about 18 inches with the right foot. The defence is by slight movements of the sword hand, which cause the *faible* (upper half) of the assailant's blade to glide along the *forte* (lower half) of the defender's foil, and outside it, so as to pass clear of his body, while his point is always kept towards the front, ready to *ripost* (lunge after parrying) without an instant's delay. The proper positions and movements when on guard, engaged, *longeing*, *parrying*, *advancing*, and *retreating* must be most carefully learned from an instructor, and assiduously practised, as well as the various attacks. A reproduction (fig. 1) of the diagram given by Captain Chapman in his excellent little book, *Foil*

*Practice*, shows the four lines of attack and the nine parries usually taught. It will be sufficient to mention that a *counter parry* describes a circle

Fig. 1.

under or over the adversary's foil before throwing it off, and to add the following explanation of terms used in fencing. When the nails are uppermost the sword hand is said to be in *supination*, when under, in *pronation*. The thrusts, like the parries are called *quarte* (or *carle*), *tierce*, &c. The *fenceonade* is an attack made by the assailant *binding* his blade round the adversary's and *longeing* at his body under his arm. An attack may be a combination of any of the following movements preceding a *longe*: *disengage*, when swords are crossed, changing from one line of attack to another by passing under the adversary's sword; *cut over*, the same change by whipping over his sword; *one, two*, a double disengagement; *double*, both blades horizontal, and circling round parallel to one another; and *beat*, a side-blow of one blade on the other. If a second thrust is made after *longeing*, and without springing up to guard again, it is called a *reprise*; and, if made to take advantage of a wide parry not followed by a *ripost*, a *remise*. *Time thrusts*, like cross-counters in boxing, parry a thrust by a thrust.

The system of fencing compiled by Mr Archibald Maclaren, of the Oxford Gymnasium, is that used in the British army, and differs from others in teaching only four parries—viz. *quarte*, *tierce*, *seconde*, and *semicircle*. All are formed in the usual manner, except the last, which, by raising the hand slightly and elevating the blade as high as the face, guards both the upper and lower openings on the inner or left side, carrying the adversary's blade over the right shoulder, and leaving him completely exposed to the return thrust. In Spain and Italy the left hand is used as an auxiliary in parrying, and in Italy is aided by a dagger, or a cloak.

THE BROAD-SWORD EXERCISE differs from fencing with the foil, in that the weapon employed is intended to cut as well as thrust. For practice a stout, straight stick is used, called a 'single-stick,' having a buffalo-hide or basket handle to protect the knuckles.

The position and movements of the combatant are very similar to those for fencing with the foil.

There are seven cuts, with seven corresponding guards, and three thrusts, as shown on the accompanying diagram, which represents a target placed opposite a pupil, with its centre in a line with the centre of his breast.

Fig. 2.

The cuts cross the whole circle through the centre along the *thick* lines. Nos. 1, 3, and 5 are inside cuts, and may be directed against any part of the left side, and inside of the right leg; 2, 4, and 6 are outside cuts, attacking the right side, and right leg on the outside. No. 7 is a vertical cut, aimed at the head. The dotted lines show the several guards. The points or thrusts are shown by the black dots. The 'parry' consists in bringing the wrist nearly to the right shoulder; whence, as centre, a circular sweep of the sword is made from left to right.

CAVALRY SWORD EXERCISE differs from the foregoing, which is not suitable for horsemen. It has four cuts on each side, two at a mounted, and two at a dismounted adversary. Each cut has a corresponding point and guard.

THE BAYONET EXERCISE taught in the British army has been assimilated to Maclaren's system of fencing. The guards are formed in as nearly as possible the same manner, except that, of course, the rifle is held in both hands, one at the grip, and one in front of the back-sight. The latter remains almost stationary, while the movements of the other form the parries. A new and most effective thrust, called the *throw*, has been introduced. When making it, the forward hand quits the rifle, which is thrown forward to the full extent of the other arm.

As to the relative values of the sword, rapier, and bayonet, the first, requiring for each cut two motions, one up and the other down, cannot but be much slower in its action than either of the other two; while the last, from its weight, is exhausting and clumsy. The second, on the other hand, has none of these objections, and in skilled hands is by far the most deadly weapon.

See Captain Chapman's *Foil Practice*; Maclaren's *System of Fencing* (1864); Captain A. Hutton's *Cold Steel* (1889); the *Manuals of Sword and Bayonet Exercise* published by the War Office; and *Fencing, Boxing, and Wrestling* in the 'Badminton' series, by Grove, Pollock, Armstrong, and Prevost (1889).

**Fen Country.** See BEDFORD LEVEL.

**Fénelon**, FRANÇOIS DE SALIGNAC DE LA MOTHE, was born August 6, 1651, in the château de Fénelon, province of Périgord, now included in the department of the Dordogne, of a family which has given many celebrities both to the church and to the state in France. His education was conducted at home up to his twelfth year, when he

was transferred to Cahors, and afterwards to the Plessis College in Paris. In his twentieth year he entered the newly-founded seminary of St Sulpice, where he received holy orders in 1675. Unlike too many ecclesiastics of his own rank at that period, he gave his whole heart to his sacred calling, being for some time employed in the parochial duties of the parish of St Sulpice; and in the year 1678 he was named director of an institution recently founded in Paris for the reception of female converts to the Roman Catholic faith. During his tenure of this office he wrote his first work, *De l'Education des Filles*; and the success with which he discharged his duties towards the young converts led to his appointment as head of a mission, which, on the revocation of the Edict of Nantes in 1685, was sent to preach among the Protestant population of Saintonge and Poitou. In 1689 he was named by Louis XIV. to the highly confidential post of preceptor of his grandson, the young Duke of Burgundy. In the discharge of this delicate trust he sought to impress on his pupil's mind the great principles of truth and justice upon which the prince's responsibilities are founded, and to show the hollowness and futility of all earthly glory, power, and happiness which do not rest upon this foundation. To this wise design of the preceptor we are indebted for many works still popular in educational use; for the *Fables*, for the *Dialogues of the Dead*, for the *History of the Ancient Philosophers*, and for the germ at least of the *Telemachus*. As an acknowledgment of these great merits, he was presented by the king in 1694 to the abbey of St Valery, and in the following year to the archbishopric of Cambrai.

It is to this period of Fénelon's life that the history of the unhappy controversy about Quietism (q.v.) belongs. Two separate schools of Quietism are to be distinguished. In one of these the common mystic principle of the absorption of the soul in the love and contemplation of God led to the conclusion that the soul, in this state of absorption, suffered no contamination from the material actions of the outer man, and that no acts of virtue, not even of prayer, were any longer required (see MOLINOS). The other school, while it maintained the theory of passive contemplation and love, yet repudiated the dangerous and immoral consequences which were deduced therefrom. It was exclusively the latter and less objectionable form of Quietism the professors of which for a time claimed, although not the patronage, yet at least the indulgent consideration of Fénelon. He formed in the year 1687 the acquaintance of the celebrated Madame Guyon (q.v.). Fully convinced of the unfairness of much of the outcry which was raised against her, and which made her responsible for all the principles of the grosser Quietism of Molinos, his generous mind was perhaps attracted to her cause by the very injustice of her opponents. He advised her to submit her works to the judgment of Bossuet, who was then in the zenith of his fame, and with whom Fénelon was in the most friendly relations. In the condemnation of the book of Madame Guyon by this prelate Fénelon acquiesced; but, as she made a formal submission to the church, he refused to join in any condemnation of herself personally. Nevertheless, when a commission was appointed to examine the whole affair, he signed their report. It was not thought enough to publish a condemnation of her several works, but Bossuet prepared a special exposition of the true doctrine of the church on these questions. To this work Fénelon refused to give his approval, and even composed his own *Explication des Maximes des Saints sur la Vie intérieure* in explanation and defence of certain at least of Madame

Guyon's doctrines; he cheerfully agreeing to the stipulation of the Archbishop of Paris that the *Maximes* should be kept back from publication until the completion of the rival treatise of Bossuet, *Instruction sur les États d'Oraison*. An unfortunate violation of this engagement, committed without the knowledge, and in the absence of Fénelon, was the last of a long train of causes which led to the painful and unedifying rupture between these two great prelates. Fénelon's book was received with much clamour, that of Bossuet was universally approved; and in the controversy that ensued all the displeasure of the court, which Fénelon had provoked by covert strictures in his works of fiction, was brought to bear against him. He was ordered to submit his book to the judgment of an ecclesiastical tribunal, of which Bossuet was a member. He refused to accept Bossuet as judge; and in the end he appealed to the judgment of the holy see. Bossuet published a succession of pamphlets; several of the bishops who had espoused the side of Bossuet issued pastorals in the same sense; and Fénelon defended himself vigorously against them all.

The last blow against the ancient friendship of the great rivals was struck by Bossuet in his celebrated *Relation sur le Quietisme*. Fénelon was wounded to the heart; but his most masterly defence was written, printed, and published within little more than a fortnight from the appearance of Bossuet's *Relation*. From this point the controversy assumed a more personal and therefore a more acrimonious character; and it was maintained on both sides till the long-delayed decision of the pope brought it to a close, March 12, 1699, by a brief, in the usual form, condemning the *Maximes des Saints*, and marking with especial censure twenty-three propositions extracted from it. The conduct of Fénelon under this blow constitutes, in the eyes of his fellow-churchmen, one of his highest titles to glory. He not only accepted, without hesitation, the decision of Rome, but he took the very earliest occasion to publish from his own pulpit the brief of his condemnation. The jealousy with which the political principles of Fénelon were already regarded was heightened about this time into open hostility by the appearance of his *Télémaque* (see TELEMACHUS), printed from a copy surreptitiously obtained by his servant, which the king regarded as but a masked satire upon his own court. Louis's anger knew no bounds. Fénelon was strictly restrained within his diocese; and measures were taken to give the condemnation of his book every character of publicity. From this date Fénelon lived exclusively for his flock. He founded at Cambrai a seminary for his archdiocese, which he made his own especial charge. He was assiduous in preaching and in the discharge of the other duties of his office; and the fame of his benevolence, charity, and enlightened liberality is attested by the order issued by the Allies in the campaign of 1709 to spare the palace and the stores of the Archbishop of Cambrai. The only later controversy in which he appears is the revival of the Jansenistic dispute, in which Fénelon engaged earnestly on the side of orthodoxy. He died January 7, 1715, and was buried in his cathedral of Cambrai (q.v.).

The works of Fénelon are very voluminous, and embrace every variety of subjects— theology, philology, history, literature ancient and modern, and oratory, especially the eloquence of the pulpit. His correspondence is very extensive and most interesting. Of his mature discourses two only have reached us in a finished state. They are of the very highest order of sacred eloquence. His work on the temporal power of the mediæval popes presents that doctrine in its most amiable form;

and even his spiritual writings in general are not unfrequently read by Christians of all denominations.

See Bausset's edition of the Works (22 vols. 1821-24), his *Histoire de Fénelon* (1808; new ed. 1862), the *Correspondence* (1727-29), and Marten's edition of the Works (3 vols. Paris, 1874); German Lives by Hummel (1873) and Wunderlich (1873); the somewhat one-sided English Life, by Mrs H. L. Lear (1876); and *Fénelon à Cambrai*, by E. de Broglie (1884). It should be added that Douen, in *L'Intolérance de Fénelon* (Paris, 1872), has endeavoured to establish by documents that both in his management of the institute for the converts and in his measures in Poitou, Fénelon frankly accepted the policy of persecution, and was guilty of inexcusable severity and even cruelty. See an article in the *Quarterly Review* for 1885.

**Fenestella**, or FENESTRELLA, a genus of Polyzoa, resembling the recent 'lace coral,' very common in Palæozoic rocks, from the Lower Silurian to the Permian.

**Fenians**, a political association of Irish or Irish-Americans for the overthrow of the British authority in Ireland, and the establishment of a republic. The name is traced to the ancient Irish military organisation called Fionna Ehin, which took its appellation from the celebrated hero of Irish legend, Finn (or Fionn) MacCumlhail. This renowned body was designed as a national militia, and its origin has been ascribed to Sedna II., who reigned in Ireland about 400 B.C. In time of peace it consisted of three bodies, each formed on the model of a Roman legion, and consisting of 3000 men; but in war it was capable of being enlarged to any required limit. Candidates for enrolment were required to be of an honourable family, to be irreproachable in morals, and to bind themselves to observe the laws of justice and morality; they were required to be of a certain height, and strong, supple, and vigorous of body. The generally historical character of the institution is unquestionable; and it subsisted until the reign of Carbery, son of Cormac MacArt, by whom the body of Fionna Ehin was disbanded; and the members, having in consequence transferred their allegiance to Mucorb, king of Munster, suffered an almost total extermination in the battle of Gavra, 284 A.D. This formed the theme of many a bardic poem from the days of Oisín (known in Gaelic legend as Ossian), son of Finn MacCumlhail, downwards.

The modern Fenian movement adopting the name of this ancient military association had its first seat in America, where the Irish population had largely increased since the famine of 1846-47. Many of the emigrants being driven from their homes by arbitrary ejectment, or from inability to pay rent, carried with them a sense of wrong; others had been sympathisers if not participants in the insurrection of 1848; and almost all were deeply imbued with general political and social discontent. The most openly active seat of the organisation was in the western states, especially Chicago; but the movement was directed from New York, and possessed ramifications in almost every city of the Union. It was conducted by a senate, and consisted of 'circles,' each directed by a centre. The duty of the centres was to enrol members, who bound themselves, generally by oath, 'to be faithful to the Irish Republic as at present virtually established; to instruct and practise them in military exercises; to raise funds for the purposes of the association, especially for the purchase of arms and munitions of war; and to extend the organisation by every means at their disposal. Agents were sent into Ireland, and to the chief seats of the Irish population in England; and, opportunely, the termination of the civil war in America set free a large number of men with

military training and experience. In this, unlike almost all similar movements, pains had been taken to exclude the Catholic clergy, by whom the Fenian confederation had from the first been steadily resisted, from all knowledge of its character and objects, as well as of the names or number of its members in the several localities.

By degrees the movement acquired solidity, and the British government ascertained that Fenianism, however corrupt in some of its sources, and however wild and extravagant in its aims, was nevertheless a reality with which it had become necessary to grapple. The Habeas Corpus Act having been summarily suspended, all the known leaders in Dublin and in the provincial districts of Ireland (most of them Irish-Americans) were at once placed under arrest. The 'Head Centre,' James Stephens, was one of those arrested. The chief journal of the conspiracy, *The Irish People*, edited by O'Donovan Rossa, was suppressed and seized; additional troops were moved into Ireland, and other measures of repression were vigorously carried out. Many of the prisoners, convicted of treason, were sentenced to penal servitude. By these energetic measures public tranquillity was maintained in Ireland, but the embers of discontent continued to smoulder among the poorer peasantry and the working population of the towns; and a certain prestige was given to the fallen cause by Stephens' escape from prison. His return and that of other exiles to America renewed the agitation in that country. In the early summer of 1866 a raid was attempted into Canada, which proved an utter failure; and it was followed in the spring of 1867 by an utterly abortive attempt at insurrection at home, beginning with the seizure of the castle and military stores at Chester. The attempt was defeated by the treachery of one of the conspirators. A partial insurrection, however, took place in the county of Kerry; and a few weeks later a more extensive movement was attempted in the counties of Dublin, Louth, Tipperary, Limerick, and Cork. But most of the parties dispersed or were made prisoners after a single night's campaign. The rest betook themselves to the mountains, and after a few days of exposure and hardship were either captured or dispersed. The leaders were tried at a special commission held in the spring of the year 1867, some being convicted, but none executed; and tranquillity for a time seemed to be restored in Ireland. In September 1867 an attack was made, in open day, on a police-van in Manchester; the officer in charge was killed, and the prisoners, who were suspected Fenians, were released. A few weeks later a still more daring attempt was made to blow down Clerkenwell Prison wall, with the same object.

In 1871 the United States government frustrated another Fenian raid on Canada by the apprehension of its leaders and the seizure of its arms. Later developments of the Fenian spirit appeared (1883-85) in the *Skirmishing Fund*, raised to promote the free use of dynamite for the destruction of English public buildings and English commerce, and in the extreme party of the *Clan-na-Gael*; and some of the 'invincibles' who were to 'make history' by removing tyrants, as in the Phoenix Park assassination (1882), had been Fenians. Some also of those who were leaders in the Home Rule and Land League agitations had formerly been members of the Irish Republican Brotherhood.

See the section on the history of IRELAND in this work; and J. Rutherford's *Secret History of the Fenian Conspiracy* (2 vols. 1877).

**Fennec** (*Canis cerdo*, *feneticus*, *chama*), little African foxes, of elegant habit and active, courageous disposition. The ears are remarkably large. Fennecs are found apparently throughout Africa,

and are sometimes hunted. In diet they show an interesting though not unique fondness for sweet vegetable food, such as dates. Quite distinct is the decidedly larger African Fox (*Otocyon megalotis*). See FOX.

**Fennel** (*Feniculum*), a genus of umbelliferous plants, allied to Dill (q.v.), but distinguished by the cylindrical, strongly-ribbed fruit. The flowers are yellow. All the species are aromatic, and have much-divided leaves with thread-like segments. The best known is the Common Fennel (*F. vulgare*), a native of the south of Europe and of some parts of England. It is a biennial, 3 or 4 feet high, and is cultivated in gardens, chiefly for the sake of its leaves, which are boiled, and served up with mackerel, with salmon, and occasionally with other kinds of fish, or are employed to form a sauce for them.—Sweet Fennel, Italian Fennel, or Cretan Fennel (*F. dulce*), is a plant of much humbler growth, an annual, much cultivated in the south of Europe, but too tender for the climate of Britain. The young sprouts from the root are sweeter and less aromatic than those of Common Fennel, and when blanched form a very agreeable salad and potherb. The fruit (seed) is longer and paler than that of Common Fennel, has a more agreeable odour and flavour, is a favourite aromatic condiment of the Italians, and is used in medicine as a carminative and aromatic stimulant. Oil of Fennel, an aromatic, stimulant, and carminative essential oil, is also made from it.—Cape Fennel (*F. capense*), found in the interior of the Cape of Good Hope, has a thick, aromatic, esculent root.—The Pannuloooree of India (*F. pannulorum*) is a species cultivated for its sweet, warm, and aromatic fruit, which is much used as a carminative, and in curries.—The Giant Fennel of the south of Europe is a plant of a different genus (*Ferula*), and abounds in a fetid juice; it is indeed closely allied to asafetida. It forms a favourite food of buffaloes in Apulia, where it particularly abounds. The dry, dead stem is full of a white pith, which is used in Sicily as tinder.

Fennel (*Feniculum vulgare*):  
a, a flower.

**Fens.** See BEDFORD LEVEL.

**Fenugreek** (*Trigonella*), a genus of Leguminosae, allied to clover and melilot. The Common Fenugreek (*T. fenum Græcum*) is a native of the south of Europe, and of some parts of Asia; it is much cultivated in India as a fodder-plant, and derives its name since classic times (*Fenum Græcum*, 'Greek hay,' of which the English name is a corruption) from its use as fodder in Greece. On account of its strong smell it must, however, be mixed with other plants. The seeds also have a strong, peculiar smell, and an oily, bitter taste; the flour made from them is used for emollient poultices, but only in veterinary practice. The

seeds of Fenugreek were formerly held in great esteem in medicine, and are still largely consumed by women in the East, especially in Egypt. An Indian species (*T. incisum*) is used as fodder, and the legumes of another (*T. esculentu*) are esteemed as food.

**Fenwick**, SIR JOHN, was born about 1645, and, after serving in the army, in 1688 entered parliament as Tory member for Northumberland. He afterwards entered ardently into the conspiracy known as the Assassination Plot (see ASSASSINATION), and in 1696, being committed to the Tower, made an awful confession involving several Whig leaders in the Jacobite intrigues. Since the only witness against him had been spirited out of the country, the Whig party, furious at these charges, secured the passing of a bill of attainder against Fenwick, under which he was beheaded, 28th January 1697.

**Feodosia**, or THEODOSIA. See KAFFA.

**Feoffment** (*infundare*), the oldest and for a long period the only method for the conveyance of land known in England. Feoffment consisted in the formal conveyance of the land from the feoffor to the feoffee, the former stating distinctly the measure of the estate conferred, whether it was in Fee (q.v.), in tail, or for life. Where no mention of the duration of the estate was made, the gift was presumed to be for life. This conveyance of the land, in order to be complete, required to be accompanied by Livery of Seisin, which was of two kinds—viz. in deed and in law. In the former case, the parties being actually upon the land, the feoffor, by delivery of a twig or a turf, testified his conveyance of the land. In livery in law, the parties being in sight of the land, the feoffor referring to the land gave possession to the feoffee 'in name of seisin.' This mode of feoffment was ineffectual unless the feoffee entered into possession during the life of the feoffor. Livery in deed might be effected by attorney; but livery in law only by the parties themselves. When the practice of embodying the transaction in a deed was introduced it became customary, but not essential, to indorse on the deed the fact that livery of seisin had been made. By the statute of Frauds, passed in 1678, it was declared that no estate created by livery of seisin, unless accompanied by writing, signed by the party or his agent, should be of any effect, except as an estate at will. A feoffment is now void unless accompanied by deed. The law formerly gave so great an effect to a feoffment that a party could in some cases convey a greater estate than he had; the parties wronged by his act being dispossessed of their estates unless they could recover them by entry on the land or by action. But a feoffment now has no tortious operation. Feoffment was the form adopted for conveying the legal estate in land to trustees or 'feoffees to uses' (see USES). It must be observed that the practice of feoffment above described, and which has existed in England from time immemorial, differed materially from the old form of investiture in use in strictly feudal times, and from that which still prevails in Scotland. In England the transaction was simply a conveyance by the actual holder of the land to a new tenant, testified by certain ceremonies, but requiring no confirmation by the lord to complete it. In Scotland no transfer of heritago is complete without the formal confirmation of the superior; acceptance by the superior, and the performance of the pecuniary services attendant on that acceptance, are still preserved. See the articles INFERTMENT, SASINE, and FEUDAL SYSTEM.

**Feræ Naturæ** (Lat., 'of a wild nature') is the term given by Roman law to those animals which

are wild or not domesticated, including game animals—deer, hares, pheasants, &c. See GAME LAWS.

**Ferdansi**. See FIRDAUSI.

**Ferdinand** THE CATHOLIC, V. of Castile, II. of Aragon and Sicily, and III. of Naples, was born at Sos in Aragon, 10th March 1452, the son of John II. of Navarre and Aragon. By his father he was formally associated in the government of Aragon in 1466, and appointed king of Sicily in 1468; in 1469 he married, at Valladolid, Isabella, sister of Henry IV. of Castile. On Henry's death in 1474 most of the nobles refused to acknowledge the legitimacy of his daughter Juana ('La Beltraneja'), and proclaimed Isabella and her husband Ferdinand joint-sovereigns, who, in 1479, emerged victorious from the civil war that ensued. In that year also Ferdinand became king of Aragon on the death of his father, and the two kingdoms of Aragon and Castile were united in the persons of Ferdinand and Isabella; the latter, however, as long as she lived, maintained control and authority in Castilian affairs. The reign that followed is one of the greatest in the history of Spain, which was in a few years advanced to the first rank among the nations by the military, administrative, and diplomatic skill of its sovereigns, and of the distinguished body of ministers and generals that surrounded them.

Ferdinand's political talents found plenty of scope in the distracted condition of affairs which met him on his accession—the kingdom split into factions, feuds raging between the great houses, and robbery and outrage rife in every quarter of the country. The effectual suppression of the banditti he accomplished by reorganising the *santa hermandad*, or 'holy brotherhood,' a kind of militia-police, composed of the citizens and the country-people. Moreover, a principal aim of Ferdinand and Isabella was to break the power of the feudal aristocracy, and good use was made of the *hermandad* in carrying out this design. The establishment of the Inquisition in 1478-80, although primarily and mainly intended to further 'religious' ends, likewise helped to lessen the nobles' influence; and Ferdinand also strengthened his power by vesting in himself and his successors the grand-mastership of the military orders of Calatrava, Alcantara, and Santiago. In all his schemes he was ably seconded by his queen and by the celebrated Cardinal Ximenes.

The year 1492 was the most brilliant in his reign. It opened with the fall of Granada, which marked the end of the long struggle with the Moors; and in August Columbus set sail from Palos. Although the free exercise of their religion was guaranteed to the Moors, an edict for the expulsion of the Jews from the conquered kingdom was immediately signed; and, a few years after, the privileges secured to the Moors were treacherously withdrawn, baptism or exile being offered as alternatives. By these two barbarous and unwise acts the most industrious and civilised inhabitants of the Peninsula were driven from it. The discovery of America, however, for a time gave Spain almost unchallenged supremacy along both shores of the Atlantic, and Ferdinand turned his attention to European affairs. From France he recovered by treaty the counties of Roussillon and Cerdagne (now the Pyrénées Orientales), which his father had mortgaged to Louis XI.; in 1495 he formed the Holy League, with the pope, the emperor, and the states of Milan and Venice (Henry VII. of England was persuaded to enter the league nearly sixteen months later), under which Gonsalvo de Cordova drove the French out of Naples; and in 1500-1 the French king was induced to join him in

the conquest and partition of Naples, only to be overreached by the Catholic king, and compelled to yield up the kingdom to him entirely three years later.

In 1504 Isabella died, and Ferdinand at once had his insane daughter Juana proclaimed queen of Castile, and himself regent; but Juana's husband, the Archduke Philip of Austria, threatening an appeal to arms, the king threw up the regency, and in 1505 married Germaine de Foix, a niece of Louis XII. of France. Philip died in September 1506, only three months after his landing in Castile; whereupon Ferdinand resumed the administration, which he retained till his death, although his position was greatly changed after Isabella's death, and he was compelled to reverse all his former policy—make an alliance with France, and buy off French claims on Naples—besides being frequently in great straits for money, so that he was for some time unable to send the second portion of the dowry required to secure the marriage of his daughter Catharine with Henry, Prince of Wales. Nevertheless, he took part in the famous league of Cambray formed against Venice in 1508, conquered Oran in Africa in 1509, and in 1512 seized a favourable opportunity to make himself master of the long coveted kingdom of Navarre—thus becoming monarch of Spain from the Pyrenees to the Rock of Gibraltar. He died at Madrigalejo, 23d January 1516, and was succeeded by his grandson, best known in history as the Emperor Charles V. Ferdinand's ability, both as a general and as a statesman, has been variously estimated; but at least his skill and shrewdness as a negotiator were unsurpassed in an age of cunning and unscrupulous diplomatists. A characteristic anecdote relates that, on hearing of a complaint made by Louis XII. that he had cheated him once, he promptly answered: 'He lied, the drunkard! I cheated him three times.' Yet to Ferdinand and Isabella Spain owes her unity and greatness as a nation, and under them the foundations were laid of the unrivalled and imperial influence which, in the brilliant reign of their successor, she exercised over Europe. See Prescott's *History of the Reign of Ferdinand and Isabella* (3 vols. Boston, 1838).

**Ferdinand I.**, emperor of Germany from 1556 to 1564, was born at Alcalá in Spain in 1503. He was the son of Philip I., and brother of Charles V., whom he succeeded in the empire in 1556, having been previously elected king of the Romans (1531). Already, in 1521, Ferdinand had married Anna, daughter of Ladislaus, king of Bohemia and Hungary; and when her brother Louis fell in 1526 in battle with the Turks, leaving no issue, he claimed the crown in right of his wife. This involved him in a long and bloody struggle with a rival, John Zápolya, who laid claim to Hungary, and who, as well as his son Sigismund, was supported by Soliman, sultan of the Turks. Ferdinand at last gained the upper hand, bought off the Turks by a yearly tribute, and finally secured Hungary and Bohemia to the House of Austria. When he was elected emperor the concessions he had made to the Protestants caused the pope, Paul IV., to refuse to acknowledge him. That pope dying, his successor, Pius IV., was more complaisant; but the electors resolved that for the future the consent of the pope should not be asked; and this was carried out. Ferdinand made several attempts to reconcile his Protestant and Catholic subjects, and urged, though fruitlessly, the reformation of abuses on the Council of Trent. He died in 1564, leaving the reputation of a prudent and enlightened ruler, and was succeeded by his son Maximilian II. See Bucholtz, *Geschichte der Regierung Ferdinands I.* (9 vols. Vienna, 1831-38).

**Ferdinand II.**, emperor of Germany from 1619 to 1637, was born at Gratz, 9th July 1578. He was grandson of Ferdinand I., his father being Charles, Archduke of Carinthia and Styria, the younger brother of Maximilian. His mother, Maria of Bavaria, early inspired him with hatred against the Protestants, and he was educated by the Jesuits at Ingolstadt, along with Maximilian of Bavaria. It is said that at Loretto he took a solemn oath before the altar of the Mother of God to reinstate Catholicism as the sole religion of his dominions at any cost. As soon as he succeeded to the government of his own duchy of Styria, he set about putting down Protestantism by force. He attempted the same in Bohemia and Hungary, of which countries he had been elected king during the lifetime of his cousin, the childless emperor Matthias; but though at first unsuccessful, and even in danger of losing his dominions, he ultimately managed, with the aid of the Catholic League and of the Elector John George I. of Saxony, to subdue them. Bohemia lost all its privileges, and by merciless hanging, confiscation of property, and the banishment of innumerable families, was reduced to obedience, while by the introduction of the Jesuits, and rigorous persecution of Protestants, he re-established Catholicism. His measures were less entirely successful in Hungary. Meanwhile Ferdinand had been elected emperor of Germany (1619). The war that had already been begun was now transferred to a wider area, and took the character of a religious war—the famous 'Thirty Years' War' (q.v.). The two imperial generals, Tilly and Wallenstein, were opposed by a confederacy of the Protestant states of Lower Saxony, with Christian IV. of Denmark at their head; but the confederates were defeated by Tilly at the battle of Lutter, in Brunswick, and forced to conclude peace at Lübeck in 1629. Confident in the ascendancy which he had acquired, Ferdinand in the same year issued an edict of restitution for the whole of Germany, taking away from the Protestants nearly all the rights they had acquired by a century of struggles; and the troops of Wallenstein and of the League were immediately set to work to carry out this edict in several places. But his further success was soon arrested by the dismissal of Wallenstein, on which the diet of the empire at Ratisbon had insisted, by the opposition of Richelieu, and by the arrival upon the troubled scene of the great Protestant hero, Gustavus Adolphus of Sweden. After the murder of Wallenstein, at which the jealous Ferdinand connived to his eternal disgrace, the imperial commander, Gallas, by the victory of Nordlingen (1634) detached Saxony from the Swedish alliance; but the ability of the Swedish generals, for whom Austria had none that were a match, and the open part that France now took in the contest, brought back the balance of victory so far to the Protestant arms, that ere the wretched Ferdinand died, February 15, 1637, he had lost all hope of ever attaining the object he had pursued with such unceasing and relentless constancy. His reign is one of the most disastrous in history; for Germany owes him nothing but bloodshed, misery, and desolation. See Hurter, *Geschichte Ferdinands II.* (11 vols. Schaffh. 1850-64).

**Ferdinand III.**, emperor of Germany from 1637 to 1657, was the son of Ferdinand II., and was born at Gratz, 11th July 1608. He was not so much under Jesuitical and Spanish influences as his father. Having accompanied the armies in their campaigns after the death of Wallenstein, he had witnessed the miseries of war, and was inclined for peace; but the conflicting interests of the individual belligerents hindered any unity of view, and made it necessary to proceed with the struggle. Thus was this miserable war protracted, ever

extending in circuit, and increasing in devastation from the growing licentiousness of the soldiery. At last, in 1643, a congress met at Münster to arrange terms of peace, which was concluded in 1648, and is known as the Peace of Westphalia. At the diet of the empire (1653-54), the last presided over by an emperor in person, Ferdinand effected important alterations in the administration of justice. He died 2d April 1657, shortly after concluding an alliance with Poland against Sweden, and was succeeded in the German empire by his son Leopold I.

**Ferdinand I.**, emperor of Austria from 1835 to 1848, was born at Vienna, 19th April 1793, and died at Prague, 29th June 1875. See AUSTRIA.

**Ferdinand I.**, king of the Two Sicilies, was the third son of Charles III. of Spain, and was born 12th January 1751. When his father ascended the Spanish throne in 1759 Ferdinand, though a minor, succeeded him on the Neapolitan throne, under a regency, as Ferdinand IV. After his marriage, in 1768, with Maria Caroline, daughter of the Empress Maria Theresa, he fell completely under her influence, and lost all his former popularity. The queen and her favourite minister Acton (q.v.) ruled the kingdom. Ferdinand joined the coalition of England and Austria against France in 1793, and in 1798 occupied Rome, but soon fled panic-stricken before the French to Sicily on board Nelson's fleet. The French thereupon entered Naples, and set up the short-lived Parthenopean Republic, but were soon obliged to abandon the city and make room for the return of Ferdinand, who contrived to establish his power under the shadow of Nelson's ships. At length, however, in 1801 Ferdinand was forced to enter into a treaty with the First Consul. A subsequent violation of this treaty compelled him in 1806 again to take refuge in Sicily, under the protection of the English. A French army marched into Naples, and took possession of the kingdom, which Napoleon bestowed first on his brother Joseph, and afterwards on Murat. Ferdinand was reinstated by the Congress of Vienna, and entered Naples, after Murat's flight, in June 1815, and in the December of next year united his two states into one, and assumed the title of king of the Two Sicilies. His queen had already died in 1814. He had sworn before his recall to grant a constitution, and a popular movement in 1820 compelled him to renew his pledge, but with the help of an Austrian army the year after he shamefully broke his word and established a rigorous reign of despotism. He died January 4, 1825, and was succeeded by his son Francis I., who died in 1830. See J. Coidy Jeaffreson, *The Queen of Naples and Lord Nelson* (2 vols. 1889).

**Ferdinand II.**, king of the Two Sicilies, grandson of the preceding, son of Francis I. by his second wife, Isabella Maria of Spain, was born at Palermo, 12th January 1810. He succeeded his father in 1830, and after a brief period of promise soon showed himself as corrupt and worthless as king as his predecessors. His first wife, a daughter of Victor Emmanuel I., dying in 1836, he married Maria Theresa, daughter of the Archduke Charles of Austria, and consequently gave himself more and more up to Austrian counsels, which saw danger for the whole peninsula in liberal measures. Henceforward Naples became the scene of incessant conspiracy, insurrection, bloodshed, and political prosecutions. Ferdinand yielded to the storm of 1848, and granted a constitution to both parts of his dominions, but the Sicilians mistrusted, and with reason, the king's pledges, and declared that he and his family had forfeited the Sicilian crown. Ferdinand followed the constitution so far as to call the promised national parlia-

ment together, but quickly dismissed it, impatient of any interference with his authority. He subdued the revolt in Sicily by the inhuman bombardment of its chief cities that earned him the epithet of 'Bomba,' which will live in history to his eternal dishonour. He now completely set aside the new constitution, while all who had taken any part in state reforms were subjected to those cruel persecutions which the Letters of Mr Gladstone in 1851 held up to the execration of the world. Bomba died 22d May 1859, and was succeeded by his son Francis II., the weak and cowardly 'Bombino,' whose reign of cruelty quickly fell before the victorious enthusiasm of Garibaldi and the triumphant progress of Italian unity. See Nisco, *Ferdinando II.* (Naples, 1884).

**Ferdinand III.**, Grand-duke of Tuscany, and Archduke of Austria, was born at Florence, 6th May 1769. On his father's succeeding his own brother on the imperial throne in 1790, he succeeded to the government of Tuscany. Here he inaugurated many judicial, economical, and legislative reforms; encouraged commerce, founded hospitals, and opened up good roads through the state. A lover of peaceful progress, he remained strictly neutral in the first coalition against France, and was the first sovereign in Europe to recognise and treat diplomatically with the French Republic in 1792. Next year the combined menaces of Russia and England constrained him to relinquish his neutral policy and become a passive member of the coalition formed against France, but on the French occupation of Piedmont in 1795 he speedily reassumed friendly relations with France. In 1797, in order to save his states from annexation to the Cisalpine Republic, Ferdinand concluded a treaty with Bonaparte on most unfavourable terms, undertaking to pay a war-levy to France, and to transfer to the Museum of Paris some of the chief masterpieces of the Florentine galleries, among them the 'Venus de' Medici.' The continued intrigues of France in his states drove him into an Austrian alliance, which furnished Bonaparte with a pretext for declaring war simultaneously against Austria and Tuscany. In 1799 Ferdinand retired to Vienna, leaving the French troops in occupation of Tuscany, and in 1801, at the peace of Lunéville, he was forced to renounce all claim on Tuscany. The peace of Paris, however, reinstated him in Tuscany in 1814, and even restored his art-treasures. He died 17th June 1824, leaving his states to his son Leopold II.

**Ferentino**, a town of Italy, 55 miles by rail S.E. of Rome. Portions of its ancient walls are built of limestone in the cyclopean style. Pop. 7679.

**Ferghana**, a province since 1876 of Russian West Turkestan, formerly the khanate of Khokand, lies among the western ranges of the Tian-Shan mountain complex. Area, 28,222 sq. m., four-fifths of which are mountainous, the Tshetkal Mountains being in the north, and the Ala-tau and the Trans-Alatau chain in the south. The rest of the province consists of the fertile irrigated plain of the Syr Daria (Jaxartes), which traverses Ferghana from north-east to south-west. The inhabitants are estimated to number 676,000 (538,800 settled agriculturists and 137,200 nomad shepherds), and consist of Aryan Tajiks and Sarts (mostly settled), and Turkish Üzbeks, Kipchaks, and Kara-Kirghiz (principally nomads). The chief towns are Khokand (the former capital), Marghilan (the present capital), Namangan, and Andijan.

**Ferguson**, ADAM, a Scottish philosopher and historian, was born June 20, 1723, at Logierait, in Perthshire, of which parish his father was minister. He studied at the universities of St Andrews and Edinburgh, and was appointed in 1745 for his

knowledge of Gaelic chaplain to the famous Black Watch, in which capacity he was present at the battle of Fontenoy, and is said to have charged the enemy sword in hand among the foremost. In 1757 he succeeded David Hume as keeper of the Advocates' Library in Edinburgh, and was next appointed professor in the Edinburgh University, first of Natural Philosophy (1759), and subsequently (1764) of Moral Philosophy—a subject much more to his mind. While holding this office he accompanied the young Earl of Chesterfield (1774) on his travels on the Continent, and acted as secretary to the commission sent out by Lord North to try to arrange the disputes between the North American colonies and the mother-country (1778–79). The state of his health compelled him in 1785 to resign his professorship, in which he was succeeded by Dugald Stewart, who had previously been his deputy; but he was appointed to Dugald Stewart's own chair of Mathematics, and allowed to discharge its duties through Playfair. He next travelled on the Continent, and after his return lived a while at Neidpath Castle in Tweeddale, then farmed fourteen years at Hallyards in the vicinity. His last years he spent at St Andrews, where he died 22d February 1816. Ferguson gave up at fifty the convivialities of his time, and reaped the benefit in the unusual health and mental vigour he enjoyed to the last. Scott and Lord Cockburn have left graphic descriptions of the fine old man that reveal a love for his own virtues no less than mere admiration for a monument of the past. It was in his house that the boy Scott had his one memorable glimpse of Burns. Ferguson's writings are his *Essay on Civil Society* (1766), *Institutes of Moral Philosophy* (1772), *History of the Progress and Termination of the Roman Republic* (1782), and *Principles of Moral and Political Science* (1792). His *History of the Roman Republic* was long a standard authority on its subject, was translated into both French and German, and was recommended by Carlyle in his rectorial address at Edinburgh as 'particularly well worth reading.' See Memoir by John Small (1864).

**Ferguson, JAMES**, a self-taught Scottish astronomer, was born near Rothiemay, in Banffshire, 25th April 1710. His father being a poor day-labourer, he enjoyed only three months of instruction at school, and his subsequent acquirements were the result of his own insatiable thirst for knowledge. His natural bent was chiefly towards practical mechanics and astronomy; and while keeping sheep, to which he was sent at ten, he was constantly busy in making models of spinning-wheels and mills, and at night in mapping the stars with a stretched thread and beads strung upon it. After working some years at cleaning clocks, making sun-dials, and the like, he took to drawing patterns for embroidery and copying pictures and prints with pen and ink. He then supported himself and his parents by drawing portraits, first in Edinburgh, and after their death in London; his leisure time being all the while given to making orreries, and to other astronomical pursuits. In 1748 he began lecturing on astronomy and mechanics with great acceptance. In 1761 he received from George III. a pension of £50, and he was elected F.R.S. two years later. He now gave up portraits, and devoted himself to lecturing throughout the country, and to writing on his favourite subjects with an assiduity unbroken by unhappy domestic circumstances. He died in London, 16th November 1776. Ferguson's principal works are *Astronomy explained upon Sir Isaac Newton's Principles* (1756; 13th ed. revised by Sir David Brewster, 2 vols. 1811), and *Lectures on Mechanics, Hydrostatics, Pneumatics, and Optics* (1760; also edited by Brewster, 1805). See the

Life by Dr Ebenezer Henderson, with an Autobiography (1867; 2d ed. 1870).

**Ferguson, PATRICK**, inventor of the breech-loading rifle, was born in 1744 at Pitfour, Aberdeenshire, and, entering the army in 1759, served in Germany and Tobago. In 1776 he patented his rifle, firing seven shots a minute, and sighted for ranges of from 100 to 500 yards; and with it he armed a corps of loyalists, who helped at the battle of Brandywine (1777) to defeat the American army. He himself had a chance there of picking off an officer, but 'let him alone, disgusted with the idea of firing at the back of an unoffending individual, who was acquitting himself very coolly of his duty.' Next day he learned that the officer was Washington. Three years later, on October 7, 1780, Major Ferguson fell, defending King's Mountain, South Carolina, with 800 militia against 1300 Americans. This affair, which was not unlike that of Majuba Hill, turned the tide of southern warfare. See James Ferguson's *Two Scottish Soldiers* (Aberdeen, 1888).

**Ferguson, ROBERT**, the 'Plotter,' was born about 1637, near Alford, in Aberdeenshire, and in 1662 was ousted as a Presbyterian from the Kentish vicarage of Godmersham. As Shaftesbury's right hand, as Monmouth's 'evil genius,' he played for ten years a leading part in every treasonable scheme against the last two Stuart kings, and twice had to flee the kingdom. But after the Revolution, of which in 1706 he published a History, he changed sides, and conspired as busily for the losing Jacobite cause. He died, wretchedly poor, in 1714. His younger brother, James, commanded a brigade at Blenheim, and died very suddenly at Bois-le-Duc in 1705. See *Ferguson the Plotter* (1887), by James Ferguson, and his *Two Scottish Soldiers* (1888).

**Fergusson, SIR SAMUEL**, poet and Celtic scholar, was born at Belfast in 1810, educated at Trinity College, Dublin, and called to the bar in 1838. He gave himself more to Irish antiquities than to law, and in 1867 was appointed the first Deputy-keeper of Records in the Four Courts, in which capacity his qualities of organisation and arrangement were conspicuous. As president of the Royal Irish Academy he gave a powerful impetus to the scientific study of early Irish art, and its *Transactions* contain many invaluable papers from his pen. In 1878 he was knighted, and in 1886 the genial, humorous, and kindly *doyen* of Irish antiquities passed away. His fine musical and spirited poems, which were steeped in the truest patriotism, early began to appear in the magazines, and filled the volumes, *Lays of the Western Gael* (1865); *Congal, a Poem in Five Books* (1872); *Poems* (1880); and *The Forging of the Anchor* (1883). His edition of *Leabhar Breac* appeared in 1876; his *Ogham Inscriptions* in 1887.

**Fergusson, JAMES, D.C.L., F.R.S.**, 'the historian of architecture,' was born at Ayr in 1808, and after spending some years as an indigo-planter in Bengal, explored nearly every corner of India, sketching and studying the rock-temples, which were illustrated in his earliest works. His invaluable *History of Architecture* (4 vols. 1865–76) appeared first as a *Handbook* in 1855. He published works on fortification, particularly on the defences of Portsmouth, and was a member of the Royal Commission on the defences of the United Kingdom. His other works include *The Palaces of Nineveh and Persepolis Restored* (1851), *Tree and Serpent Worship* (1869), and a *History of Rude Stone Monuments* (1872). He died 9th January 1886.

**Fergusson, ROBERT**, a Scottish poet, was born at Edinburgh, 5th September 1750, the third son of an industrious clerk from Aberdeenshire. A bursary for boys of his name enabled him to get

a good education at Dundee grammar-school and St Andrews University, where he took to writing verses, and discovered his disinclination for the clerical life to which he had been destined. Medicine proving equally distasteful, he found employment at Edinburgh in the office of the commissary clerk, contributing the while to *Ruddiman's Weekly Magazine* poems which quickly gained him such local reputation as unhappily proved his ruin. His society was eagerly sought, and in that convivial time he was led into excesses which permanently injured his health. At last he fell into a religious melancholy, which became complete insanity after an injury to the head received in a fall down-stairs. He died on the 16th October 1774, and was buried in the Canongate churchyard, where fifteen years later Burns, at his own expense, erected a memorial-stone with a poetical inscription over his grave. His poems were collected in 1773. There are editions by T. Ruddiman (1779), D. Irving (1800), Robert Chambers (1840), and A. B. Grosart (1851). As a poet Fergusson possessed vigour, fancy, fluency in versification, and an original vein of comic humour, but lacked imagination, energy, and passion. Such poems as 'The King's Birthday,' 'Braid Claithe,' and 'Leith Races' are remarkably happy in hitting off the ludicrous side of local manners; 'The Farmer's Ingle' has a more lasting interest as the prototype of 'The Cot-tar's Saturday Night.' Burns had an admiration for his predecessor entirely out of proportion to his merits, and his earliest poetry was written under the shadow of 'his elder brother in the Muses.'

**Fergusson**, SIR WILLIAM, surgeon, was born at Prestonpans, Scotland, on 20th March 1808. He studied medicine in the schools of Edinburgh, and was subsequently (1836) elected a surgeon in the infirmary. But in 1840 he left Edinburgh for London, having accepted the chair of Surgery in King's College, together with the post of surgeon in the hospital attached to the college. In 1866 he was made a baronet, in 1867 serjeant-surgeon to the Queen, and in 1870 he became president of the Royal College of Surgeons, London. He died in London on 10th February 1877. As a surgeon he proved himself a fit rival to Liston and Syme, performing his operations with great boldness, skill, celerity, and coolness. He especially distinguished himself in cases of stone, cleft palate, diseased leg and arm bones, diseased jaw, tumour, and harolip. See H. Smith, *Sir W. Fergusson, a Biographical Sketch* (Lond. 1877).

**Ferice**, the ancient Roman term for holy days during which political and legal transactions were suspended, and slaves enjoyed a cessation from labour. Ferice were thus *dies nefasti*, the opposite of the *dies fasti*. Days which were consecrated to a particular divinity, on which any public ceremony was celebrated, and the like, were ferice. In contradistinction to these, which were *ferice publicae* or public holidays, there were *ferice privatae*, which were observed by single families in commemoration of some particular occurrence of importance to them or their ancestors. Birthdays, days of purification after a funeral, and the like, were also observed as family ferice. See FASTI.

**Feringhee**, a name applied in the East to Europeans, whose land is vaguely called *Feringistan*. The term is a corruption of Frank, and dates from the Crusades.—In Bengal the mixed descendants of the Portuguese, while differing only in religion from the natives, are especially distinguished by the title of *Feringhis*.

**Ferishtah**. MOHAMMAD KASIM HINDU SHAH FERISHTA, or FERISHTAH, a celebrated Persian historian, was born towards the end of the 16th century, at Astrabad, on the Caspian Sea. At a

very early age he went with his father to India, where we find him, when twelve years old, at Ahmednagar, in the Deccan. Here he afterwards became captain in the bodyguard of Murtaza Nizam Shah; and when this king was deposed by his own son, Ferishtah went to Bijapur (998 A.H., 1589 A.D.), where the reigning monarch received him with great honour. His death is supposed to have taken place shortly after the year 1612. His great work is the *Tarikh-i-Ferishtah*, or History of the Mohammedan power in India, which he finished in 1018 A.H. (1609 A.D.). Twenty years were spent in its preparation, and the number of books used for and partly embodied in it amounts, according to Ferishtah himself, to thirty-five. It consists—besides a preamble or introduction on the Progress of Mohammedanism in India, and a final treatise on the geography and the climate of India—of twelve divisions, treating of the kings of Ghizni and Lahore, Delhi, the Deccan, Guzerat, Malwa, Candesh, Bengal and Bohar, Multan, Sindh, Cashmere, Malabar, and of the saints of India. Written with an impartiality, simplicity, and clearness rare in an Eastern work, this history has become a standard work on the subject, into which it was the first to enter at length. Single portions of it were translated by Scott and others; but the whole work, edited first by Colonel Briggs (2 vols. fol. Bombay, 1831), was also translated by him (4 vols. Lond. 1832).

**Fermanagh**, a county of Ireland, in the south-west of the province of Ulster, 45 miles long by 29 broad; area, 714 sq. m., of which 166 are arable, 368 pasture, about 100 uncultivable, and 72 water (including Upper and Lower Lough Erne). The surface is mostly a succession of mountains and hills, culminating in Belmoro (1312 feet); the rocks include limestone, with many cavities and underground watercourses, millstone grit, and old red sandstone. Some coal, iron, and marble occur. The principal river is the Erne, which traverses the county in the direction of its longest axis. The soil in the low grounds is a deep rich loam, but in the limestone and sandstone districts it is cold and thin. The climate is mild and moist, though healthy. The chief products are oats, barley, wheat, potatoes, turnips, and hay; the chief exports, oats, butter, and eggs; and a little coarse linen is manufactured. Fermanagh is divided into 8 baronies and 23 parishes. It returns 2 members to parliament. Pop. (1851) 116,047; (1861) 105,768; (1871) 92,794; (1881) 84,879, of whom 47,228 were Roman Catholics. Enniskillen is the county town. Among the antiquities are a round tower and St Mary's Abbey on an island in Lough Erne, Danish raths, and ruined castles.

**Fermat**, PIERRE DE, a French mathematician, was born at Beaumont de Lomagne, near Montauban, in 1601, and at an early period, in conjunction with his friend Pascal, hit upon a very ingenious mode of considering figurate numbers, upon which he subsequently based his doctrine of the calculation of probabilities. Fermat employed himself greatly with the properties of numbers, and made many acute discoveries in regard to their composition and analysis. He also squared the parabola in a much simpler way than Archimedes at an earlier period had done, and made many other discoveries in geometry. His method of finding the greatest and least ordinates of curved lines was analogous to the method of the then unknown differential calculus. In addition to his scientific attainments Fermat possessed an extraordinary knowledge of ancient and modern languages. He died at Toulouse, 12th January 1665. A collection of Fermat's works appeared at Paris in 1670-79.

**Fermentation** (Lat. *fervere*, 'to boil'), a change brought about in organic liquids by the

agency of a ferment. Ferments are of two classes, *soluble and organised*. (1) *Soluble ferments, or zymoses*.—This class is of less importance than the other. When isolated, the ferments are white, amorphous substances, freely soluble in water and in glycerine, and usually insoluble in alcohol. They are found in grain which has germinated (malt), in saliva, gastric juices, &c., and also usually occur along with organised ferments, like yeast. The commonest soluble ferment is Diastase (q.v.), occurring in malt. Others of considerable importance are ptyalin, found in saliva; pepsin, in gastric juice; synaptase, in bitter almonds; myrosin, in mustard, &c. These all resemble one another very closely in properties, and all have the power to cause substances like starch and cane-sugar to combine with water, forming glucose and analogous uncrystallisable sugars, thus:

Cane-sugar.    Water.                      Dextrose.                      Levulose.  
 $C_{12}H_{22}O_{11} + H_2O = C_6H_{12}O_6 + C_6H_{12}O_6$

Diastase converts the starch contained in barley first into dextrine, then into glucose or grape-sugar, thus:

The same effects can be produced by boiling these bodies with dilute acids. Soluble ferments act most rapidly at a temperature of 75° C. (167° F.), and are destroyed by boiling. Their action is impeded or entirely stopped by many substances such as borax, citric and tartaric acids, and some antiseptics; on the other hand, prussic acid, mercurial salts, alcohol, chloroform, ether, and essential oils have little effect on soluble ferments.

(2) *Organised Ferments*.—The chemical changes induced by these always depend on the life-process of minute organisms (see GERM THEORY) which feed upon sugar or other substances in solution, and excrete the product of the fermentation. Fermentation nearly always consists of a process of breaking down of complicated organic substances like sugar into simpler ones like alcohol and carbonic acid. Economically, alcoholic fermentation is of far greater importance than any other. It is caused by the so-called yeast-plant (*Saccharomyces cerevisiae*) in solutions containing uncrystallisable sugar (glucose). The sugar may be originally in various forms. In malt extract for beer it exists as glucose or dextrose; in grape-juice for wine manufacture, chiefly as glucose; in potatoes for making potato-spirit or 'mare,' as starch; or, finally, as cane-sugar itself. The latter two, when fermented, are first converted by the soluble ferment which accompanies yeast into glucose, and that is then transformed by the yeast itself into alcohol, carbonic acid gas, and small quantities of glycerine, succinic acid, and other substances.

Brewers' yeast contains an enormous number of one-celled organisms (*Saccharomyces cerevisiae*), on which its activity entirely depends. Under the microscope these are seen to be colourless, nearly transparent, roughly spherical bodies of a diameter of about 0.00035 inch. When the conditions are favourable—i.e. nourishment plentiful, and temperature about 80° F., the yeast-cells multiply very rapidly by budding. When food is deficient they may multiply by the formation of spores. Fermentation of grape-juice to form wine depends on organisms of the genus *Saccharomyces*, of which there are many species not yet very sharply defined. The various species are found in different kinds of wine must, or even in different positions in the same fermenting-vat.

Putrefaction and rotting are very much akin to fermentation, and all depend on the presence and growth of minute organisms.

The following are some of the varieties of fer-

mentation which possess considerable importance or interest:

*Acetous Fermentation*.—It has long been known that wine under certain circumstances absorbed oxygen from the air and turned into vinegar. This is now known to be due to the conversion of the alcohol into acetic acid by an organism, the *Mycoderma aceti*. The wine is allowed to trickle slowly through barrels filled with beech-shavings, through which fresh vinegar has previously been poured in order to impregnate the shavings with the 'mother of vinegar,' which contains the *Mycoderma*. Under the microscope the *M. aceti* appears as very minute elongated rods (diameter about 0.00008 inch) united into chains.

*Lactic fermentation* is the cause of the souring of milk. It is caused by a definite rod-like organism or bacillus, which reaches the milk from the air. The life-conditions of this ferment are almost the same as those of the yeast ferment, but there are certain substances attacked by the one and not by the other, and *vice versa*. During lactic fermentation the sugar of milk is converted into lactic acid, which ultimately causes the curdling of the milk.

*Butyric Fermentation*.—This is one of a large number of processes of fermentation usually roughly classed as putrefaction, on account of the foul smell produced during the action. It is caused by an organism (*Fermentum butyricum*) which has the power of breaking down such substances as sugars, starches, tartaric and citric acids, and albumenoid substances, producing butyric acid and carbonic acid.

*Ammoniacal Fermentation* is also one of the processes which form part of putrefaction. Most organic substances containing nitrogen yield ammonia as one of the products of putrefaction. This process is of great importance in nature, as by it nitrogenous animal matter, contained in manure, is converted into salts of ammonia, which can be absorbed by earth. They are then acted on by the nitrifying organism which is found in all fertile soils, and by it slowly oxidised into nitrates, which can then be absorbed by the roots of plants.

*Conditions of Fermentation*.—As all fermentation, except that produced by soluble ferments, is caused by living organisms, the optimum conditions of fermentation are (1) sufficiency of nourishment and moisture; (2) temperature about blood-heat (98° F.); (3) absence of poisonous substances. Deficiency of nourishment or water may kill a ferment, or may cause it to form spores, which then resist dying, and may even exhibit vitality after boiling, which is instantly fatal to all active ferments. A low temperature renders ferments inactive, a temperature much above 100° F. is fatal to their life. All antiseptic or disinfectant substances (see ANTISEPTICS), such as corrosive sublimate, chlorine, fumes of burning sulphur, eucalyptus-oil, act by impeding or destroying the life of the ferments. Many of the products of fermentation are themselves antiseptics, as in the case of alcohol, so that alcoholic fermentation always arrests itself when the spirit has reached a certain strength. Some ferments cannot live in presence of air, others require it; while others again are indifferent to it. For further information, see *Fermentation*, by Schützenberger (Inter. Sc. Series), and the article 'Fermentation' in Thorpe's *Dictionary of Applied Chemistry*.

FERMENTED LIQUORS are alcoholic beverages made by fermentation of saccharine fluids and juices; the principal being the different kinds of *ale* or *beer*, made by fermentation of an infusion of malt—chiefly of barley, but also sometimes of other kinds of grain—and *wine*, made by fermentation of grape-juice. *Cider* is made by fermentation

of the juice of apples; *perry*, of that of pears; *palm-wine*, by fermentation of the sap of different kinds of palm. Fermented liquors, commonly called wines, are also made from the juice of various kinds of fruit, as currant-wine from that of the red currant; and from the juice of some roots, as parsnip-wine from that of the parsnip, &c. The sap of the American Aloe, or *Agave* (q.v.), yields the fermented liquor called *Pulque*, much used in Mexico. A wine is made from the sap of the birch, and that of some other trees is used for a similar purpose. *Mead* is a fermented liquor made from honey. From every fermented liquor a kind of *spirit* may be obtained by distillation. See BEER, WINE, &c.

**Fermo**, a town of Italy, is situated on a rocky height 4 miles from the Adriatic, and 36 SSE. of Ancona. It is well built, is surrounded with ancient walls, and has been the seat of an archbishop since 1589. Formerly Fermo possessed a university. Pop. 6692. Its port, Porto San Giorgio (pop. 3114), on the Adriatic, has some trade in corn, silk, and wool. In the immediate vicinity of Fermo are the ruins of the ancient *Ferrum*.

**Fermoy**, a clean, well-built town in County Cork, Ireland, on the Blackwater, 19 miles NE. of Cork city. Its origin dates from the 12th century, when it was the seat of a Cistercian abbey; but the present town was the creation of a Scotch merchant toward the close of the 18th century. It contains a Catholic cathedral, St Colman's College, and barracks for 3000 men. The river is crossed by a noble stone bridge, erected in 1866. The town has a trade in flour and agricultural produce. Pop. (1861) 8705; (1881) 6454.

**Fern**. See FERNS.

**Fern**, MALE, *Aspidium* (*Nephrodium*) *filix-mas*, a name given by old herbalists in contrast to the Lady Fern, *Asplenium* (*Lastrea*) *filix-femina*, which, from the aspect of their foliage and common association in woods, they imagined to represent the two sexes. The large subterranean rhizome contains a volatile oil, to which the long-established medicinal value as a vermifuge (particularly in tapeworm) is due.

**Fern**, SWEET (*Comptonia asplenifolia*), an ill-named shrub of the sweet gale order (Myricaceae) (see CANDLEBERRY), a native of the mountain-woods of North America, forming a small bush with linear, pinnatifid, fern-like leaves. Its leaves have a powerful aromatic fragrance when rubbed. It is tonic and astringent, and is used as a domestic remedy for diarrhoea.

**Fernandina**, a port of entry and capital of Nassau county, Florida, on an island 28 miles NNE. of Jacksonville, forms a terminus of the railway connecting the Atlantic with the Gulf of Mexico, and has a considerable transit trade with the West Indies, Charleston, and Savannah, its shipments of lumber exceeding 100,000,000 feet in a year. It is the seat of the episcopal bishop of Florida, and a popular bathing resort. Pop. 2562.

**Fernando Noronha**, an island of Brazil, in the Atlantic Ocean, in 3° 50' S. lat. and 32° 25' W. long. About 5½ miles long by 1¼ wide, and of volcanic formation, its general elevation is 600 to 700 feet. It is well cultivated by the Brazilian convicts, some 2000 in number, who inhabit it. Off its north-east point lie several smaller islands.

**Fernando Po**, an island on the west coast of Africa, in the Bight of Biafra, with an area of 671 sq. m., forms geologically a continuation of the Cameroonian Mountains of the mainland. The island, oblong in shape, with steep, rocky coasts, and disposed in a NNE. direction, is bisected by 2° 39' N. lat. Its northern half is almost entirely occupied by the volcanic peak (9300 feet) known to the

English as Mount Clarence, to the Spaniards as Pico Santa Isabel; and its southern half contains a short range lying E. and W. The island is covered with luxuriant vegetation. The average annual temperature at Santa Isabel, the capital (pop. 1500), is 78° F. The island is inhabited by the Bubi, a Bantu tribe, who number 20,000 to 25,000 in all, and by some negroes. Maize and yams, cacao, coffee, palm-oil, and palm-wine are the principal products. Discovered by the Portuguese Fernão do Pao in 1472, the island has belonged successively to Spain (1777-1827), England, and Spain (since 1841). See *Bulletin Par. Geog. Soc.* (1886).

**Ferney**, a village of 1131 inhabitants, in the French department of Ain, 4½ miles NW. of Geneva, and 2 miles W. of the lake. It is celebrated as the place where Voltaire (1694-1778) resided during the last years of his life. He purchased the estate in 1758, and from that time was known variously as the seigneur, the philosopher, and the patriarch of Ferney. During these years Voltaire acted as a dictator of letters throughout French-speaking Europe, and his chateau was a kind of pilgrimage resort for all sorts and conditions of literary and political celebrities.

**Ferns** (*Filices*), as the most abundant and beautiful, most varied and typical class of higher (i.e. Vascular) Cryptogams, are of special interest alike to the botanist, the horticulturist, and the lover of nature. While Linnaeus included under his Filices all the Vascular Cryptogams, since Jussieu the equisetums, rhizocarps, club-mosses, and solaginellas have been separated off as distinct classes (see HORSETAIL, RHIZOCARPS, LYCOPodium, SELAGINELLA, ISOTETES), as have more recently also the Ophioglossae (see MOONWORT).

Since what we familiarly call the fern-plant is

Fig. 1.  
Germination of Prothallium:

showing archegonia, a; antheridia, b; rhizoids, c.

Fig. 2.

A-D, archegonia; A-C, longitudinal sections; D, transverse section of neck; p, prothallium; n, neck of archegonium; c, neck canal cells; v, venter of archegonium; c', ventral canal cell; o, oosphere. E-G, antheridia in transverse section; p, prothallium; a, antheridium; s, spermatocytes. H, spermatocytes, s, escaping from their vesicle, v, which contain starch grain.

only the spore-bearing member of an alternation of generations, it is convenient for the compre-

hension of the life-history of the group, and still more for comparison with that of the other above-named Vascular Cryptogams, and of these with Gymnosperms (q.v.) and Phanerogams (q.v.), to begin with the familiar fern-spore, and trace its history round to the spore again, although necessarily only in the briefest outline. In fig. 1, A, this double-walled and characteristically formed and marked spore is represented; in B it is germinating into a short filament which soon broadens into

Fig. 3.

A, fertilised oosphere, showing first *a*, and secondly *b*, division-walls, mapping out the inclination of growth of the stem, *s*; foot, *f*; root, *r*; and first leaf, *l*. B, embryo at later stage. C, vertical leaf-stalk through prothallium, *p*; a young fern, *f*; *l*, first leaf; *s*, stem; *r*, root. D, prothallium with young fern attached to it.

a thin, flat, bilobed cellular expansion, the *prothallus*. C. This develops unicellular root-hairs from the under surface, and grows to a size varying on the average from  $\frac{3}{16}$ th to  $\frac{5}{16}$ th of an inch in diameter, resembling most nearly a small thallus of Liverwort (q.v.). It leads a perfectly independent existence, usually for several months, but sooner or later develops organs of sex, of which both are most commonly present upon the same prothallus. Near

the apex of the prothallus we find the female organs or *archegonia*, each archegonium being a flask-shaped group of cells, of which the deepest central cell enlarges greatly to become the ovum, which fills the body of the flask, while those above it undergo mucilaginous degeneration and disappear, so leaving the neck of the flask as an open way of access to the ovum from the exterior (fig. 2, A-D).

Fig. 4.

A, section along Rhizome of *Aspidium*, showing vascular bundles, *v*; stages of leaf development from apical buds to dead leaf stalk, *a-g*; scale hairs, *s*; and roots, *r*. B, transverse section of fern-rhizome, showing outside the smaller bundles, *v'*; passing out to the leaves and main bundles, *v*. The anastomosing of these, forming the netted cylinder, is shown in elevation in C. D, tip of developing leaf of *Ceratopteris*; *s*, apical cell; *b*, lateral lobe of leaf. E, longitudinal section of root-tip of *Pteris*; *s*, apical cell, developing root-cap below.

The male organs (*antheridia*) arise as epidermic papillae among the root-hairs, and segment into spheroidal groups of cells inclosing a large central

cell, which soon segments into a group of smaller cells (see fig. 2, E-G). These undergo rejuvenescence, and escape in the ciliated state as free-swimming *antherozoids*, which (the prothallus growing in damp situations) find their way towards the archegonia. One antherozoid suffices to fertilise an archegonium, and, however many archegonia may

Fig. 5.

A, Under-side of a leaflet of *Aspidium filix-mas*, with sori, *t*. B, transverse section, with a sorus consisting of the sporangia in different stages of development, *a-f*, and the indusium, *t*. C, sporangium, with annular lip-cells, *tr*, and paraphysis, *p*. D, development of spores from mother-cell, *a*.

be fertilised, the small prothallus is only able to bear a single fern-plant. The fertilised ovum segments into four portions (fig. 3, A-B) of which two segment to form the so-called *foot*, by which the young fern remains for a time attached to and supported by the parent prothallus (fig. 3, C); another goes on dividing to form the first root, while the remaining one gives rise to the stem and leaf. As the fern grows up it soon exhausts the prothallus, which dies off and disappears, and the fern gradually assumes the familiar vegetative development characteristic of the group.

The fern-stem grows forward by an apical cell (fig. 4, D); the root-tip, too, has its apical cell, which also develops a root-cap (fig. 4, E). In the mass of embryonic tissue produced by the segmentation of the apical cell we soon distinguish (a) an external *dermatogen* layer which gives rise to the epidermis and its out-growths, (b) internal strands of tissue of which many cells undergo characteristic modifications and give rise to the future fibro-vascular bundles, the whole lying imbedded in (c) the less modified ground tissue, which for the most part remains parenchymatous, but may in part become lengthened and hardened (as sclerenchymatous and prosenchymatous tissue), mainly for the purpose of increased mechanical strength. The fibro-vascular bundles form a meshwork anastomosing where bundles are given off to the leaves; they are closed and definite—i.e. contain no cambium and are

Fig. 6

A, Tassel-like variety of Male Fern (*Aspidium filix-mas*, var. *Cristata*). B, Fertile frond of Royal Fern (*Osmunda regalis*).

consequently incapable of continued growth, save by addition in length at the growing-point. Their structure is concentric, the bast surrounding the wood. The axis forms most commonly a short root-stock; this, however, in some genera grows erect to a considerable height, giving us the characteristic and beautiful somewhat palm-like type of vegetation of the tree-ferns (see TREE-FERN). The leaves are developed in a close spiral succession just behind the growing-point, and are of slow growth, usually requiring two years to develop. Even in the expanded leaf growth may continue for a long time, the indefinite growth of the twining leaf of *Lygodium* being only the extreme case of this. Their characteristic *circinate vernation*—i.e. involuted spiral or crozier-like folding in the bud—is very characteristic, and, as this must arise by a greater growth of the dorsal than the ventral surface, so the expansion of the leaf can be readily observed to be due to the temporary reversal of the disproportion, equilibrium being only reached with maturity. The leaf is sometimes entire, but is more frequently pinnate, bipinnate, or decomposed: this arises, however, in a totally different way from the pinnation of the leaves of phanerogams (see LEAF), being due to a dichotomy with unequal development of either fork alternately. The leaf-stalk or *rachis* is thus a false axis. The mode of origin is well revealed by reference to those tasselled varieties (fig. 6, A) which so frequently appear in widely distinct species in cultivation, exuberantly vegetative conditions admitting of the almost equal development of many successive secondary axes.

The process of asexual reproduction is in most ferns carried on by all the leaves indifferently (whence the attempt formerly so prevalent, but botanically unnecessary, to distinguish them from ordinary leaves as *fronds*). In many cases, however, this becomes restricted to particular portions of the leaf, apical in the common royal fern (*Osmunda regalis*, fig. 6, B), or median as in *O. interrupta*, or even to special fronds, as in the common hard fern (*Blechnum spicant*) or the parsley fern (*Allosorus crispus*). In such cases the vegetative development of the spore-bearing fronds is of course greatly checked, and we have a distinct foreshadowing of the stamens and carpels of the phanerogams (although the spores have not as yet themselves acquired any character of distinct sex, much less the sporangia and the leaves which bear them). The fern may also exceptionally bud directly from the prothallus without archegonia (*apogamy*), or the prothallus from the frond without spores (*apospory*). Many ferns (particularly *Asplenium*) also multiply directly by budding upon the fronds.

At fig. 5, A, we have a fertile pinna of the common male fern (a name which of course refers merely to an old misinterpretation of the contrast of its rough foliage with that of the lady fern), showing the patches of spore-cases, or *sori*. The same figure (B) gives a section of a sorus, with developing sporangia under its epidermic cover or *indusium*. These are simply multicellular epidermic hairs, B, C, of which the central cell of the head segments and re-segments into spores (D). The spore-case is ruptured when ripe in various ways at once of practical interest and of high systematic importance, and the spores are thus diffused in great numbers to take their scanty individual chance of germinating as new prothallia.

Systematists vary somewhat as to the orders into which to divide this very large class, which includes about 70 genera and about 3000 living species, besides a great number of extinct forms. A convenient enumeration of these, however, may be taken as follows:

A. Sporangia thick-walled and without ring, arising in the leaf-tissue, and not as epidermal

hairs (trichomes). I. Marattiaceae—4 genera, with about 30 species in tropical America, Asia, and Oceania: *Marattia*, 10; \* *Angiopteris*, 7.

B. Sporangia epidermal, with ring. (a) Ring indistinct. II. Osmundaceae—2 genera, 11 species, scattered through all regions: *Osmunda*, 7 (see ROYAL FERN); *Todea*, 4. (b) Ring well developed; 6 orders, distinguished by details of sporangial structure—viz. III. Schizaceae—4 genera, tropical: *Schizaea*, 14; *Antimnia*, 30; *Lygodium*, 30; *Mohria*, 2. IV. Gleicheniaceae—3 genera, tropical, 40 species: *Gleichenia*, 8; *Metensia*, 30. V. Hymenophyllaceae (see FILMY FERNS)—3 genera, 200 species, chiefly tropical: *Hymenophyllum*, 80; *Trichomanes*, 90. VI. Cyathaceae, chiefly Tree-ferns (q.v.)—6 genera, with about 170 species, chiefly of southern tropical and warm temperate zones: *Alsophila*, 60; *Hemitelia*, 30; *Cyathea*, 40; *Cibotium*, 6; *Dicksonia*, 20. VII. Parkeriaceae—2 genera, with only 2 species, *Ceratopteris thalictroides*, eaten as a vegetable in tropical Asia, and *Parkeria pteridioides*, found swimming in tropical American waters. VIII. Polypodiaceae. While the preceding families contain only the genera above named, or at most one or two others, the Polypodiaceae constitute the great majority (nine-tenths) of the whole group, and are widely distributed through all regions of the globe, although chiefly in warm climates. Of their families and leading genera a brief summary is therefore convenient.

(1) Sorus not covered by indusium. (a) *Acrostichaceae*, with sporangia uniformly scattered upon the back of the frond or part of it—2 genera, 200 species, mostly tropical American, East Indian, and Australasian: *Acrostichum*, 170; *Platyserium*, 5, of which some species are cultivated, the stag's-horn ferns familiar in greenhouses. (b) *Polypodiaceae*, or *Polypodies* (800 species), with sori variously arranged. (i.) Sori in streaks following the veins: *Gymnogramme*, 74, of which *G. chrysophylla* and *G. tartarea*, both West Indian, are cultivated as the Golden Fern and Silver Fern, names which well describe the characteristic beauty of the mealy wax which is so copiously secreted by glandular epidermic cells as to cover the lower surface. Sori in round or elliptical patches: *Polypodium*, 150, mostly tropical (see POLYPODY); *Phegopteris*, 70 (Beech Fern). Sori linear: *Ceterach*, of which the common Sedge Fern, *C. officinarum*, was long in repute as an astringent medicine. (ii.) Sori along the edge of the frond: may be continuous and uncovered (*Notochlaena*), or covered by a false indusium produced by the infolded edge of the frond, which is continuous in *Pteris*, 120 (see BRACKEN), discontinuous in *Allosorus*, 34 (Parsley Fern), while in *Adiantum*, 108 (see MAIDENHAIR FERN), the patches of sori are developed upon an intumed edge.

(2) Sorus covered by indusium. (c) *Aspleniaceae*, or *Spleenworts* (400 species), mostly tropical, with long or linear sori, with indusium arising laterally from above a vein: *Blechnum*, 50 (the Hard Fern); *Asplenium*, 300 (the Spleenworts); *Scelopendrium*, 8 (see HART'S-TONGUE). *Diplazium esculentum* furnishes an edible rhizome in the East Indies. (d) *Aspidiaceae*, or Shield Ferns (250 species), with dorsal sori of rounded shape, with shield-shaped or kidney-shaped indusia: *Aspidium* (*Nephrodium*), a large genus (220 species), including the Male Fern (see FERN, MALE) and many other well-known forms. Minor genera are *Cystopteris*, 9 (the Bladder Fern); *Woodia*, 11; *Struthiopteris*, 3. (e) *Davalliaceae*, with sporangia on a tooth, or in a furrow of the leaf edge—4 genera, with 200 species, almost all tropical: *Davallia*, 112.

\* The numbers following generic names indicate the approximate number of known species.

**Fossil Forms.**—We have a few fossil ferns even from the Silurian strata (Eopteris), while the Carboniferous rocks have yielded about 200 species, of which some were tree-like (Protopteris, Caulopteris, Pecopteris, perhaps also Neuropteris), while others (Sphenopteris, Hymenophyllites, &c.) appear to have formed great part of the undergrowth of the Carboniferous forest. Their remains also appear through the Secondary and Tertiary formations, approximating more nearly to those of our own day, and in the Tertiary indeed sometimes referable to existing genera (Alsophila, Lygodium, Osmunda). See PALEONTOLOGY (VEGETABLE). From the imperfect preservation of the sori and sporangia, the precise systematic position of fossil ferns can rarely with much certainty be determined.

**Uses of Ferns.**—Like other perennial stems and root-stocks, those of ferns contain a store of starch, and this becomes in many species of economic importance to communities which have not reached the agricultural stage. Foremost among these is rhizome of *Pteris caerulea*, the Tara (q.v.) of the Maoris, to which may be added *Aspidium edule* of Nepal, while the *Cyathea medullaris* in New Zealand, *Angiopteris erecta* in the South Seas, and other tree-ferns yield a kind of sago. Survivals of this use of ferns, or reversion to it in time of famine, also occur among more advanced peoples (see BRACKEN), and developing fern fronds are occasionally still eaten as a kind of salad in northern countries. Before the epoch of chemical manufactures the common ferns were a convenient source of potash, and their fronds are still often gathered as bedding for cattle. Their astringency gave them also a place in medicine, but the syrup known as *Capillaire* (see MAIDENHAIR) and the occasional use of male fern as a vermifuge alone survive in modern pharmacy. The characteristic beauty of their foliage has, however, given them in recent times a place in horticulture so important, especially in England, as to be sometimes compared to the historic Tulipomania (see TULIP) itself. The hardy ferns succeed well on shady rockwork, and the exotics under glass; their propagation, either by division of the root-stock (Davallia, &c.) or by sowing tolerably fresh ripe spores in saucers, kept moist and shaded under a glass (Pteris, Adiantum, &c.), is also easy. Many can be grown under a large bell-glass in rooms, or better in Wardian cases.

Various superstitions attach to ferns—the root of some kinds, for example, was in some places credited with the power of opening locks. By 'watching the fern' in solitude during the night of St John's Eve (24th June) one might hope to meet fairy benefactors, and receive a purse of gold; but the most widespread superstition is that fern seed, properly gathered, renders the bearer invisible. On the same eve of St John the fern puts forth at dusk a small blue flower, which soon disappears; and the wonderful seed, quickly ripening, falls at midnight, and should be caught in a white napkin. Fern seed is in some places a 'wish-seed,' enabling the bearer to attain his utmost wishes.

For guidance to the abundant literature on ferns, see Goebel's, Van Tieghem's, or other text-book of botany; the several works on ferns by Sir W. J. Hooker (*British Ferns*, *Garden Ferns*, *Filices Exotice*, *Species Filicum*); Heath's works (*The Fern World*, *Fern Paradise*, *Fern Portfolio*); also, for systematic studies, Smith's *Historia Filicum*; or general, for beginners, Moore's *British Ferns*. For information as to particular genera and species and their culture, see Nicholson's *Dictionary of Gardening*. See also De Bary (transl. by Bower and Scott, 1885).

**Fer Oligiste** is a mineralogical term applied to a variety of anhydrous red oxide of iron, Fe<sub>2</sub>O<sub>3</sub>, otherwise called *Specular Iron Ore*. See IRON.

**Ferozabad, &c.** See FIROZABAD, &c.

**Ferrandina**, a town of Italy, on a height above the Basento valley, 43 miles ESE. of Potenza by rail. Pop. 7325.

**Ferrari, NICHOLAS**, born in 1592, at fourteen entered Clare Hall, Cambridge, of which in 1610 he was elected fellow. He studied medicine, and travelled five years on the Continent (1613-18), then engaged in the business of his father, a London merchant, and in 1624 was returned to parliament. But in 1625 he retired to Little Gidding in Huntingdonshire, and founded there the religious community familiar to every reader of Mr Shorthouse's *John Inglesant*; next year Land ordained him deacon. With his brother and brother-in-law and their families the community numbered some thirty persons, who with constant services and perpetual prayer combined the occupation of fine bookbinding. Nicholas himself died on 4th December 1637, worn out by asceticism; but the 'Arminian Nunnery,' which received two visits from Charles I. (in 1633 and 1642), was not broken up by the Puritans till ten years after his death. See the two lives of Ferrari, one by his brother John, edited by Mayor (Cambr. 1855).

**Ferrara**, a city of Italy, capital of the province of the same name, is situated in the marshy delta of the Po, 30 miles from the Adriatic, and 29 NE. of Bologna by rail. First made a walled city in 604, it still is fortified with walls, bastions, ditches, and a citadel. The old castle or ducal palace of the Estes, built in the Gothic style in the 14th and 15th centuries, with corner towers, moats, and heavy machicolations, is the most conspicuous secular building in Ferrara. After the extinction of the Este family it was until 1890 the residence of the papal legates. The most notable churches are the cathedral and those of San Francesco, San Benedetto, and Santa Maria in Vado, which contain paintings by native artists (Garofalo, Dosso Dossi, &c.) and others (Guercino, Seb. Filippi). The university, founded in 1264, reorganised in 1402, closed in 1794, and reopened in 1824, has three faculties (medicine, jurisprudence, mathematics), nineteen professors, and less than forty students. Its excellent library (100,000 vols., rare incunabula, and 1000 MSS.) contains original works of Tasso, Ariosto, and Guarini. Ferrara is specially remarkable for its art associations. Under the patronage of the Dukes of Este it produced a good school of painters; in literature it is closely associated with Tasso, Ariosto, and Guarini, who, as well as Savonarola, was born at Ferrara. At the period of its greatest prosperity Ferrara had about 100,000 inhabitants; now, however, it presents a decayed appearance, and in 1881 had only 30,695 inhabitants. After passing through various vicissitudes Ferrara became subject to the house of Este about the close of the 12th century, and remained in their hands until the extinction of the family in 1598, when it passed to Pope Clement VIII. In 1860 Ferrara was incorporated in the kingdom of Italy.

**Ferrara, ANDREA**, a broadsword-maker of the 16th century, respecting whose personal history nothing is certainly known beyond the fact that he was established at Belluno in North Italy in 1555, where, along with his brother, he enjoyed great repute as an armourer. According to a tradition long current in Scotland, he was a Spaniard by birth; but the probability that he was an Italian and a native of the city of Ferrara is quite as strong. It is claimed for him that he tempered sword-blades by the same method as that employed by the smiths of Damascus. See *Cornhill Magazine*, vol. xii. (1885).

**Ferrari, GAUDENZIO**, Italian painter, was born at Valduggia, in Piedmont, in 1484. A scholar of

Andrea Scotto, he also caught some inspiration from Da Vinci and Raphael. The chief characteristics of his style are correct and vigorous delineation, strong but often hard colouring, considerable power of invention, and skill in the arrangement of drapery. He executed innumerable paintings both in fresco and in oil, the greater part of which are possessed by the Lombard galleries. His most comprehensive work, the frescoes at Varallo, in Piedmont, represents the Passion; another good specimen of his work, the 'Martyrdom of St Catharine,' is in the Brera Gallery at Milan. He died at Milan in 1549. The chief of his pupils was Andrea Solario. See Colombo, *Vita di Ferrari* (Turin, 1881).

**Ferrari**, PAOLO, Italian dramatist, was born at Modena in 1822, and produced his first comedy, *Bartolommeo il Calzolaio*, in 1847. Of his many later works, *Goldoni* (1852) and *Parini e la Satira* (1857) rank as the finest examples of modern Italian comedy, and are distinguished—as, indeed, are most of his plays—by a piquancy and sparkling dialogue, as well as cleverness of construction and occasional sharp contrasts, such as have been mostly identified with French comedy. A collection of his *Opere drammatiche* was published at Milan in 14 vols. (1877–80). In 1860 he became professor of History at Modena, and afterwards in the Academy at Milan, where he died 10th March 1889.

**Ferrates** are combinations of ferrie acid,  $\text{HFeO}_3$ , a weak unstable compound of iron and oxygen, with bases. See IRON.

**Ferrers**, LAWRENCE SHIRLEY, EARL, the last nobelman who died a felon's death in England, was born in August 1720, and succeeded to the peerage as fourth earl in 1745. He was subject to ungovernable paroxysms of passion, in the fury of one of which he killed his old land-steward in January 1760, for which, being tried by his peers in Westminster Hall, he was hanged at Tyburn on the 5th May following.

**Ferret** (*Putorius furo*), a half-tamed albino variety of the polecat (*P. furtivus*). It is slightly smaller than the wild form, measuring about 14 inches in length without including the tail, and has white or yellowish fur and the usual red—i.e. unpigmented eyes. Like some other albinos, it is delicate and requires to be carefully housed in cold weather. The variety is virtually constant, except when the ferrets breed with polecats, which they will readily do; then a 'variety-hybrid' with intermediate colouring results. The ferret has been for long in human hands, for Aristotle knew it, and the Romans used it as we do. It seems to have originated in Africa, or in southern Europe—e.g. Greece—and may have been reared by the ancient habit of keeping a polecat to hunt for mice, before the days of the domestic cat. In spite of its long training, it is hardly tame, far less affectionate, and needs to be looked after lest it go chicken-hunting on its own account. Even infants are not safe from its deeply ingrained thirst for blood. It is used both in Europe and America to kill rats, to hunt out rabbits, and even to catch

Ferret (*Putorius furo*).

fowls, which it can kill very neatly with a single bite on the neck. Like its relatives, it is brave as well as bloodthirsty, and will attack a large rat without hesitation. In hunting rabbits it is often allowed to work its will in the warren, the terrified inmates being shot or snared as they bolt. Frequently, however, the ferret has a long string attached, so that it may be pulled out. In other cases it is muzzled, and sometimes even belled. Without muzzle or leash there is always a risk of losing the ferret, for if hungry he may gratify his natural inclinations on the first rabbit and fall asleep after his meal, or he may get so excited over his work that he will refuse to come out for days. In time, however, desire for water brings him to the surface again; for blood, as Jeffries remarks, causes great thirst. The ferret generally breeds twice a year, each brood consisting of six or nine, which the mother sometimes devours. See ERMINE, POLECAT, WEASEL.

**Ferriecyanogen**, or FERRICYANOGEN, a compound radical supposed by chemists to exist in ferriecyanic acid and the ferriecyanides. It cannot exist in the free state. The most important of the ferriecyanides is that of potassium, also called red prussiate of potash. It is prepared by passing a stream of chlorine gas into a solution of potassium ferrocyanide till the liquid turns dark red; on evaporation the salt is obtained in crystals. The reaction is as follows:

The chief use of potassium ferriecyanide is for the manufacture of Turnbull's blue, an important dye. This substance is formed when a solution of a ferriecyanide is mixed with that of a ferrous salt (green vitriol, for instance); it consists of ferrous ferriecyanide,  $\text{Fe}_3\text{K}_3(\text{CN})_{12}$ . Ferric salts yield no precipitate with ferriecyanides. Strong acids separate ferriecyanic acid,  $\text{H}_3\text{Fe}_2(\text{CN})_{12}$ .

**Ferrier**, DAVID, a distinguished physician and scientist, was born at Woodside, Aberdeen, in 1843, and educated at the university there, where he graduated with the highest honours in 1863, and soon after gained the inter-university distinction of a Ferguson scholarship. After a period of study at Heidelberg he settled as a student of medicine at Edinburgh, and graduated in 1868 at the close of an exceptionally distinguished course. In 1872 he was appointed professor of Forensic Medicine at King's College, London, and afterwards became physician to its hospital, and also to the National Hospital for the Paralysed and Epileptic. He was elected Fellow of the Royal Society in 1876, of the Royal College of Physicians the following year, and was made LL.D. by Aberdeen in 1883. Dr Ferrier's chief scientific work has been in the region of the brain, and its relations to such diseases as epilepsy, his name being especially famous for a brilliant series of experimental researches into the localisation of its functions, which have made him a *bête noire* to the anti-vivisectionists at any price. In 1876 he published *The Functions of the Brain*, which was followed by *The Localisation of Cerebral Disease* (1878), and 'The Effect of Lesion of Different Regions of the Cerebral Hemispheres' (with Professor Yeo) in part ii. of the *Royal Society's Transactions* for 1884 (see BRAIN). He was one of the founders, and is still an editor, of the well-known journal, *Brain*.

**Ferrier**, JAMES FREDERICK, metaphysician, was born in Edinburgh, June 16, 1808. His father was a brother of Miss Ferrier, the novelist; his mother, a sister of Christopher North. He was educated by Dr Duncan at Ruthwell, at the Edinburgh High School, and at Greenwich by Dr

Burney, next entered the university of Edinburgh, and passed thence to Magdalen College, Oxford, where he graduated B.A. in 1831; next year he was admitted to the Scottish bar, but never practised, while the dominant influence of Sir William Hamilton made him a metaphysician. In 1842 he was elected to the chair of History in the university of Edinburgh, and in 1845 to that of Moral Philosophy in the university of St Andrews. Ferrier early attracted notice by some metaphysical essays, which appeared in *Blackwood's Magazine*; and in 1854 he published the *Institutes of Metaphysics*, in which he endeavours to construct a system of idealism in a series of propositions demonstrated after the manner of Euclid. He afterwards edited the collected works of his uncle and father-in-law, Christopher North. His own *Lectures on Greek Philosophy* were edited in 1866, with a life prefixed, by his son-in-law, Sir Alexander Grant. Ferrier died at St Andrews, June 11, 1864.

**Ferrier**, SUSAN EDMONSTON, Scottish novelist, was born in Edinburgh in 1782. Her father, James Ferrier, one of the principal clerks of the Court of Session, and the colleague in that office of Sir Walter Scott, lived on terms of intimacy with the wits and literati of his day in Edinburgh, and Miss Ferrier's talents and quick powers of observation were early called into play in the midst of the literary society in which her youth was passed. Her first work, *Murriage*, begun in 1810 in concert with Miss Clavering, but soon relinquished by the latter, appeared in 1818, and this was followed by *The Inheritance* (1824), and *Destiny* (1831). The merit of these tales, which are characterised by genial wit, a quick sense of the ludicrous, and considerable ability in the delineation of national peculiarities, is sufficiently proved by the fact that by some Scott was credited with the authorship. Miss Ferrier enjoyed the esteem and friendship of Sir Walter, who repeatedly gave expression to his appreciation of her talents, praised her portraits of society, and called her his 'sister-shadow,' and derived consolation from her sympathy in the season of gloom which darkened the close of his life. She figures in Lockhart's *Life of Scott*, and amongst her papers was found an article, 'Recollections of Visits to Ashiestiel and Abbotsford,' published, along with a Memoir, in Bentley's edition of her works (6 vols. 1881). She died at Edinburgh, November 5, 1854.

**Ferro**, or **HIERRO**, the most western of the Canary Islands (q.v.). This island was selected as a first meridian by a scientific congress called together at Paris by Richelieu in 1630. The meridian chosen, 20° W. of Paris, and 17° 39' W. of Greenwich, is not, however, that of the west coast of Ferro, which really lies 20° 1' 43" W. of Paris. Nevertheless it has been universally agreed to regard it as lying exactly on the 20th meridian W. of Paris. This first meridian is still used by some European nations. See LATITUDE AND LONGITUDE.

**Ferrocyanogen**, a compound radical supposed by chemists to exist in ferrocyanic acid and the ferrocyanides. It cannot exist in the free state. The most important of the ferrocyanides is the potassium salt; it is prepared in the following manner. A mixture of potassium carbonate, iron filings, and animal matter, such as dried blood, horn clippings, &c., is heated to redness in iron pots. Potassium cyanide is thus formed. The mass is extracted with water, the cyanide combines with iron, forming ferrocyanide, which dissolves, and may be purified by recrystallisation. The chief use of potassium ferrocyanide is for the preparation of Prussian blue—ferric ferrocyanide (see DYEING and CALICO-PRINTING)—which is formed on the

addition of a ferric salt to solution of the ferrocyanide. A ferrous salt produces a white or light-blue precipitate of ferrous ferrocyanide. By the action of dilute sulphuric acid on potassium ferrocyanide, prussic acid is produced; if strong sulphuric acid be used, the ferrocyanide is completely decomposed, yielding carbonic oxide gas, and sulphates of iron, potassium, and ammonium. Hydrochloric acid causes the separation of ferrocyanic acid,  $H_4Fe(CN)_6$ , in small white crystals insoluble in hydrochloric acid. Most of the metallic ferrocyanides are insoluble, and many have characteristic colours. Iron cannot be detected in either ferro- or ferricyanides by any of the common reactions. Potassium ferrocyanide is not poisonous. The chemistry of these compounds is not yet thoroughly understood.

**Ferrol**, a Spanish seaport in Galicia, stands on a narrow arm of the sea, 11 miles by water and 33 by rail NE. of Corunna. A poor fishing-town until 1752, it now is one of the strongest fortified places in the kingdom, and possesses one of its three largest arsenals (with dockyards, naval workshops, &c.), while the annual trade reaches about £500,000. The harbour is safe and capacious, and has a very narrow entrance, defended by two forts. The town has manufactures of naval stores, linen, cotton, and leather, and exports corn, brandy, vinegar, and fish. The inhabitants (23,969 in 1884) are engaged principally in the arsenal and in the sardine fishery. In 1805 a French fleet was defeated by the English off Ferrol. The town was taken by the French in 1809 and 1823, and in 1872 was the scene of a republican rising.

**Ferrottype**, or **ENERGIATYPE**, a photographic process, first made public by Robert Hunt in 1844, in which the negative was developed by a saturated solution of protosulphate of iron, with mucilage of gum-arabic, and fixed by soaking in water to which a small quantity of ammonia or hyposulphite of soda had been added.

**Ferry**, a passage by boat across water. Common rowing-boats are generally used for ferrying foot-passengers, but when horses and carriages have to be taken across, a flat-bottomed barge, with an inclined plane at one end, to rest upon the shore, for landing and embarking, is generally used. This may also be rowed across, but is usually drawn by a cable. The rope stretched across the river passes through rings or over pulleys attached to the barge, and the ferrymen move the barge across by pulling the rope. The rope restrains the barge from drifting in the direction of the stream. With a small boat this difficulty is obviated by the ferryman rowing obliquely, as though he were steering for a point higher up the river. Rafts are sometimes used for ferrying; and steam ferry-boats of various kinds and sizes are familiar to everybody.

*Flying-bridge* is the name given to a kind of ferry-boat which is moved across a river by the action of the combined forces of the stream, and the resistance of a long rope or chain made fast to a fixed buoy in the middle of the river. The boat thus attached is made to take an oblique position by means of the rudder; the stream then acting against the side tends to move it in a direction at right angles to its length, while the rope exerts a force in the direction towards the buoy. The course of the boat is analogous to the path of a rising kite. The holder of the kite corresponds to the buoy, the wind to the tidal stream, and the tail to the rudder. Flying-bridges may be used for military purposes. In the case of a wide river the rope or chain requires to be of considerable length, and must be supported by movable buoys or by small boats. Such flying-bridges are familiar to

those who have sailed up the Rhine. In some cases, instead of an anchor laid in the stream, two shears or masts are erected, one on each bank, and firmly secured by guys. A stout hawser is then stretched tight from the top of one mast to the top of the other. There is a large iron ring or 'grummet,' to which is fastened one end of the boat rope, the other end being made fast to the boat or boats of which the bridge is composed.

**Ferry, JULES FRANÇOIS CAMILLE**, French statesman, born at Saint Dié in the Vosges, April 5, 1832, was admitted to the Paris bar in 1854, and speedily identified himself with the opponents of the Empire. His hostility was carried into journalism, and a series of articles in the *Temps*, in which he analysed the accounts of the prefect who was then rebuilding Paris, were republished as the *Comptes Fantastiques d'Hausmann* (1865). In 1869 he was elected to the Corps Législatif, where he voted against the war with Prussia; and during the siege of Paris by the Germans (1870-71) he played a prominent part as central mayor of the city. He was minister to Athens in 1872-73, and in 1879 became minister of Public Instruction, in which capacity he brought forward an education bill containing a clause, which was levelled at the Jesuits, shutting out members of 'unauthorised religious communities' from the schools. The clause was twice thrown out in the senate, but the expulsion of the Jesuits was effected by decrees founded on laws long since fallen into disuse, and brought about the dissolution of the ministry in September 1880. M. Ferry then formed a cabinet, which remained in office until November 1881; and he again became premier in February 1883, when he boldly embarked on a policy of 'colonial expansion,' involving a war in Madagascar, and a costly and unsatisfactory invasion of Tonquin, where a disaster to the French troops abruptly brought about his downfall in March 1885.

**Fertilisation** is that essential process of sexual reproduction in which the male element (spermatozoid, antherozoid, pollen-tube) comes into contact and more or less complete union with the female element or ovum (see REPRODUCTION), and through which the subsequent division and differentiation of the ovum becomes effectively possible (see EMBRYOLOGY). The term is, however, often more loosely employed to denote those preliminary processes by which the male fertilising element is brought into conditions for beginning fertilisation proper. Hence, while the zoologist speaks commonly of the fertilisation of the ovum, but of the fecundation of the female animal, the botanist, in speaking of the fertilisation of the flower, is referring to the wind or insect agencies by which the pollen is brought to the stigma, and of the details of floral structure and mechanism adapted to these, the term fecundation thus being more frequently applied to the subsequent and essential process. See FLOWERS.

**Fesa**, or **FASA**, a town of Persia, in the province of Fars, about 60 miles SE. of Shiraz, with a population of 18,000. It has manufactures of silken fabrics, and some trade in tobacco.

**Fescennine Verses**, one of the oldest forms of popular poetry in Italy, consisted of dialogues in rude extempore verses, generally in Saturnian measure, in which the parties rallied and ridiculed one another. The making of them formed a favourite amusement of the country-people on festive occasions, especially at the conclusion of harvest and at weddings. But, degenerating into extreme license, the practice had at last to be regulated by law. The Fescennine verses are usually considered to derive their name from the Etrurian town Fescennium.

**Fesch, JOSEPH**, Cardinal and Archbishop of Lyons, was born 3d January 1763, at Ajaccio. Of Swiss parentage, he was the half-brother of Letizia Ramolino, the mother of Napoleon Bonaparte. During the French Revolution he became commissary to the Army of the Alps under his nephew in Italy. The First Consul having resolved on the restoration of the Catholic worship, Fesch resumed the clerical habit—for he had originally taken holy orders—and was active in bringing about the concordat with Pope Pius VII. in 1801. He was now (1802) raised to be Archbishop of Lyons, and in the following year to be cardinal. In 1804 he was sent as French ambassador to Rome, where he ingratiated himself with the pope by his adroit management and ultramontane sentiments. Two years later he was appointed associate and successor of Dalberg, Prince Primate of the Confederation of the Rhine. At a national conference of clergy assembled at Paris in 1810 he gave utterance to views which lost him the favour of Napoleon, who was still further exasperated against him on account of a letter which Fesch wrote to the pope, then (1812) in captivity at Fontainebleau, and which was intercepted. After this he lived in a sort of banishment at Lyons. At the approach of the Austrians in 1814 he fled to Rome, where he spent nearly the whole of the rest of his life. His resistance to the will of his nephew, and indeed his whole conduct, seems to have been actuated by sincere zeal for what he considered to be the interests of the church. He died at Rome, 13th May 1839. Of his large collection of paintings he bequeathed a part to the city of Lyons; the rest were sold at Rome after his death.

**Fescue** (*Festuca*), a large and widely diffused genus of grasses, very nearly allied to Bromegrass (q.v.), and including many of the most valuable pasture and fodder grasses—e.g. Meadow Fescue (*F. elatior*, var. *pratensis*), with the allied Tall Fescue (var. *arundinacea*), Sheep's Fescue (*F. ovina*), of which as many as eight varieties are enumerated, but of which, besides the common form, (var. *vulgaris*) only Hard Fescue (var. *duriuscula*) is of agricultural importance. Red Fescue (*F. rubra*) has also the important varieties, creeping (var. *genuina*), tufted (var. *fullaw*), various-leaved (var. *heterophylla*), and violet (var. *violacea*). See GRASSES, and PASTURE; and Stebler's *Best Fodder Plants* (Lond. 1889).

**Fess**, one of the heraldic ordinaries. See HERALDRY.

**Festiniog**, a village of Merionethshire, North Wales, 22 miles by rail WNW. of Bala, and 3½ S. of Blaenau-Festiniog. Standing amid waterfalls and mountains (the loftiest Moelwyn, 2529 feet), it is a great tourist centre. Blaenau-Festiniog, 27 miles SSW. of Llandudno Junction, and 13 NE. of Port Madoc by the 'Toy Railway' (1869), is a town of recent growth, inhabited chiefly by slate-quarrymen. Pop. of parish (1851) 3460; (1881) 11,274.

**Festivals**, or **FEASTS**, a term denoting certain periodically recurring days and seasons set aside by a community for rest from the ordinary labour of life, and more or less hallowed by religious solemnities. These may be joyful occasions commemorating the lives of heroes, or general days of humiliation for disasters. But even when sorrow was to be expressed the mortification of the body did not always suffice, but plays, songs, dances, and processions full of boisterous mirth were resorted to—as in the festivals of Isis at Busiris, of Mars at Papremis, in the Adonia of Egypt, Phœnicia, and Greece—because the divine wrath or sorrow was, like that of man, to be changed into satisfaction. Festivals have also helped onward the progress of

civilisation itself. Besides helping to knit together into unity the body politic, they stimulated the artistic sense to emulation in music and the dramatic art, and thus laid the foundations of the greatest æsthetic triumphs. Enthusiastic, wild, metaphysical Egypt invested the countless days consecrated to her deified stars, plants, animals, and ideas, to the Nile, to Ammon, Kneph, Menes, Osiris, to Horus, to Neitha, to Ptah, with a mystery, sensuality, and mournfulness always exaggerated, sometimes monstrous. The Hindu, no longer daring to offer human sacrifices, shows his odd and cruel materialism by throwing into the waves, on his festival of rivers, some of his costliest goods, gold, jewels, garments, and instruments; while in the licentiousness and debaucheries perpetrated on the festival of Siva, the god of procreation, or on the Bacchanties of the goddess Bhavani, he exceeds even those of the Egyptians on their Neitha feasts at Bubastis, and the Greek worship of Aphrodite in her Cyprian groves.

The ancient Persians alone of all nations had no festivals, as they had no temples and no common worship. These 'Puritans of Polytheism,' who worshipped the sun only, and his representative on earth, fire, scorned show and pomp and large religious gatherings. A striking contrast to them is formed, in another hemisphere, by the ancient Mexicans, who were found to possess one of the most richly developed calendars of festivals, scientifically divided into movable and immovable feasts. As a strange and singular phenomenon among festivals we may also mention here that 'of the Dead' or 'of Souls,' celebrated among the wild tribes of North America. At a certain time all the graves are emptied, and the remains of the bodies buried since the last festival are taken out by the relatives, and thrown together into a large common mound, amid great rejoicings and solemnities, to which all the neighbouring tribes are invited.

Greece had received the types of civilisation, religion, and art from Egypt and the East, but she developed them all in a manner befitting her glorious eline and the joyous genius of her sons. At the time of the *Iliad* two principal festivals only—the harvest and the vintage—seem to have been celebrated (ix. 230); but they soon increased to a very large number. The religious part of the festival—homage offered to personified ideas—consisted mostly in the carrying about of the deity of the day to the sound of flute, lyre, and hymn, and in a sacrifice, followed by a general meal upon certain portions of the animal offered. Then followed scenic representations symbolising the deeds of the gods; after which came games and matches of all kinds—foot, horse, and chariot races, leaping, boxing, throwing, and wrestling. Separate accounts are given of some of the more remarkable Greek festivals under BACCHUS, MYSTERIES, and PANATHENÆA, and of the 'Holy Games' proper, the Olympian, the Pythian, the Nemean, and the Isthmian, under these heads. As all these festivities were provided out of the public purse the individual did not suffer more than a welcome interruption of his usual business, and under that genial sky the penalty to be paid for occasional indolence was not too heavy.

Rome adopted and acclimatised the foreign deities as she went on from conquest to conquest, exactly as, with her usual prudence and practical sense, she conferred her right of citizenship on the nations subjected to her rule. Her yoke was thus less galling to the new provinces, while at the same time the populace at home found sufficient distraction in the many ancient and newly imported festivals, with their quaint rites and gorgeous pageantry. Yet the Romans never exceeded in their festivals a hundred in a year, and in these, again, a

distinct line was drawn between civil and religious ones. Some of the principal religious festivals were the *Sementina*, on the 25th of January—the rural festival of the seed-time; the *Lupercalia*, in honour of Pan; the *Cerealia*; the night festival of the Bona Dea; the *Matronalia*; and the *Minervalia*. To the purely civil ones belong the *Januaria*, the 1st of January and the New-year's Day, when the new consuls entered upon their office, and friends used to send presents (*strenæ*) to each other; the *Quirinalia*, in memory of Romulus, deified under the name of Quirinus; and the *Saturnalia*, in remembrance of the golden age of Saturn, beginning on the 19th of December. The celebration of these festivals was in all respects imitated from the Greeks, with this difference only, that the games connected with them became with the pre-eminently bellicose Romans terribly lifelike images of war. Their sea-fights; their pitched battles between horse and foot, between wild beasts and men; their so-called Trojan games, executed by the flower of the nobility; their boxing-matches (with gloves that had lead and iron sewed into them); circus, arena, and amphitheatre, gave, especially in later times, the greater satisfaction the greater the number of victims.

With the first and strictest monotheists, the Hebrews, the remembrance of their liberation from Egypt, and the momentous period of preparation in the desert which followed it, mingled with almost all their religious observances, and especially their festivals, and infused into them all a tone of deep and fervent gratitude; while at the same time it held ever before their eyes the cause of their nationality, and their aim and destiny 'to be a kingdom of priests and a holy people.' The Hebrew festivals, too, are of an historical, agricultural, astronomical, and political nature; but they mostly combine all these characteristics, and are always hallowed by the same religious idea. Connected with their festivals were no plays and no representations of a god's deeds, no games and no cruelty, no mystery and no sensuality, but the sacrifice of the day, and a special occupation with the divine law. The influence of the number Seven (q.v.) is seen in the recurrence of many of the Jewish solemnities. The Sabbath, the first and most important of these septenary festivals, is treated of under its own head. The most exalted of new-moon festivals was that of the first day of the seventh month, 'the day of remembrance of the sounding' or 'of trumpets' (Lev. xxiii. 24), to which in later times, when the Seleucidæ era was introduced, the name of *Rosh hashana* (New Year) was given; notwithstanding that in Exodus (xii. 2) Nisan is spoken of as the first month of the year. After a period of six years of labour the earth, too, was to celebrate a Sabbath-year; what it produced spontaneously belonged to the poor, the stranger, and to animals. After a revolution of seven times seven years the year of Jubilee or *Jobel* was to be celebrated, in which all the Hebrew slaves were set free, and all land which had been sold in the interval was restored to the former owners, in order that the original equilibrium in the families and tribes should be maintained intact. The pre-eminently agronomical and historical festivals were the three *Chaggim*—viz. Pesach (Passover, q.v.), Schabmoth (Feast of Weeks), and Succoth (Feast of Tabernacles), on which three every male was obliged to go up to Jerusalem and offer some of the first fruits, besides the prescribed sacrifices. Post-Mosaic and exclusively historical were the feasts of Purim, of Haman, and of the Maccabees.

Only a cursory glance can be here taken of the Christian festivals, which are treated separately under their various names. They were for the

most part grafted, in the course of time, upon the Jewish and Pagan ones, but always with a distinct reference to Christ and other holy personages. The weekly day of rest was transferred from Saturday to Sunday, and called the Day of Joy or Resurrection. For a long time both Saturday and Sunday were celebrated, especially in the East. Two separate celebrations took the place of the Jewish Passover: the *Pascha Staurosion* was the festival of the Death, the *Pascha Anastasion* of the Resurrection of our Lord (see **EASTER**); and the festival of Pentecost, or the law-giving at Sinai, became the festival of the outpouring of the Holy Ghost and of the inauguration of the New Covenant.

In the course of the 4th century two new festivals were introduced: Epiphany (q.v.), which originated in the East; and that of the Nativity or Christmas (q.v.). Circumcision, Corpus Christi, the festivals of the Cross, of the Transfiguration, of the Trinity, and many others are of still later date. The veneration felt for Mary as the 'Mother of God' found its expression likewise in the consecration of many days to her special service and worship; such as that of her Presentation, Annunciation (Lady Day), Assumption, Visitation, Immaculate Conception (q.v.), and many minor festivals, over and above the month of May and the Saturdays, which in some parts were entirely dedicated to her, in order that the Mother might have her weekly day like the Son. Besides these, there were festivals of Angels, of Apostles, Saints, Martyrs (on the supposed anniversary of their death, called their birthday, *dies natalis*), of Souls, Ordinations, &c. Some were of special importance owing to special circumstances; thus St Patrick's Day (March 17th) is especially sacred to Irishmen, St Andrew's Day (November 30th) to Scotchmen, and St George's Day (April 23d) to Englishmen. In the United States we find corresponding festivals in Washington's Birthday (February 22d), Independence Day (July 4th), Decoration Day (q.v.; observed in 1889 as a legal holiday in twenty-two states), and Thanksgiving Day (usually the last Thursday of November).

Celebrated at first with all the primitive simplicity of genuine piety, most of the church's festivals were ere long involved with such pomp and splendour that they surpassed those of the ancient Greeks and Romans. Burlesque, even coarse and profane representations, processions, mysteries, and night-sorceries were in some places, although unauthorised by the general church, connected with them, and voices within the church loudly denounced these 'pagan practices.' Ordinances forbidding unmoderate music and female singers for divine service were issued, the vigils were transformed into fasts, days of abstinence and penance were instituted, partly as counterpoises, but with little result. Nor did the prodigions increase of these festive occasions, and the rigour with which abstinence from labour was enforced in most cases, fail to produce the natural results of indolence and licentiousness among the large mass of the people. But it was only after the most decided and threatening demands, as by the German Diet of Nuremberg in 1522, that Pope Urban VIII. was prevailed upon to reduce the number for Catholic Christianity (1642). Benedict XIV. (1742) and Clement XIV. (1773) followed in the same direction.

The Christian festivals have been divided variously into *ferie statuta* (returning annually at fixed times), *indicta* (extraordinary, specially proclaimed), *duplicita* (double reminiscence, or of higher importance), *semiduplicita* (half double), &c. It was long the custom to recite the office of the Ferie in addition to that of any feast chancing to fall on it. Hence, on the more important

solemnities, a *double* office had to be recited, one of the *ferie*, another of the feast. *Semi-doubles* were those in which the two offices were made into one. The church celebrates certain festivals till the *octave* or eighth day after they fall due. Another division is into weekly and yearly feasts, these latter being subdivided into greater and minor, or into movable and immovable. There is also a distinction made between *integri* (whole days), *intercisi* (half-days), &c.

The only trace of the ancient manner of dating a festival from the eve or vesper of the previous day—a practice discontinued since the 12th century, when the old Roman way of counting the day from midnight to midnight was reintroduced—survives in the 'ringing in' of certain days of special solemnity on the night before, and in the fasts of the vigils.

Some of the principal Mohammedan festivals (see **MOHAMMEDANISM**) are partly based upon those of the Jews and Christians, such as the weekly Friday (the Jewish Day of Atonement); others are the Birthday of the Prophet, that of Hussein, of Mohammed's granddaughter Zeynab, of the Night of the Prophet's Ascension to Heaven, and Bairam (q.v.). See **HOLIDAY**.

See **BREVARY**, and works on this subject by Buxtorf, Lightfoot, De Wette, Jaumgarten, Mai; also Thomassin, *Traité des Fêtes*; Gavartus, with Morati's Notes; and Probst, *Brevier u. Brevier-gebet*.

**Festoon**, in Architecture, a sculptured wreath of flowers, fruit, leaves, &c., frequently used as an ornament in Roman and Renaissance buildings. Like many of the other ornaments of classic architecture, it owes its origin to one of the sacrificial

Festoon:  
St Mark's Library, Venice.

emblems—viz. the flowers with which the heads of the animals, the altars, &c. used to be decorated.

**Festus**, PORCIUS, Roman procurator of Judæa, who succeeded Felix (q.v.), 60 A.D., and died a few years afterwards. In 62 Paul defended himself before him. See **AETS**, xxv.

**Festus**, SEXTUS POMPEIUS, a Latin grammarian, who flourished most probably in the 2d century A.D., and is one of our most important authorities on the Latin language. His epitome of the great work (now lost) of Verrinus Flaccus, *De Verborum Significatione*, was arranged alphabetically in twenty books, of which only the latter half (M—V) survives, and even that in a single deplorably mutilated MS. This came from Illyria, and fell into the hands of Pomponius Lætus, a distinguished scholar of the 15th century. It ultimately passed into the library of Cardinal Farnese at Parma, and is now preserved at Naples. The work, in spite of all its imperfections, is a grand storehouse of knowledge on points of mythology, grammar, and antiquities. We have, too, a meagre abstract of Festus's abstract, compiled by a priest Paulus in Charlemagne's time. All previous editions of Festus are of little value compared with that of K. O. Müller (1839), in which he has made use of the Farnese MS. and other sources, distinguishing the value of each.

**Fetch**. See **DOUBLE**.

**Fetichism**, the worship of a fetich, or more strictly the belief that the possession of a thing can procure the services of a spirit lodged within it. The fetich is an object capable of being appropriated by an individual, and counted as animate and conscious. We find fetichism flourishing not only in Africa, but among the natives of both Americas, the Polynicians, Australians, and Siberians, and indeed in the lower strata of all known civilisations. The word itself is ultimately due to the Portuguese, the first Europeans to trade on the west coast of Africa, who expressed their conception of the religion of the natives by the Portuguese word *feitição*, 'magic,' but it received its currency through the medium of the French, the well-known treatise of Charles de Brosses, *Du Culte des Dieux Fétiches* (Dijon, 1760), having carried the word over Europe. Comte used it as a term to describe what he believed to be a necessary stage in the development of all religions in which all external bodies, natural or artificial, are supposed to be animated by souls essentially analogous to our own. Sir John Lubbock's definition of fetichism is closer to its modern scientific sense—'that stage of religious thought in which man supposes he can force the deities to comply with his desires.' He makes it the next stage in the ascent of religion from pure atheism through totemism and shamanism into idolatry. But it is impossible to admit this transition from fetichism to idolatry, because the latter necessarily implies the superiority of the god over the man; the former, on the contrary, the superiority of the man over the god. Idolatry is properly the worship paid to an image which is taken to be the usual or merely temporary abode of a superhuman personality. Mr Tylor's definition—'the doctrine of spirits embodied in, or attached to, or conveying influence through certain material objects'—includes the meaning, but is not expressed with his usual exactness and point.

Fetichism may be said to be *primitive* when man, personifying everything around him, chooses among these imaginary personalities an object capable of being appropriated to himself, the spirit of which becomes his protector or his slave. Again, that may be called *secondary* fetichism which implies belief in the incorporation of a spirit in some object chosen as a fetich, either by a simple act of spontaneous choice or through a magical operation. The latter is far more widespread than the former, and obviously presupposes a belief in animism in Mr Tylor's sense of the word. Any object may become a fetich, provided only it is capable of being appropriated literally or metaphorically by an individual. Such objects are flints, shells, claws, feathers, earth, salt, plants, manufactured articles, anything peculiar or unknown or not understood, trees, streams, rocks, and even certain animals, as the serpents of Whydah. All savage thinking is of course based on fancied analogies, and it is quite enough for an object to be accidentally associated with an event for it to be regarded as the cause and even the author of that event, whence its elevation to the rank of a fetich. Again, fetiches are attached to individuals, to families, or to tribes, and it is even not unusual to see them beaten and kicked as a warning when they have failed to bring the luck that was expected. Even in the crooked sixpences which we carry in our purses, and in the luck-tokens of our gamblers, there is something more than an analogy to the fetich of the savage.

**Fétis**, FRANÇOIS JOSEPH, Belgian musician, also critic and historian of music, was born at Mons on 25th March 1784. His first app was that of organist and professor of music at Douai (1813). He then held successively the post of professor of counterpoint and fugue at the Paris Conservatory (1821), and that of director of the Brussels Conservatory (1833), combining with this last the office of musical director to the king of the Belgians. He died at Brussels, 25th March 1871. He wrote a considerable quantity of music, including operas and sacred music; but he is principally noticed for his works on the theory of music—*Traité de l'Accompagnement de la Partition* (1829), *Treatise on the Theory and Practice of Harmony* (1844), and *Treatise on Counterpoint and Fugue* (1824). But even more valuable than these are his *Universal Biography of Musicians* (1835-44; 2d ed. 1860-65), and *General History of Music* (1869-76). These books, although not free from careless errors, especially in chronology, and although marred by the writer's bias and partiality, are nevertheless of great value to the historian of music.

**Fetwa**, the decision of a Turkish Mufti (q.v.) given in writing.

**Fen** and **Fen-duty**, in Scots law. A fen may be described as a right to the use and enjoyment of lands, houses, or other heritable subjects, in perpetuity, in consideration of an annual payment in money, grain, cattle, or services, called *fen-duty*, and certain other contingent burdens called casualties of superiority (see CASUALTIES). Though the term fen was used by feudalists to express any relation of superior and vassal, in Scots law it was opposed to ward or military holding, and to blench or nominal holding. A fen, in short, was a perpetual lease—a fen-farm, as it was often called—by which the tenant became bound to pay a substantial consideration, and his rights under which he might forfeit as the penalty of non-payment. In the present day the disposal of land in fen is practically a sale for a stipulated annual payment, equivalent to chief rent. The system of feuing property for building purposes has several advantages over that of the long building-leases common in England. From its perpetual character it gives to the holder a greater interest in the property, and usually leads him to erect more enduring structures than he would do under a lease. For as time runs on the fen often increases in value, while the reverse must always be the case with the interest of the tenant in leasehold property. Hence the movement for leasehold enfranchisement in England, which is scarcely intelligible in Scotland. Neither does feuing interfere with the letting of property on lease or otherwise. Almost all the houses in Edinburgh and the other towns of Scotland which are let, either on leases or from year to year, are held by their proprietors in fen. Modern fen-duties are in general paid in money. When the stipulation is for a duty in grain the quantity is valued by fair prices (see FIARS), and paid in money accordingly. Since 1874 the fen-duty, whether of money or grain, must be of fixed amount—i.e. not contingent. The original deed transferring the land in fen from the superior to the vassal is called a feucharter or feu-contract, which is now a very simple and intelligible document. Registration has now the effect of sasine in making the vassal's right real; and, unless otherwise stipulated, the vassal is now perfectly free to transfer his property to any one without fine or composition, what were called 'charters by progress' having been abolished.

Usually the feu-charter reserves to the superior all minerals in the ground, and stipulates that the vassal shall build his house either in a particular style or of a certain value. By the Scottish statute 1597, chap. 246, it is declared that all vassals by feu-farm failing to pay their feu-duty for two years together shall lose their right; but the superior is bound to accept payment of arrears before declaring an 'irritancy'—i.e. forfeiture. For the most part, land proprietors near towns and manufacturing villages are anxious to add to their annual rental by feuing grounds for building purposes. The rate of feu varies widely, from as low as £8 to as high as £500 per acre per annum; a common rate is from £20 to £40 per acre. Whatever be the amount, it is payable by the four—not the tenant to whom the fennar may have let the property. When a building consists of several floors forming distinct dwellings, the feu-duty is allocated in certain proportions among the respective proprietors; the feu to whom the lower floor belongs usually paying most. In properties of this kind each is responsible only for his own share. In the same way, when a property is sold subject to a *cumulo* feu-duty, it is necessary, with the consent of the superior, to allocate this feu-duty on the different portions of the subject. Occasionally feudalties are offered for sale; and, as a safe investment, bring from twenty-five to thirty years' purchase. In such cases the vassal has an opportunity of extinguishing his feudal tenure, and becoming the superior. It is not unusual in feuing building-lands for the superior to make the roads and drains, the vassals being, of course, bound to contribute relatively to the first expense, or at least the subsequent maintenance of both. In large centres of population the feu-contract is largely superseded by the contract of ground-annual.

**Feud** in the middle ages meant a war waged by private individuals, families, or clans against one another on their own account. See VENDETTA.

**Feudalism.** The feudal system formed in mediæval Europe the connecting link which united the primitive society, whose basis was entirely personal, with the modern reign of law and order. It may be described as a great military and social organisation based on the holding of land, yet containing, imbedded within itself, like fossils in the rocks, the relics of the earlier systems which in each different country had preceded it. The result of the system was the establishment of the various great European powers on the ruins of the Roman empire, and the preservation of order and discipline in the wild times of the disintegration of that empire. For a clear understanding of the feudal system, how it came to be introduced, and the changes it wrought, a glance is necessary at the social systems which preceded it, and which can for this purpose be classed under two leading types, the Teutonic and the Roman, known respectively as the Mark system and Emphyteusis. The industry of Stubbs, Seebohm, and others has thrown a flood of light on the working of the mark system in the primeval German forests, by which we can almost accurately reproduce the primitive society and trace its growth.

In the first century the tribes seem to have been purely nomadic, each kept together under the control of its head, having cattle and other belongings, but no idea of permanent possession of the land, or, indeed, of anything more than taking the pasture and fruits of the earth for the time being, and defending their temporary encampment as long as they remained there. Each chief had his personal following, called by the Romans *comitatus*, composed principally of the younger

sons of the chief families, and of men who preferred a life of adventure to peaceable cattle-feeding. The chief's council was composed of the heads of the chief families. In many of the larger tribes there were subordinate divisions, presided over by inferior chiefs, but the organisation, whether of the whole or of an individual part, was the same. Probably originally every man was free and equal, but by degrees a class rose up composed partly of prisoners taken in war and kept as slaves, partly of gamblers who, having lost all else, staked their freedom, and lost that; others, again, from mere poverty, might voluntarily surrender their freedom for subsistence, and thus a class of unfree men would gradually spring up. By degrees these nomadic tribes took to settling and cultivating the land, the influence of increasing wealth and civilisation and the knowledge of agriculture, derived from their Roman neighbours, tending largely to promote this result; but still the same broad principles obtained. A group of families would settle on an unoccupied tract of land, and the council of the heads would assign to each family a spot to build a homestead, and to put up cattle-sheds and stackyards; all the rest of the land they occupied in common. A fertile glade was chosen for a common meadow, and to each family the council allotted a share proportionate to its numbers. Each family cut and harvested its own hay, then the fences were thrown down, and the meadow became common pasture till the grass began to grow again next spring. Around the village and the meadow were the woods and wastes, always common, never divided or inclosed; these were called the 'mark,' a word meaning a boundary, and which yet lingers in the Scotch and Welsh Marches, and whence came the name of the Province of Mercia.

The next step in civilisation was the knowledge of tillage, and as arable ground could not well be re-allotted every year, a portion large or small came by degrees to be attached to each homestead, and not included in the yearly subdivision. Still, however, there was no ownership of land as we understand it. The head of each family was a member of the community, a freeman and a political unit, and in that capacity had a homestead assigned to him; this homestead was the outward badge or sign of his status as a freeman. This village was called the mark, a group of marks formed a district, called by Roman writers 'Pagus,' and by English writers a Hundred. The pagus elected a chief, who was a kind of local judge, and each pagus sent representatives to the national assembly, in whom the central power was vested. In war each pagus sent a hundred champions to the host, the nucleus of which was the chief of the tribe with his *comitatus*. Thus the host was simply the nation in arms, arranged according to the same divisions as in peace; and when a country was conquered they had merely to settle down in the order they stood, and recommence their mark life in a new place. The position of a Teutonic land-owner, then, was that he held his land not of any superior, but in token of his status as a freeman and head of a household; and on his death the assembly of the markmen would confer the homestead on the man on whom that headship devolved, which also, to some extent, they had the power of regulating. Such a system was it that in the fifth century the Saxons, Angles, and Jutes introduced into England; and its traces, notwithstanding the lapse of fourteen centuries, may still be found in village greens and many of the rights of common, whenever the latter are not manorial. Large grants of land were made to distinguished warriors of the *comitatus*, who settled down with their dependents and slaves, forming villages on their lands in analogy to the mark. The whole country was now

looked upon as one great mark, the unallotted lands forming a sort of treasury out of which grants could be made to new-comers by the great council. Theoretically, the possession of land still was the badge of a freeman; yet, as these grants of land were alienable, and could be sold, a class of landless men gradually arose, and as these had no visible sign of their status it became the rule that every landless man must commend himself to some land-owner who should be responsible to the state for him. Also, the smaller land-owners would often commend themselves to some powerful lord for the sake of honour and protection. A second stage in the progress of social organisation was thus reached; the purely personal basis was no longer the sole foundation of society, the land-owner, not the freeman, became the unit; the host was the body of land-owners in arms; but still it was open to the landless man to select his own lord, and such selection created no indissoluble tie; besides this, the freeman was still in political theory the equal of the noble, and thus the personal basis, though obscured, was not entirely lost sight of.

In the meantime developments somewhat corresponding to these were taking place in the Roman empire; long or perpetual leases of lands taken in war were granted by the state in the tenure called *Emphyteusis*. About the time of Constantine this tenure was also adopted by private persons and corporations, and was extended from land to houses, the person to whom the grant was made being called *Emphyteuta*. It may be defined as a grant of land or houses for ever or for a long period on the condition that an annual sum (*canon*) shall be paid to the owner or his successors, and, if not paid, the grant shall be forfeited. The *emphyteuta* is not legal owner, nor a mere hirer; but the agreement is determined by the *Lex Zenoniana* to rest neither on letting nor on selling, but to be a peculiar contract depending on agreements of its own. The *emphyteuta* had the usufruct of the land, was entitled to its fruits, and under certain restrictions could alienate his possession, which on his death passed to his heirs; but the ownership remained with the *dominus-emphyteusos* or lord, and the *emphyteuta* was bound to pay the agreed rent, to manage the property as a good *paterfamilias*, and to pay all the burdens and deliver the receipts to the lord. A good account of this tenure may be found in Hunter's *Roman Law*, pages 426-429. In the later empire, by a modification of this tenure, the frontier lands on the Rhine and Danube were granted to chiefs of the German tribes on condition of their being always ready to defend the integrity of the empire, this service being taken in lieu of the canon or rent of the ordinary *emphyteusis*. Thus the rival systems of the German mark and the Roman *emphyteusis* were brought into direct juxtaposition, and when the barbarians, who for so long had hung 'poised on the edge of the empire,' broke into the Roman world, carrying their ideas of social organisation with them, it was natural that the grants of conquered lands to great warriors should be made on terms analogous to *emphyteusis* rather than (as happened in the earlier conquest of Britain) on the older mark system. These grants were called *beneficia*, the *beneficium* being held on condition of the performance of certain services, of which the most important was naturally military. As in England also, so on the Continent the weaker and poorer would commend themselves to some powerful lord, surrendering their allodial lands (i.e. those held in absolute ownership) to him, to be received back in a sort of *emphyteusis* tenure on condition of the performance of military service. Hence arose feudalism. Littré makes the Low Lat. *feudum* of Teutonic origin, and thus cognate with Old High German *fhū*, Gothic *faihu*,

A.S. *feoh* (our *fee*), mod. Ger. *vieh*, cattle being originally the only wealth. It came subsequently to mean property of any kind, including land, the second part of the root being taken from the word *od*, also meaning property or pay; thus *fee-od*, *feodum*, or *feudum* means property held on condition of pay or services rendered. Guizot in *Civil France*, iv. 41, says: 'The word (feudalism) appeared for the first time in a charter of Charles the Fat in 884.'

So now the third stage of progress was reached, when land became the sole basis of society, the sacramental tie of all public relations; the poor man depended on the rich, not as his chosen patron, but as the owner of the land he cultivated, the lord of the court to which he did suit and service, the leader whom he was bound to follow in the field (see Stubbs, i. 167). The feudal theory was that the king was the sole allodial or absolute owner of all the land in the kingdom; the chief lords held their lands from him on condition of military service; their vassals from them on similar conditions; and sub-vassals from them again, and so on in an infinite chain; each vassal owing fealty to his own immediate lord, but being bound by no tie whatever to the lord's lord. Such was the leading principle of the system which prevailed over France and Germany at the time of the Norman Conquest, which was introduced into England by William the Conqueror and his Normans, and engrafted on the Saxon mark system, but modified by the genius of William I. to suit his own theories of statesmanship. It was introduced about the same period into Scotland by various adventurous Norman knights, and engrafted on the older clan system with such modifications as suited their purpose. Thus three distinct types of feudalism arose with marked differences, as we shall see. The disruptive tendency of the continental feudalism is obvious; the system was there pushed to its logical conclusion. Thus, for instance, the Duke of Brittany was vassal of the king of France, and owed him fealty, as did the vassals of the duke to him, but between the king and the vassals of the duke there was no tie whatever. When therefore the duke chose to throw off his allegiance and rebel against the king, his vassals were bound by their feudal obligations to support him. Such a system could only result in making France a mere congeries of powerful barons bound by slight ties to a nominal head. The weakness of the Carolingian kings and the early Capets largely conduced to this, as did also the degeneracy of the people, who seem to have forgotten that they ever had rights, and who became the ready tools and subservient slaves of the ambitious nobles. In Germany, though the disintegrating tendency was equally marked, the social development was different, owing to the sturdy independence of the German people making it necessary for any chief who aimed at independent power and throwing off the yoke of the central authority to identify himself with the nationality and the aspirations of his vassals. In this way the Guelphs became practically independent lords of the vast fiefs in Swabia, and many another great chief threw off his feudal allegiance, and Germany became a collection of confederacies, the feudal lord of each being representative of the race of his vassals, as well as supreme land-owner.

William I. in introducing feudalism into England had no intention of becoming himself a mere *roi-faineant*; he intended to be king of all England, lord of the lowest as well as the highest, not mere feudal lord of a number of practically independent chiefs. In this policy of course he had to face the opposition of his chief followers, whose object was to carve out large lordships for themselves, rendering a nominal homage to William, but practically independent of him. William's policy showed a

grasp of the principles of statesmanship rarely equalled; being obliged to reward his chief followers handsomely, he soon saw that it would be dangerous not to make large grants of land, and equally dangerous to make such grants as would enable them to set up independent kingdoms. The plan he took was to make extensive grants, but to scatter them through various counties. For instance, his half-brother Odo of Bayeux got 439 manors, but they were scattered through 17 counties; Robert of Mortain had 793 manors scattered through 20 counties. Thus, had either of these been minded to rebel, no coherence or union was possible among vassals so scattered, and in each county an attempt to collect forces for rebellion would have resulted in a collision with a powerful sheriff at the head of his *fyrd* (the army of the shire), who, being a continuation of the Saxon and popular system of government, and being royal officers entirely, might be trusted to curb the lawless barons. This, however, was not all. No sooner was William I. firmly seated on the throne, and the Domesday survey completed, than in 1086 at Salisbury he took a step which was in direct violation of the elementary feudal principles; for he summoned a great meeting to which we are told there came 'all his witan and all the land-owners of substance in England, whose vassals soever they were, and they all submitted to him and became his men, and swore oaths of allegiance to him that they would be *faithful to him against all others*.' Thus there was provided a direct tie between the king and all the freeholders which no intermediate tie would justify them in breaking.

We may now consider the nature of the services on condition of which land was feudally held, promising that in English nomenclature the man who held land was called a *tenant*, the land holden was his *tenement*, and the conditions of holding his *tenure*. Tenures, then, were of three kinds, answering to the three chief classes of the community, viz. free, unfree or baso, and religious; and each of these might be for certain services—i.e. a fixed amount of money or labour at fixed periods—or uncertain—i.e. such amounts and at such times as the lord might require. For example, the free and uncertain tenure, usually considered the noblest of all the tenures, was on condition of following the lord when he went to battle (which might of course be every year, or not at all for a number of years), with a body of men and for a number of days in the year accurately proportioned to the size and value of the holding; this was called Tenure in Chivalry or by Knight Service. The free and certain tenure was the payment of a fixed sum of money, or sometimes the performance of some service of a peaceful and usually agricultural nature, and this was termed Free and Common Socage. The base tenures were those which depended originally on the performance of menial offices, and were in fact the tenures by which serfs allowed to squat on the lords' land held their little patches at the will of the lord; a modernised and greatly modified form of this tenure still exists in England under the name of Copyhold (q.v.). The religious tenures, under which in early times all the church lands were held, were known as Frankalmoin and tenuro by Divine Service, the theory being that the prayers of holy men were all they could be called on to give by way of service to men, and the difference between the two being simply that in the former the number and times of the prayers was left to the conscience of the tenant, in the latter a certain number of masses was laid down, and if they were not duly said the lord had his remedy by distress; this last tenure became obsolete at the Reformation. Frankalmoin or free alms is still the tenure whereby in England

the parson holds the church and glebe, the nearest thing to allodial ownership known in England. The necessity, especially in military tenures, of knowing accurately who the tenant was, gave rise to a number of so called 'incidents of tenure.' Thus, on death of a tenant, the custom of the particular manor, which was pretty much the same all over the country, pointed out who by descent became his rightful successor; if the heir was a minor, another incident gave the lord the wardship of his person and lands till his majority; if a female, the lord might dispose of her hand in marriage, lest she should marry a hereditary enemy; if the tenant wished to sell his land, the lord must accept the new-comer as his tenant; and if the tenant died altogether without heirs, the land escheated to the lord. Accordingly, the lord might always know who his tenant was, and where to look for his services.

In England, though the oath at Salisbury to a large extent took the sting out of feudalism and minimised its disruptive effect, all these results and incidents developed themselves with great luxuriance and symmetry; but in or about the time of Henry II. a custom arose of commutting all the services for money to be spent in pay of mercenary soldiers, and thus another blow was dealt at the personal relationship based on land-holding which was of the essence of the feudal system. Later still, in the reign of Edward I., was passed the famous statute known as *Quia Emptores* (18 Ed. I. chap. 1), prohibiting any vassal from granting any land to be held in fee-simple under himself, and enacting that if he wished to sell it he must do so out and out, so that the purchaser thenceforth should hold of the same chief lord as the seller had held of before. Thus the formation of the infinite chain of lord, vassal, and sub-vassal was checked, till in process of time it has come about that nearly all freeholders in England hold directly from the crown. About the same time in France the influence of powerful kings began to absorb the semi-independent dukes and princes into the crown, but not till the following century was the result finally achieved by Louis XI. He broke the feudal power of the great Duke of Brittany, the last, as he was the most powerful of the feudatories of the crown. In this way French feudalism became a thing of the past by the absorption of all the mesne lords, finally bringing about the same end which William I. accomplished by masterly policy in England; but bringing it about by dint of the sacrifice of all the great nobles, and reducing France to the condition of a powerful king with a weak and servile people, a state of things necessarily leading to the greatest tyranny and to revolution and upheaval. Meantime in England the progress was steady and certain. *Quia Emptores* destroyed the disruptive force of feudalism; but the old military tenures remained in name, though in fact they were little more than excuses whereby the lord contrived to screw money out of the unlucky tenant in the guise of fines for alienation, reliefs on taking up the inheritance by the heir, heriots, first-fruits, prime seisms, &c. There were also the aids given by the tenant at certain expensive epochs of his lord's life, viz. when he was taken prisoner and required ransom, when his eldest son was dubbed a knight, and when his daughter was married—*pur ransomner son corps, pur faire filz chevalier, et pur marier sa fille*. The extortion to which the feudal system finally degenerated, when all its original purposes was gone, was put an end to by the Statute abolishing Military Tenures, passed on the restoration of Charles II.; and from that time forward feudalism to all intents and purposes was dead in England, save only so far as it affected the forms of conveyance of land. A few

of the old tenures were preserved, probably on account of their picturesque quality and of their being too light to be any real burden, such as the tenures of grand and petit serjeanty, under the latter of which the Dukes of Marlborough and Wellington held their lands on condition of the presentation of a flag to the sovereign.

We have seen how in France the disruptive nature of the feudal system and its tendency to create a class of petty sovereigns more powerful than their feudal lord proved the destruction of the system itself in that country in the 15th century; and how the very introduction of it into England was marked by a violation of one of its essential features, so that feudalism in its integrity never existed in England. But probably the country where the system can be most advantageously studied in its development and decay is Scotland; into this country it was introduced not by a powerful monarch like William I., but by a number of restless and ambitious Norman knights journeying north in search of adventure, who by their good swords and their Norman talent for organisation made themselves chiefs of powerful clans. The process by which this was accomplished and its general good effect on the country have been well shown by the Duke of Argyll in *Scotland as It Was and as It Is* (2 vols. 1887). From these Norman knights the great houses of Bruce, Stewart, Fraser, Grant, Comyn, and many others take their rise; but the poverty of the country and the sparseness of population, constantly reduced by devastating wars, prevented the aggrandisement of the feudal lords, and checked the disruptive tendency of the system just sufficiently to preserve its vitality to a comparatively modern period. Indeed, in the rebellion of 1745, it became evident that sufficient of the feudal spirit remained to be a source of danger to any government which chanced to be unpopular with the Highland chieftains, and also sufficient of its disruptive and disintegrating tendencies to render any enterprise depending on their support extremely precarious. Accordingly, after the suppression of that rebellion, the military tenures were abolished by legislation very similar to that which at the Restoration had abolished them in England. Nothing analogous to the oath at Salisbury ever took place in Scotland; accordingly the development of the system which made every chieftain a king in miniature, whose little realm was a sort of microcosm of the whole kingdom, proceeded unchecked. No statute analogous to *Quia Emptores* ever prevented subinfeudation, and accordingly to this day there may be any number of links in the chain of superior and vassal and sub-vassal; while in England, since no sub-vassal could be created after 18 Edward I., the intermediate lords have for the most part gradually dropped out, and most land-owners now hold directly from the crown, which was one result aimed at by William I., resulting in the most complete consolidation of the country.

Those who wish to see the remains of the feudal system in visible, albeit dead and fossilised form, may do so more completely on the banks of the Rhine than almost anywhere else. The castle of the feudal baron towers on its height; the village of his dependents nestles at its foot, with the church whose priest was his tenant in frankalmoin, or maybe his chaplain; the pier, it may be, which paid his dues—in fact, all the machinery of a tiny kingdom. Between one baron and another there might be friendship; there was more often feud. Over a number of the barons was some feudal lord, a prince-bishop perhaps, or a duke, and over them again the king; and in legend and story as well as in visible remains of the ancient buildings may be traced all the ramifications of the system, till the

eye of fancy can without much difficulty reconstruct it again.

See Hallam's *Middle Ages* (1818); Stubbs, *The Constitutional History of England* (1874-78); Seebohm, *The English Village Community* (1883); Guizot, *Histoire de la Civilisation en France* (1845); Waitz, *Deutsche Verfassungsgeschichte* (1843-78; new ed. 1879-86).

**Feu de Joie**, or 'running-fire,' a discharge of musketry into the air, by a line of soldiers, in honour of a victory or other great occasion. It commences with the right-hand man of the line, and passes rapidly down it, each man discharging his rifle after a short but regular interval, till the extreme left of the line is reached.

**Feuerbach, Ludwig Andreas**, German philosopher, fourth son of the following, was born at Landsbut, 28th July 1804. After he had studied theology for two years at Heidelberg under Paulus and Daub, Hegel attracted him to Berlin, and ere long he abandoned theology for philosophy. In 1828 he became *privatdocent* at Erlangen, but failed as a lecturer, and next retired to Bruckberg, where his wife's means enabled him to live in studious quiet for more than twenty years. In 1830 he published anonymously his *Gedanken über Tod und Unsterblichkeit*—an attack on the doctrine of immortality—and during the next few years, works on the philosophers between Bacon and Spinoza, on Leibnitz, and Pierre Bayle. But these historical works only paved the way to a critical investigation into the nature of religion and its relation to philosophy, the results of which have been given to the world in several works well known to speculative theologians. The most celebrated of these is his famous work on the nature of Christianity, *Das Wesen des Christenthums* (1841), which had the honour of translation into English from the pen of Marian Evans (George Eliot). Starting from the Hegelian doctrine that the Absolute comes to consciousness only in humanity, Feuerbach denies to it any existence beyond the human consciousness, maintaining it to be merely the projection by man of his own ideal into the objective world, on which he feels his dependence. All authority above man, and consequently all moral obligation, is therefore consistently regarded as a delusion proceeding from man himself, and the highest good is explained as that which is on the whole most pleasurable. Yet even this highest good is further explained as consisting in resemblance to that ideal humanity which man creates for himself, and worships as God. A kind of ideal theism is therefore retained by Feuerbach; but when his doctrines were adopted by the mass of German communists, they degenerated, perhaps logically, into an actual atheism, which ignored any moral or social law imposed on the individual from any other source than himself. The last years of the philosopher were vexed with poverty and paralysis, from which he was relieved by the offerings of admirers, and at last by death, 13th September 1872. His works were collected, with additions and corrections to bring them into accordance with his later views, in ten volumes (1846-66). See the books on Feuerbach by Ludwig Grün (1874), Beyer (1872), and Starcke (1885).

**Feuerbach, Paul Johann Anselm von**, one of the most distinguished criminal jurists of Germany, was born at Jena, 14th November 1775. From the gymnasium at Frankfurt-on-Main, where his father was an advocate, he passed in 1792 to Jena to study first philosophy, then law. Already he had made a brilliant reputation by his *Kritik des natürlichen Rechts* (1796), and his *Anti-Hobbes* (1798), when he began to deliver lectures which introduced into criminal jurisprudence a new method of treatment, systematised in his *Lehr-*

*buch des gemeinen peinlichen Rechts* (1801; 14th ed. 1847). This celebrated work placed Feuerbach at the head of a new school of jurists, who maintain that the decision of the judge in every case ought to be determined solely by an express delivrance of the penal law, never by his own discretion, and who on that account obtained the name of Illogorists. It gave a powerful impetus to the feeling in favour of more humane and less vindictive punishments. In 1801 he was appointed professor in Jena, but in 1802 accepted a call to Kiel. In 1804 he removed to Landslüt; but next year he was transferred to an official post in Munich, and in 1808 was appointed privy-councillor. The new penal code which he planned for Bavaria (1813) was taken as a basis in the emendation of the criminal law of several other countries. During this period also he published his *Merkwürdige Kriminalrechtsfälle* (1808-11). In his *Geschworenengericht* (1813) he maintained that the verdict of a jury is not necessarily adequate legal proof of a crime. Supplements were published in 1819 and 1821, and a second volume was added in 1825. In 1814 Feuerbach became second president of the Court of Appeal in Bamberg, and afterwards first president of the Court of Appeal at Anspach. In 1832 he published a work on Kaspar Hauser (q.v.). He had just edited a collection of his *Kleine Schriften* when he died suddenly at Frankfurt-on-Main, 25th May 1833. An interesting life was written by his son Ludwig (2 vols. 1852).

**Feuillans**, CONGREGATION OF, a reform of the Cistercian order, remarkable as forming part of the great religious movement in the Roman Catholic Church during the 16th century, contemporary with and probably stimulated by the progress of the Reformation. The author of this reform was Jean de la Barrière, abbot of the Cistercian monastery at Feuillans in Languedoc (20 miles south-west of Toulouse), who, painfully struck by the relaxation of its discipline, laid down for himself a new and much more austere course of life, in which he soon found many imitators and associates among the brethren of his order. The rule thus reformed was, after considerable opposition from the advocates of the old rule, approved, with certain modifications, by Pope Sixtus V., the reformed congregation, however, being still left subject to the authority of the abbot of Cîteaux; and a convent was founded for them by Henry III. in the Rue St Honoré, Paris. The subjection to the abbot of Cîteaux was removed by Pope Clement VIII. in 1595; and Urban VIII. in 1630 separated the congregation into two branches, one for France and the other for Italy, each under a distinct general. The rules of both these branches were subsequently modified about the middle of the same century.

The celebrated revolutionary club of the Feuillants took its name from this order, whose convent in the Rue St Honoré was its meeting-place. It was founded in 1790 by Lafayette, Sieyès, Laroche-foucauld, and others holding moderate opinions, but it soon fell before the devouring fire of revolution. At length, on the 28th March 1791, the assembly in the cloister was forcibly dispersed by a raging mob. In October 1791 the extreme right and the right in the Legislative Assembly were often called Feuillants.

**Feuillet**, OCTAVE, a distinguished French novelist, born at Saint-Lô, in La Manche, 11th August 1812. He was numbered for some time in the band of Dumas' literary assistants, and began his own literary career with *Le Fruit défendu*, in the *Revue Nouvelle*. From 1848 he published in the *Revue des Deux Mondes* a series of

proverbs, comedies, tales, and romances, which were collected in *Scènes et Proverbes* and *Scènes et Comédies* (5 vols. 1853-56). He was elected to fill Eugène Sciebe's chair at the French Academy in 1862, and was afterwards librarian to the emperor. Some of the earlier novels, as the pathetic story *La Petite Comtesse*, gave promise of power, but his popularity as a novelist really awoke with the publication of the masterpiece *Le Roman d'un Jeune Homme Pauvre* (1858), and the only less beautiful *Sibylle* (1862). These were followed by *M. de Camors* (1867), *Julien de Tréceur* (1872), *Un Mariage dans le Monde* (1875), *Les Amours de Philippe* (1877), *Le Journal d'une Femme* (1878), *Histoire d'une Parisienne* (1881), and the striking *La Morte* (1886). He has written many successful comedies, but it remains true that his dramatic faculty is more effectively displayed in his novels than in his work for the stage. Feuillet has many excellent gifts as a writer of fiction. His stories are cleverly constructed, gracefully told, and unstained by coarseness; he is thoroughly acquainted with the high circles in which his characters move; he has pathos and even passion at his command. Yet he cannot be classed as a great novelist. He has never created a really strong character; he frequently strikes a false note; he indulges in morbid sentimentalism, and has a weakness for treating dubious situations while posing as a strict moral teacher. These defects are in the main unapparent in *Le Roman d'un Jeune Homme Pauvre*, but the story, though interesting and in parts charming, yet fails to leave a powerful impression on the reader.

**Feuilleton** (Fr., lit. 'a small leaf'), the name applied to that portion of a political newspaper set apart for intelligence of a non-political character, for criticisms on art or literature, or for fiction, and usually separated from the main sheet by a line. The feuilleton was first adopted in 1800 by the Abbé Geoffroy for dramatic criticisms in the *Journal des Débats*, but by degrees the element of belles-lettres became dominant, and the result was a species of light journalistic literature, in which Jules Janin became the acknowledged king. In the years immediately preceding the revolution of February 1848 entire romances were spun out in the feuilleton, as the novels of Eugène Sue in the *Constitutionnel*. Among the later French *feuilletonistes* may be named Fr. Sarcy, P. de Saint-Victor, Alb. Wolff, Jul. Claretie, and A. Scholl. The French system has been imitated in Germany, though with less success than in France, but has hitherto found less favour in England. The more eminent of recent German *feuilletonistes* are K. Frenzel, P. Lindau, L. Pictsch, F. Gross, O. Bauck, and the humorists, Eckstein, Stettenheim, Trojan, and Dohm.

**Feval**, PAUL HENRI CORENTIN, a French novelist, born at Rennes, September 27, 1817. Of his many bright and vigorous novels may be named *Les Mystères de Londres* (1844), *Le Fils du Diable* (1847), and *Le Bossu* (1858). Many of his romances have had an extraordinary run when dramatised. Feval became converted to the strictest Roman Catholicism in 1876.

**Fever** (Lat. *febris*, lit. 'a trembling'), a diseased condition of the system, of which the most important characteristic is a rise in the temperature of the body. Fever should be regarded as fundamentally a symptom or group of symptoms, rather than as a disease or class of diseases, for the causes leading to it are extremely various; but it is a symptom of such importance that the term is used, with a distinguishing epithet, as the name of a number of diseases. The increase of the temperature of the body requires to be estimated according

to the state of the internal parts rather than the external; the surface of the body, and particularly the extremities, being not unfrequently cold rather than warm. In many cases where fever occurs, most characteristically in *Ague* (q.v.), it may be considered as passing through three distinct stages more or less marked: (1) the cold or shivering stage; (2) the hot stage; (3) the sweating stage. This description, however, requires to be qualified by the remark that, even in the cold stage of fevers, it is now well ascertained that the blood and the internal organs have an elevated temperature, as estimated by the thermometer introduced into the cavities of the body. In the cold stage of fever, accordingly, and even in the most violent *ague*, when the teeth are chattering with cold, and the whole surface is pale and clammy, the state of the system is well expressed by the maxim of Virchow, to the effect that 'the outer parts freeze while the inner burn.' The increase of temperature is very various in different diseases and at different times in the same case. When it is over 104° F. it may be regarded as 'high;' when over 106° it is often called *hyperpyrexia*; and when it exceeds 107° for more than an hour or two a fatal issue is almost certain.

Elevation of temperature, though perhaps the most important, is by no means the only indication of the feverish state. It is often ushered in by a chill, or a distinct shivering, or *rigor*, as it is technically called; this leads through the cold stage to the hot, which usually follows pretty rapidly, and is attended by all the febrile phenomena in their highest degree. The pulse, and usually the breathing, are quickened; the appetite is lost or impaired, and the tongue furred; there is thirst, often excessive; headache and pains in the back and limbs are often present, with restlessness and general uneasiness; there is great weakness of the muscular system; all the secretions are disordered, the urine in particular being scanty, high-coloured, and loaded with sediment; when the fever is severe, delirium often comes on, especially at night. If the feverish state continue, rapid wasting takes place, especially affecting the fat and the muscles. If the case take a favourable turn, the feverish state terminates either gradually, by *lysis*, as in typhoid fever, or suddenly, by *crisis*, as in typhus fever and acute inflammation of the lungs. In the latter case there is often what is called a 'critical discharge' from skin, kidneys, or bowels. (For the features of special feverish diseases, see under their respective titles.)

The cause of the increased temperature in fever is not yet fully understood. Increased oxidation takes place in the body in almost all cases where fever is present, and must be associated with increased evolution of heat; but calculation seems to show that this is not sufficient to account in many cases for the high temperature maintained. Whether the other factors concerned depend upon obscure chemical changes in the body, or upon some peculiar disorder of the nervous system, is at present only a subject of inquiry and speculation.

Diseases in which fever occurs are separated pretty naturally into two great groups: in one of these the fever is the greatly predominating fact, and determines the specific character of the disease, the local disease (if present) being quite subordinate, and usually secondary in point of time; in the other the opposite order prevails, and the fever is obviously secondary. Hence the distinction embodied in medical language between *idiopathic* (i.e. 'self-originating,' 'spontaneous') and *symptomatic* or secondary fevers. The idiopathic fevers are distinguished with reference to their mode of diffusion, as *Epidemic* (q.v.) and *Endemic* (q.v.); or with reference to their supposed cause,

as contagious, infectious, malarious, &c.; or with reference to their incidental symptoms and their peculiarities of course and termination (the presumed *specific* phenomena attracting, of course, particular attention), as *eruptive* (see *EXANTHEMATA*) or *non-eruptive*, malignant, &c. See also *DISEASES* (CLASSIFICATION OF).

Among these distinctions, based upon the course of the fever, one demands particular notice, as involving an important law of febrile diseases generally, and of a large class of fevers of warm climates in particular. Periodic increase and diminution, or paroxysms of longer or shorter duration, with intervals of more or less perfect relief from all the symptoms, are characteristic of most diseases of this kind, but especially of those arising from *malaria*—i.e. emanations from the soil, educed under the influence of solar heat. The duration of the paroxysms and of the intervals, the complete *intermission*, or more partial *remission*, of symptoms, become in such cases the characteristic facts that mark the *type*, as it is called, of the fever, which is accordingly distinguished as *intermittent* or *remittent*, and, according to the length of the periods, *tertian*, *quartan*, *quotidian*, &c. See *AGUE*.

Symptomatic or secondary fever occurs in a large number of diseases. Indeed, there is no condition which rules so large a part of the physician's duty, whether in the way of distinguishing diseases or of curing them, as this constitutional state. It is specially associated with acute or sub-acute inflammations of the various organs and tissues of the body. Among the diseases where it is usually most marked some of the most important are acute rheumatism, or rheumatic fever; acute abscess; meningitis, often called brain fever; acute pneumonia, or inflammation of the lungs; peritonitis.

Hectic is only distinguished from other forms of fever by the comparative mildness of its symptoms, and its slow and insidious progress. It is specially characteristic of Consumption (q.v.) and allied diseases, and of chronic forms of blood-poisoning.

The treatment of the feverish state depends so much on the cause which produces it that it can hardly be profitably treated in a general way. Some remarks, however, on the methods in use for reducing the temperature of the body may not be out of place. In very many cases of fever no such treatment is necessary; but when the temperature is so high, or so long above the normal, as to be in itself a source of danger to the patient, special means must be adopted for its reduction. Quinine has long been in use for this purpose in many diseases besides *ague* and other malarial fevers, in which it is the remedy *par excellence*. But within the last few years several new drugs have been brought into use, which have the property of reducing feverish temperature in most cases, and appear to be of great value. Of these antipyrin and antifebrin, both derivatives of coal-tar, have found most favour. Ice-bags, or coils of metal tubing through which cold water is kept flowing, are sometimes applied to the surface of the body, particularly to the neighbourhood of an organ on inflammation of which the fever depends. But the most powerful and certain of all methods, the only one hitherto found effectual in certain forms of 'hyperpyrexia,' is the use of a cold wet pack, or a bath at a temperature below that of the body. Such measures, it need hardly be said, require much caution and judgment in their application, but they have been found of great value in various forms of disease.

**Feverfew** (*Matricaria*—*Pyrethrum*—*parthenium*), a composite perennial, common in hedgebanks and waste places, but in Britain usually as a garden escape. It is closely allied to camomile, and still more to wild camomile (see *CAMOMILE*),

and like these is of immemorial use in medicine as a tonic and bitter, its popular name recording its febrifugal properties. Like many other popular medicines, it has now been replaced by more potent remedies, save occasionally in the domestic practice of country districts, or in that of the herbalist. A double variety is not uncommon in gardens. The Mayweed (*M. inodora*), with leaves more resembling those of chamomile, but almost scentless, and large flowers with white ray and yellow disc, is common in cornfields and waste places in Britain and throughout Europe. See PYRETHRUM.

Common Feverfew  
(*Matricaria parthenium*).

**Feverwort** (*Triosteum perfoliatum*), a perennial of the order

Caprifoliaceæ, a native of North America, where its dried and roasted berries have been occasionally used as a substitute for coffee; its roots act as an emetic and mild cathartic. It is sometimes called *Tinkar's Root*, from the physician who first brought it into notice.

**Feydeau**, ERNEST, a French novelist, born in 1821, whose stories depict the worst features of society in the time of the Empire. Despite the morbid tone and low morality of his works, he had unquestionable talents, and produced one novel, *Sylvie*, of much more than ordinary power. Among his other works are *Fanny Sornin*, *Le Roman d'une Jeune Mariée*, *Amours Tragiques*, *Catherine Overmaire*, *Le Secret du Bonheur*. Feydeau died in 1873.

**Fez**, or more properly FAZ, the second capital of the sultanate of Morocco, lies inland in 34° 6' N. lat. and 4° 58' W. long., about 100 miles E. of Rabat on the Atlantic. Standing in a pear-shaped valley surrounded with hills, which are clothed with orchards of orange, pomegranate, apple, and apricot trees, and with olive-gardens, whilst the plain is strewn with numerous minor buildings, Fez presents a strikingly oriental appearance. The town itself, divided into two parts by a little stream that joins the Sebou 2½ miles to the NE. of the town, is encircled by crumbling walls, and has narrow, dirty, sunless streets. For more than a thousand years Fez has been one of the sacred cities of Islam, being especially renowned for its university and schools of learning. The university, attached to the mosque of the Cherbini, called also the mosque of Muley Edris (one of the largest and most venerated in North Africa), was founded in 859; at present it is frequented by about 700 pupils, who come from all parts of the Mohammedan world, and are taught by about forty professors. Attached to this mosque is a library, computed to contain 30,000 MSS. Besides the university there are also fourteen colleges. The extensive palace of the sultan is now partly in ruins. Although thus falling into decay, Fez is nevertheless one of the busiest commercial towns of north-west Africa; its merchants import European manufactured wares and the productions of tropical lands, which they despatch by periodical caravans to Timbuktu and the interior of Africa, and export (since 1885 very largely by way of Rabat, instead of as formerly by Tangier) the products they receive thence in

return, such as fruits, gums, ivory, gold, together with those of the native industries, chief amongst which are morocco leather, fez caps, pottery, and gold and silver wares. The population is very variously estimated from 150,000 to 50,000; a native computation in 1888 puts it at only 24,000, embracing Arabs, Berbers, Jews, and Negroes. Fez was founded by Muley Edris in 808, and was the capital of the Edrisi dynasty as long as it lasted. Towards the end of the 11th century the town was made the capital of an independent kingdom, founded (1086) by the Almoravid prince, Yussuf ibn Tashfin, and from that time onwards it ranked, on account both of the veneration it was held in as a sacred city and of its learning, as one of the first cities of Islam. But from the date of its incorporation with Morocco, in 1548, it began to decay in importance. See Delphin, *L'Enseignement Supérieur Musulmain* (1889), and De la Martinière, *Morocco* (Eng. trans. 1889).

**Fez**, a red, brimless cap of fine wool, fitting closely to the head, with a tassel of black or blue, worn in Turkey, Persia, Greece, Albania, Egypt, and on the shores of the Levant generally. The name is derived from the town of Fez, where such caps were first made; at present the best are manufactured in Tunis, but fozes of fair quality are prepared in Germany, France, and Switzerland. In Africa they are usually called *turbish*.

**Fezzan**, a province of the Turkish empire, politically attached to Tripoli, to the south of which country it lies. Extending some 300 miles N. and S., and some 300 E. and W., between 24° and 29° N. lat. and 12° and 18° E. long., Fezzan belongs to the desert region of North Africa. It consists of a huge depression, fenced in on all sides except the west by low ranges of hills, and traversed by barren, stony, shelterless plateaus, between which lie long shallow valleys, containing numerous fertile oases. The northern barrier of the province is the range of Jebel es-Soda, which strikes off nearly due east from the south-east corner of the Saharan plateau called the Hammada el-Homra, and is continued towards the south-east by the Hamjel-Aswad. The Jebel es-Soda measures about 125 miles in length, and has an average altitude of 2950 feet. South of this range stretches for some 80 miles a series of low elevations, strewn with smooth stones, destitute of water, and almost entirely devoid of plant and animal life; beyond these again comes a region of sandy alluvial soil, containing saline deposits, with a tolerably good supply of water at 10 to 12 feet below the surface. South of the Hammada el-Homra Fezzan is invaded by the *edeyen* or Saharan sand-dunes; and these are separated from the Hammada of Murzuk on the south by the Wady Ladshal, a watercourse extending north-east for about 125 miles. The southern border of the province is formed by the Tümmu Hills, more than 2500 feet high, which connect the Ahaggar plateau in the north-west with the mountainous region of Tehesti in the south-east. The entire region slopes gently towards the east.

The oases, mostly depressions in the valleys, are the only cultivated spots, where a little grain and a few vegetables are raised, and where grows the date-palm, the principal source of food for the inhabitants and their domestic animals. Of these camels, poultry, and pigeons are alone kept in any great number. The climate is on the whole uniform and healthy, although malarial fever is very frequent. Fezzan is both hotter in summer and colder in winter than Tripoli; its temperature ranges from 23° to 112°, the annual mean being 70° F. The atmosphere is very dry; rain scarcely ever falls. The principal winds blow from the

south and east, but from December to April north and west winds are very prevalent. There is no industry, no export trade except in soda, obtained from extensive salt lakes north west of Murzuk, and very little commerce. Formerly, however, the Fezzan merchants occupied a very important position as intermediaries in the trade between Tripoli and Egypt with Bornu and Timbuktu; but the opening of new routes and the attempts to check the trade in slaves—the great staple of this route—have destroyed the commercial importance of Fezzan. The inhabitants, estimated by Nachtigal at about 50,000, are a mixed race, embracing Tuareg, Tibbu, Bornu, Haussa, and Arab elements grafted on the original nomadic stock. They are frivolous, pleasure-loving, and idle, but noted for their honesty and good-nature, as well as notorious for their immorality. In their manners and social customs they have borrowed largely from Arab originals; in religion they are Mohammedans of the Sunnite creed. The principal town of the province is Murzuk, a place of about 6500 inhabitants.

Fezzan is the ancient Phazania, or the land of the Garamantes, whose capital was Garama, and who were conquered by the Roman Balbus in 20 B.C. In the middle of the 7th century the country was invaded and subdued by a lieutenant of 'Amr ibn al-Asi, the Moslem conqueror of Egypt. From the 10th century onwards, with the exception of about 100 years (the 13th century), when it was held by the kings of Kanem from the south, Fezzan was ruled by native or Arab dynasties. From the 16th century its history may be epitomised as a series of struggles against Tripoli, until in 1842 it finally lost its independence, and became a Turkish province and part of the governor-generalship of Tripoli; but it has now a separate governor, who acts almost wholly independently of the governor-general of Tripoli. See Barth, *Travels in Central Africa* (vol. i. Lond. 1857), and Nachtigal, *Sahara and Sudan* (vol. i. Berlin, 1879).

**Fiars** (a word of controverted origin, probably connected with the French *affourage*, 'taxation,' but possibly with *fiar*, 'the holder of a fee,' as originally confined to crown vassals). The *fiars* prices in Scotland are the prices of the different kinds of grain of the growth of each county for the preceding crop, as fixed by the sentence of the sheriff, proceeding on the report of a jury summoned for the purpose, before whom the evidence of farmers and corn-dealers is produced. The values thus officially ascertained serve as a rule for ascertaining the prices of grain in all contracts where they are not fixed by the parties; and in many sales it is agreed to accept the rates fixed by the fiars. The original use was to fix crown rents, and it was long ere the system was applied to church stipends. See **TEINDS**.

The form of procedure in 'striking the fiars,' as it is called, is regulated by Act of Sederunt, 21st December 1723, renewed 29th February 1728, which is itself of doubtful legality. The time fixed by this act for summoning the jury is between the 4th and 20th of February, and the verdict must be returned before 1st March, old style; which is generally considered too early, as before that time not much grain of the previous crop has been brought into the market. Later dates were afterwards fixed for Orkney and Shetland. Mr Barclay, sheriff-substitute of Perthshire, in his Digest, gives the following account of this difficult and delicate process as practised in his county. 'In Perthshire, the fiars court is held on the last Friday of February, or the first Friday of March. The jury consists of eight heritors, a few farmers, and some neutral parties, especially one or two able to check the calculations. An experienced accountant is sworn,

and acts as such, but is not on the jury, and is paid a fee from the county rates. The list of the jury is shifted every alternate year, thereby giving sufficient release from duty, and yet securing persons skilled in the practice. Some years ago it was arranged to take no juror who either paid or received rents according to the fiars; but this greatly limited the choice, and was complained of, and abandoned. All considerable dealers in Perthshire victual, whether resident in Perthshire or elsewhere, are uniformly summoned, and in addition every person whose name is given in by whatever person interested. There are, however, grave differences of procedure in the different sheriff courts. In fact the Act of Sederunt was never in operation in Haddington. The result has been an artificially severe fluctuation in values. It is obvious that the method of fixing fiars requires investigation and correction; also that all grain payments should be compulsorily converted into money. The same mode is not adopted in England under the Tithe Commutation Act (see **TITHES**). See Paterson, *Historical Account of the Striking of the Fiars in Scotland* (1852); *Fiars Prices*, by William Hector; *Position of Fiars Prices and Conversion of Grain Payments*, by N. Elliot (1879). For the fiars prices prior to 1776, see Bald's Tables. See also Taylor's *Tables of Value of Tithe Rent Charges* (1879), and, for elaborate tables, the annual issue of Oliver and Boyd's *Edinburgh Almanac*.

**Fiasco**, a term borrowed from the usage of the Italian theatre, and now naturalised in France, Germany, and England, for a failure in acting or singing, or by extension of the metaphor for a failure of any kind. In Italy it is not uncommon to hear an audience cry out, 'Ohi, ohi, *fiasco*,' even when the singer has only made a single false note. The word means literally 'a bottle,' and its metaphorical use may contain an allusion to the bursting of a bottle.

**Fiat**, in English law, a short order or warrant of a judge or public officer for making out or allowing processes, letters-patent, &c.

**Fiber**. See **MUSQUASH**.

**Fibres**, **TEXTILE**. See **FIBROUS SUBSTANCES**.

**Fibrin** is a proteid substance which appears in the blood after it is shed, and by its appearance gives rise to the process of coagulation or clotting. Freshly prepared fibrin is a stringy, elastic, white substance. Its elementary composition is carbon, 52.6; hydrogen, 7.0; nitrogen, 17.4; sulphur, 1.2; oxygen, 21.8 = 100.0. It gives the various reactions of the proteid substances (see **PROTEIDS**). It is insoluble in water, and only slowly soluble in solutions of the neutral salts. It is precipitated by a saturated solution of sulphate of magnesium. It must therefore be considered as nearly allied to the globulin group of proteids.

Fibrin may best be obtained by whipping blood as it is shed with a bundle of twigs, which after a time become surrounded by masses of the fibrous elastic threads of fibrin. These may then be washed to free them from the various constituents of the blood. The mode of appearance may be well studied by allowing a layer of blood to coagulate on a microscopic slide under a cover glass, and then gently washing the cover glass to which the clot adheres with a stream of water. It will be seen to consist of a delicate reticulum of fibrils with granular-looking masses at many of the nodal points. The fibrils appear to have shot out from these granular masses.

The source of fibrin is a matter upon which our knowledge is at present imperfect. The most recent investigations tend to show that a substance belonging to the globulin group of proteids, and known as fibrinogen, which occurs in the blood-

plasma before coagulation, becomes precipitated as fibrin when the blood is shed. What is the cause of this precipitation we do not know. Formerly it was supposed that the white corpuscles broke down and set free a ferment which set up the change. More recently the possible connection of the third element of the blood—the blood platelets—with the process has been suggested by various pathological investigations. Apparently the granular nodal masses already described are composed of these platelets. Although the wet fibrin derived from blood appears somewhat bulky, when dried and weighed its amount is found to be very small—on an average only 0.2 per cent. See BLOOD.

**Fibrous Substances.** Such of these as are used in the arts are either of animal or vegetable origin, with the exception of Asbestos (q.v.), which is mineral. Fibres which can be spun and woven, or made into cloth or paper by a felting process, have some peculiarity of structure which fits them for such purposes. Human hair or horse-hair is not suitable for ordinary textile fabrics, because either resembles a very thin flexible rod with smooth sides, so that when an attempt is made to twist a number of them into a yarn, or form them into a felted substance, they will not hold together. Horse-hair used singly is made into cloth because it is exceptionally strong. But nearly all fibres suitable for woven or felted fabrics, such as wool, silk, cotton, or flax, have on their surface serrations or projections of some kind, or they have a proneness to twist and curl, either of which characters causes them to interlock, so that when they are spun into yarn they do not untwist again. These little prominences or projections are only seen when the fibre is highly magnified.

In addition to suitable structure, the value of a fibre for industrial purposes depends upon its strength and elasticity, and upon its capability of being bleached and dyed. Length and fineness are also considered, as well as abundance of supply.

The wool of the sheep and the shawl goat is described under WOOL and CASHMERE GOAT. See their respective heads for alpaca, mohair, fur, and silk. There are a few other animal fibres of some interest or importance, such as camel's hair, from which an excellent cloth is made, and cow-hair, which is used in considerable quantity for inferior kinds of woollen goods. A fibre of a silky nature is obtained from the byssus of a large Mediterranean bivalve shell-fish (*Perna nobilis*), which is made into shawls and gloves.

Different parts of plants yield fibres. Only dicotyledonous plants have a true bark, and from these come the most important textile fibres of vegetable origin. These generally consist of strong, fine, flexible bast fibres from the bark sheath, of which flax, hemp, reed, and jute are examples (see BAST). The most valuable of all, however—viz. cotton, consists of hairs which surround the seeds of the plant. In monocotyledonous plants, which also yield many serviceable fibres, these are commonly obtained from the fibrous portions of leaves and of leaf-stalks. More rarely they occur as hair-like fibres which form appendages to leaves or surround their base. Coir fibre is from the husk of the nut of the cocoa-nut palm.

Vegetable fibres consist essentially of Cellulose (q.v.), a substance which is not easily acted upon by chemical reagents such as affect allied bodies found in plants. This is an important property in connection with some of the manufacturing processes through which they require to pass.

Cotton, flax, hemp, jute, and coir are described under their respective heads; reed or China-grass under BOEHMERIA; and New Zealand flax (*Phormium tenax*) under FLAX. The vegetable fibres noticed in what follows, though less known than

those used in our principal textile industries, are nearly all of some importance commercially. Besides these there are quite a number of plants yielding fibres known to have valuable properties which have not, except in the countries in which they grow, received any industrial application.

**FIBRES FROM EXOGENOUS PLANTS.**—*Asclepias syriaca* (Silk Weed).—The seeds of this plant are covered with a silky down which is used for a variety of purposes, such as the stuffing of beds and for mixing with wool for certain kinds of cloth and felt. The species is a native of Syria, but is also found in North and South America, and is cultivated in some parts of Europe.

*Beaumontia grandiflora* is another plant yielding a hairy or silky fibre from the seeds. This is considered to be one of the best and strongest of the seed-hairs called 'vegetable silk.'

*Broussonetia papyrifera* (Paper Mulberry).—A fine white cloth called tapa is made in a number of the Pacific Islands by beating the bark of this tree. The bark of this and another species of *Broussonetia* is much used for making paper in Japan. Quite recently the fibrous portion of the bark of the young shoots of white mulberry (*Morus alba*) has been used as a textile material in Italy (see MULBERRY).

*Crotalaria juncea* (Sunn Hemp).—Indigenous to Southern Asia and the tropical portion of Australasia; cultivated all over India. The fibre is very suitable for cordage, considerable quantities being exported from India for this manufacture.

*Daphne longifolia*, *D. papyracea*, *D. Wallichii*.—The fibre of the bark of each of these Indian plants is used in the manufacture of paper and ropes.

*Eriophorum comosum* (*Pollinia eriopoda*) (Babar-grass, Cotton-grass).—This plant is very common in many parts of India. The down at the base of the seeds is largely used in India for making paper, ropes, and cordage.

*Hibiscus cannabinus* (Hemp-leaved hibiscus, Deccan hemp).—In the North-west Provinces, as well as in other parts of India, this small herbaceous shrub is largely cultivated for its fibre, which is sometimes used to adulterate jute. It is inferior to the latter in quality, being rather coarse and harsh, though strong. In India it is made into ropes and nets and largely into paper.

*Humulus lupulus* (Hop).—From the hop vine a useful fibre is obtained, which is turned to account for making cloth in Sweden. In England it has been made into millboard.

*Pinus sylvestris* (Pine-wood).—In recent years fibre obtained from the leaf-needles of the Scotch fir has, on the continent of Europe, been made into a blanket stuff for hospitals, flannels, and hosiery. It is usually mixed with cotton or wool. The material is believed to have medicinal properties.

*Tilia europæa* (Common Lime-tree).—The bast fibres of this tree are extensively used in Russia for mats, ropes, and other purposes.

**FIBRES FROM ENDOGENOUS PLANTS.**—*Agave americana* (Spanish aloe).—An excellent fibre is obtained from this plant, which grows in great abundance in all parts of tropical America. It has also been successfully introduced into some countries of the Old World. The fibre is made into ropes, twine, and netting, as well as into matting and imitation harecloth.

*Agave mexicana*.—A plant distinct from the last, though often confounded with it. The fibres of both are used for the same purpose. Paper was made by the ancient Mexicans from *A. mexicana* in the same way as the Egyptians made it from the papyrus.

*Agave sisalana* (Sisal hemp).—The fibre of this species, which grows in Yucatan, Mexico, and

Central America, is especially valuable for ship cables, as it has been found to resist the action of sea-water better than most other materials used for their manufacture. Sisal hemp is sent in considerable quantities to the United States, but some of it is also sent to Europe.

*Attalea funifera* (Pia-sava).—From this palm much of the cordage used on the Amazon River is made. The strong fibres used surround the young leaves. These are known in commerce as pia-sava fibre, or at least one kind of it, which is used in Europe chiefly for brushmaking. Another kind of piassava is got from *Leopoldina piassava*, also a Brazilian palm.

*Bromelia ananias* (*Ananassa sativa*) (Pine-apple).—In some places, such as the Bahamas and India, this plant is cultivated for its fruit, but in Malacca, Java, China, and some other eastern places chiefly for its fibre. Several species of bromelia yield useful fibres. The *B. pigma* of the Philippines yields the fine thread from which the costly pina cloth or pina muslin is made. *B. sylvestris*, called in Central America the *pita*, and in Mexico the *istle*, also produces an excellent fibre.

*Carludovicia palmata* (Panama screw-pine).—The unexpanded leaves yield the straw of which Panama hats, so much valued for their durability, are made.

*Caryota urens* (Kittool).—From the leaves of this Indian palm the kittool fibre, now largely used to mix with bistles in brushmaking, is obtained. Strong ropes are made of it in India.

*Copernicia cerifera* (Carnauba or Carnahuba —q.v.—palm).—A Brazilian palm remarkable for the number of useful products obtained from it. In that country the fibres of its leaves are used for ropes, mats, brooms, &c.

*Corypha australis* (Australian cabbage-palm).—The fibre obtained by splitting the leaves is made into clothing, netting, and hats.

*Macrochloa tenacissima* (Esparto-grass).—Esparto fibre is now manufactured into Paper (q.v.) on a great scale. For this purpose it is extremely well suited, being fine and strong, with a tendency to curl. Until comparatively recently much of the esparto-grass of commerce was supposed to be the *Lycopodium spartum*, an allied plant.

*Musa textilis* (Manilla hemp).—The chief use of this fibre is in ropemaking, but matting is also made from it on a considerable scale in Dundee. It is prepared from the leaf-stalks of a wild plantain growing in the Philippine Islands.

FIBRE FROM AN ACGROENOUS PLANT, *Cibotium barmetz* (Pulu fibre).—The fibre so called surrounds the stalks of the fronds (leaves) of the plant, which is a fern growing in the Sandwich Islands. This fibre, like some of those occurring as hairs on seeds, is called 'vegetable silk.' It is used in the United States and Australia for stuffing in upholstery work.

**Fibro-vascular Bundle.** See LEAF, STEM, BARK, VEGETABLE HISTOLOGY, &c.

**Fibula**, a clasp or buckle (see BROOCH, BUCKLE). For the bone so called, see LEG.

**Fichte**, JOHANN GOTTLIEB, a distinguished German philosopher, was born at Rammenau, near Bautzen, in Upper Lusatia, 19th May 1762, of a family distinguished for their simple piety, uprightness, and firmness of character. His earlier years were marked by a love of solitary musing and meditation. In 1774 he was placed at the gymnasium of Pforta, near Naumburg; and in 1780 he entered the university of Jena, where he devoted himself at first to theology, but afterwards to philosophy. During the years 1784-88 he supported himself in a precarious way as tutor in various Saxon families. Subsequently he went to Zurich in a similar capa-

city, where he first met Johanna Maria Rahm, who afterwards became his wife. Circumstances preventing their immediate union, Fichte in 1791 accepted a tutorship at Warsaw, in the house of a Polish nobleman. The situation proving disagreeable, it was thrown up, and Fichte proceeded to Königsberg, where he had an interview with Kant, of whom he had become an ardent disciple. At first he met with a rather chilling reception. With the view of establishing a better understanding, he resolved to write his 'Critique of all Revelation' (*Kritik aller Offenbarung*), published in 1792. Kant, on the work being submitted to him, praised it highly, and ultimately recommended Fichte to his own publisher, Hartung. In the meantime, however, Fichte's available means of subsistence being exhausted, he was forced to ask the loan of a small sum of money from Kant, which the latter refused. A temporary appointment as tutor in the family of the Count of Krokow, near Danzig, relieved him from immediate difficulties; and the high literary fame which rapidly followed the publication of the *Kritik* having opened to him a new career in life, he returned to Zurich in 1793, where on 22d October he married Johanna Rahm. In 1794 he was appointed to the chair of Philosophy at Jena, where he commenced to expound his system of transcendental idealism. His prelections were distinguished by singular earnestness and oratorical power, combined with the enunciation of the loftiest moral principle.

He now clearly broke away from the limitations of the Critical Philosophy of Kant, of which he had already declared, writing to Niethammer in 1793: 'My conviction is, that Kant has only indicated the truth, but neither unfolded nor proved it.' His 'Doctrine of Knowledge' (*Wissenschaftslehre*, Jena, 1795), his work on the 'Foundation of Natural Rights' (*Grundlage des Naturrechts*, 1796), and the 'Ethical System' (*System der Sittenlehre*, 1798) contain a systematic exposition of his philosophy in its earlier form, expressed in an abstract and somewhat repellent terminology which was laid aside in his later and more popular works. In 1799 an absurd accusation of atheism, fervently but fruitlessly refuted, led to his removal to Berlin, where he delivered lectures on philosophy to a select auditory. In 1800 appeared his work 'On the Vocation of Man' (*Ueber die Bestimmung des Menschen*). In 1805 he obtained the chair of Philosophy at Erlangen, with the privilege of residing at Berlin during winter. Here he delivered his celebrated lectures 'On the Nature of the Scholar' (*Ueber das Wesen des Gelehrten*, 1803-6). In 1806 appeared his 'Characteristics of the Present Age' (*Grundzüge des gegenwertigen Zeitalters*), and in the same year his 'Way to the Blessed Life, or the Doctrine of Religion' (*Anweisung zum seligen Leben oder Religionslehre*). In these works we find the highest expression of his philosophy in its mature form, divested of the earlier technicalities. In his relation to the public events of his time Fichte exhibited a high-toned and earnest patriotism. The victories of Napoleon at Auerstadt and Jena drew forth the famous 'Addresses to the German Nation' (*Reden an die Deutschen*). In these addresses, following out the leading idea of his 'Characteristics,' Fichte summoned his fellow-countrymen, in tones of spirit-stirring enthusiasm, to the duty handed down to them from past ages, of founding an empire of reason in which mind alone should assume the guidance of human affairs. With impassioned eloquence he pointed out the true means of national regeneration in a system of public education, of which he laid down the plan and delineated the chief features. His patriotic zeal was fully appreciated by the king, who on the restoration of peace requested

him to draw up a constitution for a new university in Berlin. In 1810 the university was opened, with a host of brilliant names, Fichte, Wolff, Müller, Humboldt, De Wette, Schleiermacher, Neander, Klaproth, and Savigny. By the votes of his colleagues, Fichte was unanimously elected rector. Here, as at Jena, he laboured with unremitting energy for the suppression of all those customs which he deemed barbarous in themselves, and incompatible with the true idea of a scholar. But his public career came to a premature close. In 1813 the war of independence broke out, and the hospitals of the Prussian capital were soon crowded with patients. Fichte's wife was one of the first who offered her services as a nurse. For five months she tended the sick with all the patient tenderness and devotion of her nature. At last she was seized with fever, 3d January 1814. After a fearful struggle she recovered; but her husband caught the infection, and in spite of all remedies sank under its influence, and died 27th January 1814. Of Fichte it may be said that he combines the penetration of a philosopher with the fire of a prophet and the thunder of an orator; and over all his life lies the beauty of a stainless purity. See *Fichtes Leben*, by his son (1831); and Dr William Smith's *Memoir*, prefixed to his translation of the *Popular Works* (4th ed. 1889).

The fundamental idea of the *Wissenschaftslehre* in its earlier form is that of a primitive act of consciousness; the *Ego*, or I, posits itself—it affirms itself, simply and unconditionally. But in this self-affirmation it necessarily posits a negative—a *Non-ego*—an opposite which is not itself. This activity of the *ego* is its very essence, the necessary condition of its existence. It is itself the absolutely productive, which, however, would not attain to consciousness of itself—i.e. of its infinite spontaneous activity, did it not at the same time place in contrast to itself, and as an impediment (*anstoss*) and limit to its activity, the non-ego—i.e. the objective world, or nature. The *ego*, in so far as it is determined by the non-ego, is the intelligent *ego*, and, as such, the subject of theoretical science—the science of cognition; the *ego*, on the other hand, as determining the non-ego, is the subject of practical science—the science of the will. Freedom, absolute, spontaneous activity, for its own sake, is not with Fichte, as with Kant, the condition and presupposition of moral action, but is itself the highest expression of the problem of the moral law. To realise this self-activity, however, the *ego* requires an external world of objects, in order that in them as limits it may become conscious of its own activity. Generally speaking, Fichte makes that which, from the standpoint of ordinary consciousness, we call the world merely a product of the *ego*; it exists only through the *ego*, for the *ego*, and in the *ego*. In his later and more popular writings, from 1800 onward, Fichte's transcendentalism assumes a more profoundly religious character, the centre of the system being now an *Absolute Ego*, in whose self-determination all the *Non-ego* is determined—the One Universal Being or God, of whom all finite existence is but a manifestation—the vesture of the Infinite. This transition first appears in his *Bestimmung des Menschen* ('Vocation of Man,' 1800), and is more fully developed in the *Wesen des Gelehrten* and the *Religionslehre*; and it is also set forth in a strictly scientific manner in the *Nachgelassene Werke* (1835), in which his *Speculative Logik* and his revised theory of right and morals are particularly deserving of attention.

Although Fichte never, strictly speaking, formed a school, his influence upon the subsequent development of German philosophy has been very im-

portant; and indirectly, through the writings of Thomas Carlyle, he has exercised a marked and important influence on the course of recent thought both in Great Britain and America. Fichte's doctrine of the Divine Idea of the Universe underlies Carlyle's most impressive teachings regarding human life and duty. His popular works have been translated into English by Dr William Smith; their titles are: *The Vocation of the Scholar*; *The Nature of the Scholar*; *The Vocation of Man*; *The Characteristics of the Present Age*; and *The Way to the Blessed Life, or the Doctrine of Religion* (4th ed. 1889). An American translation of the *Wissenschaftslehre* and the *Naturrecht*, by A. E. Kröger, appeared at Philadelphia in 1868-69 (reprinted London, 1889). An admirable monograph of Fichte, by Professor Adamson, forms one of the volumes of Blackwood's *Philosophical Classics* (1881).

IMMANUEL HERMANN VON FICHTE, son of the former, was born at Jena, 18th July 1797. Occupied at first as a teacher, he was appointed professor of Philosophy in Bonn in 1836, and from 1842 to 1863 held a chair in the university of Tübingen. He was embolised in 1867, and died at Stuttgart, 8th August 1879. He wrote works on speculative theology (1847), ethics (1850), anthropology (1856), psychology (1864), the immortality of the soul (1873). In philosophy he occupies the position of a mediator between an extreme monistic and an equally extreme individualistic metaphysic, between pantheism and deism, between Hegel and Herbart. The great aim of his speculations was to find a philosophic basis for the personality of God, and for his theory on this subject he proposed the term *Concrete Theism*, to distinguish it alike from the abstract theism which makes God almost an unreality—a barren aggregate of lifeless attributes—and, on the other hand, from the all-absorbing pantheism of Hegel, which swallows up the human and the divine in its own inapprehensible totality.

**Fichtelgebirge**, a mountain-system, chiefly situated in the N.E. of Bavaria, once covered with pines (*Fichte*, 'pine'), and constituting a watershed between the head-feeders of the Elbe, the Rhine, and the Danube. Roughly speaking, it forms a rhomboid, lying between Hof, Baireuth, and Eger, its intersecting axes being disposed N.E.—S.W. and N.W.—S.E. The length of each axis thus measured is about 24 miles. The main chain forms the N.W. fringe of the system, and at its S.W. extremity wheels round so as to present a N.W.—S.E. strike, the average elevation of the peaks ranging from 2700 to 3200 feet. The highest summits are Schneberg (3461 feet) and Ochsenkopf (3334). On the S.W. edge the system falls away by steep gradients; but in the opposite direction its descent is much more gradual, the hills in the N.E. averaging an altitude of 2000 to 2300 feet. In their northern extremities the Fichtelgebirge are connected by intermediate chains, on the one hand with the Erzgebirge, and on the other with the Thuringian Forest. Geologically they are composed principally of granite and primitive crystalline slates, with which are conjoined bands and intrusions of gneiss, micaceous slates, basalt, and some strata of the Tertiary age (*Oligocæn*). The climate of the region is decidedly raw and cold; snow lies on the summits as a rule from October to May. Owing to the extensive forest tracts and the moory soil, mists are of common occurrence. The only industries carried on by the inhabitants are those connected with mining (chiefly iron and stone quarries), with the exploitation of the forests, and with the manufacture of glass. Of recent years the Fichtelgebirge have come much into vogue with tourists. See the admirable handbook by Ruchdeschel (1881).

**Ficino**, MARSILIO, an illustrious philosopher of the Italian Platonic school, was born at Florence in 1433. The son of the principal physician of Cosmo de' Medici, he was appointed by that prince in 1463 president of a classical academy (founded 1440) having for its aim the diffusion of the Platonic doctrines, which Ficino held to be the basis and confirmation of the Christian system; and at his suggestion he undertook the translation of Plotinus, Iamblichus, Proclus, and Porphyry, besides a Latin but by no means literal version of Plato. On the death of Cosmo, Ficino found a no less munificent patron in this prince's grandson, Lorenzo de' Medici; and having, at the mature age of forty, decided on entering the church, he was endowed by Lorenzo with the rectorship of two churches in Florence, and a canonry in the cathedral. His theological doctrines, while undoubtedly sincere, present a strange medley of incongruous views, the natural result of his attempt to fuse the philosophy of Plato with the Christian creed. He died in 1499. His collected works were published at Basel (2 vols. fol. 1491), and consist of translations from the Greek philosophers, and original metaphysical and theological compositions, of which may be named *Theologica Platonica seu de immortalitate animorum ac aeterna felicitate*. See R. L. Poole's *Illustrations of the History of Medieval Thought in Theology* (1884).

**Fick**, AUGUST, an eminent philologist, was born at Petershagen, near Minden, 5th May 1833, studied philology under Benfey at Göttingen from 1852 to 1856, and next acted as a teacher in the gymnasium there until his appointment in 1876 to an extraordinary professorship of Comparative Philology in the university. His chief work is his great *Vergleichendes Wörterbuch der Indogermanischen Sprachen* (3d ed. 1874-75), a stupendous monument of learning, albeit its value is somewhat impaired by the over-audacity of its reconstruction of the primitive parent-speech. Other works are *Die Griechischen Personennamen* (1874), *Die ehemalige Spracheinheit der Indogermanen Europas* (1875), and *Die Homerische Ilias, in der ursprünglichen Sprachform wiederhergestellt* (vol. i. 1885).

**Fiction**, LEGAL, a supposition of law that a thing is true, which is either certainly not true, or at least is as probably false as true. Fictions have existed in all legal systems. They have served many useful purposes, by enabling individuals who by the strict letter of the law would have been excluded from obtaining redress of evils to procure that remedy by a pious fraud. There are two general maxims which regulate the application of fictions—viz. that no fiction shall be allowed to operate a wrong, and that no fiction shall be admitted which in the nature of things is impossible. The Roman form of judicial procedure abounded with fictions, by which alone, in many cases, a party aggrieved could enforce his right. Thus, an heir, unjustly disinherited, by the *querela inofficiosi testamenti* feigned that his father had been mad. A stranger in Rome who had been robbed could not in early times obtain restitution without the *fictio civilis*, whereby he feigned himself a citizen. Many of the fictions existing in Rome have found a counterpart in modern systems; thus, the *fictio longa manus*, whereby lands at a distance were feigned to be delivered, resembles an English feoffment at law. In like manner, the *fictio traditionis symbolice* of keys of a warehouse to give possession of the articles contained therein, and of a deed in confirmation of the covenants contained therein. The 'fiction of the unity of the persons' was the original of the Scottish fiction that 'The heir is the same as the deceased.' But in no system of laws have fictions

been so liberally adopted as in that of England. It was by means of fictions alone that the original limited jurisdiction of the courts of Queen's Bench and Exchequer was extended to ordinary suits. In the latter court every plaintiff assumed that he was a debtor to the crown, and was debarred from discharging his obligation by the failure of the defendant to satisfy his demand; in the former it was assumed that the defendant had been arrested for some supposed trespass which he had never in fact committed. The fictitious characters of John Doe and Richard Roe long contributed to make the action of Ejectment (q.v.) famous. And though these fictions have disappeared before the ruthless hand of modern legislation, yet to this day in England, in an action at the instance of a father for the seduction of his daughter, damages can only be awarded on the assumption that she was his servant, and that he has suffered pecuniary loss by deprivation of her services. In the law of Scotland fictions of law are not of frequent occurrence. For the benefit of creditors the principle that the heir is 'the same person as the deceased' is admitted; and in an action of 'Reduction-improbation' of a deed it is assumed that the document was false, whether the fact be so or not. The legitimization of natural children by the subsequent marriage of their parents is an instance of what is called a retroactive fiction. See Maine's *Ancient Law*, and Colquhoun's *Summary of the Civil Law*.—For works of fiction, see NOVELS.

**Ficus**. See FIG.

**Fiddle**. See VIOLIN.

**Fideicommissum**, in the Civil Law, was a conveyance of property in trust to be transferred to a third person named by the trustor. *Fideicommissa*, when first introduced, were not supported by the law. The performance of them depended, therefore, on the conscience of the party intrusted, and consequently they were frequently not carried out. They were originally adopted for the purpose of conveying property either where a party, from the circumstances of the case, as inability to procure the proper number of witnesses, was prevented from executing a will, or where he desired to benefit those who by law were precluded from taking the property. To effect this purpose an actual conveyance was made to a friend, coupled with a request that the property should be transferred to another. *Fideicommissa*, having thus been introduced for a special purpose, were by degrees extended to conveyances of the whole inheritance, and finally were used for the purpose of settling estates in a particular order of succession, forming the earliest instance of Entails (q.v.). *Fideicommissa* first received the sanction of positive law in the reign of Augustus, by whom authority was given to enforce the performance of these fiduciary obligations. A special praetor was afterwards appointed for the enforcement of trusts, and the Emperor Claudius subsequently extended this authority to the consuls and presidents of provinces. *Fideicommissa* were either *particular* or *universal*, the former being a bequest of a particular subject, or a part only of the inheritance; the latter comprehended the whole estate. The *Senatus-Consultum Trebellianum* enabled a person profiting by a universal succession of this kind to sue or be sued as heir.

In Holland the principles of the civil law as to *fideicommissa* form an important branch of the law in regard to landed estates. An heir may be required to transfer either the whole or a portion of his inheritance. The provisions of the *Senatus-Consultum Trebellianum* also have been adopted. Children who have received their legal portions, and are required to transfer to a stranger the rest

of the inheritance, are entitled to retain a fourth part for themselves. Similar provision may be found in the legislation of other countries which follow the civil law. See Hunter's *Roman Law*, and the Dutch and German manuals of Civil Law.

**Fidei Defensor.** See DEFENDER OF THE FAITH.

**Fief.** See FEUDALISM.

**Field**, in Heraldry, the whole surface or content of the escutcheon or shield. See HERALDRY.

**Field**, DAVID DUDLEY, an American jurist, the eldest son of a Congregational minister (1781-1867), was born in Haddam, Connecticut, in 1805, and was admitted in 1828 to the New York bar, at which he practised until 1885, distinguishing himself especially by his labours in the direction of a reform of the judiciary system. In 1857 he was appointed by the state to prepare a political, civil, and penal code, of which the last has been adopted by New York, and all have been accepted by some other states. In 1866, by a proposal brought before the British Social Science Congress, he procured the appointment of a committee of jurists from the principal nations to prepare the outlines of an international code, which were presented in a report to the same congress in 1873. This movement resulted in the formation of an association for the reform of the law of nations, and for the substitution of arbitration for war, of which Mr Field was the first president. After the election of 1876 he advocated Tilden's cause in the dispute over the presidency. In 1889 he received the degree of LL.D. from the university of Edinburgh.

His brother, STEPHEN JOHNSON FIELD, born in Haddam in 1816, was for some time a partner in Dudley's firm, and settled in 1850 in California, where he was instrumental in forming the laws of the state, and was judge of the Supreme Court in 1857-59. Appointed chief-justice in 1859, he was raised to the supreme bench of the United States in 1863, and voted with the Democratic minority of the electoral commission in 1877. In 1880 he received 65 votes on the first ballot for the presidential candidate.

Another brother, CYRUS WEST FIELD, was born in Stockbridge, Massachusetts, in 1819, and at the age of fifteen entered the employment of A. T. Stewart, in New York. In the twelve years preceding 1853 he built up a prosperous paper-manufacturing business, from which he then partly retired, only to engage with great enthusiasm in the promotion of the Atlantic telegraph. For this he secured a charter from the colonial government of Newfoundland for fifty years; and, being joined by Peter Cooper and other American capitalists, he organised the New York, Newfoundland, and London Telegraph Company in 1854, and the Atlantic Telegraph Company in 1856. Devoting himself entirely to the work of 'mooring the New World alongside the Old,' he crossed the ocean repeatedly, labouring to arouse public interest in the project; and when the first cable was successfully laid in 1858 he was hailed by his countrymen with the enthusiasm his efforts had deserved. After a few weeks' operation the cable was silent; but he continued his exertions, although the civil war for a time absorbed all attention; and on the establishment in 1866 of the telegraphic communication between the two continents, which has never since been interrupted, he received from congress a gold medal and the thanks of the nation. He also was awarded the grand medal of the Paris Exhibition of 1867. He afterwards helped to develop the elevated railway system in New York, and obtained concessions for the laying of a cable between San Francisco and the Sandwich Islands. See ATLANTIC TELEGRAPH.

**Field**, JOHN, musician and composer, commonly known as Russian Field, was born in Dublin, 26th July 1782. A pupil of Clementi, he accompanied him in 1802 on a continental tour, but, settling in St Petersburg as a teacher of music, remained there from 1804 till 1823, when he proceeded to Moscow; in 1832 he returned to London. Nevertheless in the following year he once more started on a long continental tour, which terminated with his death at Moscow on January 11, 1837. Although Field wrote seven concertos, three sonatas, and numerous pianoforte pieces, he is to-day only remembered as the author of about half-a-dozen *Nocturnes*, charming little musical lyrics. Liszt wrote an essay on Field, prefixed to Schubert's edition of the *Nocturnes*, and Spohr in his *Selbstbiographie* (vol. i.) gives some account of Field himself.

**Field-allowance**, a daily allowance granted to officers of the British army in consideration of extra expense entailed upon them in consequence of military operations. *Ordinary* field-allowance, ranging from £1, 10s. for a general officer to 1s. for a subaltern, is allowed when troops are encamped at home or in the colonies. *Extraordinary* field-allowance is sanctioned when troops are engaged in actual warfare; it ranges for the above ranks from £2, 10s. to 1s. 6d.

**Fieldfare** (*Turdus pilaris*), a species of thrush, common in Britain as a winter visitor. It is a native of North Europe, breeding and spending the summer in Scandinavia and other northern countries, but migrating southwards in winter as far at least as the Mediterranean. It is very abundant in Norway, and, contrary to the ordinary habit of thrushes, is social in its nest-building,

Fieldfare (*Turdus pilaris*).

numerous nests being often seen on one spruce-tree. There are a few reported instances of the fieldfare nesting in Britain. As a winter visitor it has familiarised us with its harsh call-note, but its true melodious song is mostly reserved for the northern summer. The fieldfare is about the size of a blackbird, but has longer wings. The head, neck, and some other parts are grayish; the tail is black, with a white line on the outer feathers; the general upper surface is chestnut brown; the under surface is white, with a reddish-yellow breast streaked and spotted with black. In Britain the fieldfare feeds on worms, snails, and such like, or in severer weather on haws and other available fruits and seeds. It is sometimes named as a songster. See THRUSH.

**Field-glass.** See OPERA-GLASS.

**Fielding**, ANTHONY VANDYKE COPLEY, water-colour painter, was born in 1787. He came of an artistic family, for his father, T. N. Fielding, was a portrait-painter residing near Halifax, his mother

became a member of the Water-colour Society, and three of his brothers were painters in the same medium. He received his early instruction at home before being placed under John Varley; and, like Turner and Girtin, he worked in the house of Dr Mouro. In 1810 he began to exhibit with the Water-colour Society, of which he was successively treasurer and secretary; and in 1831 he succeeded Cristall as president. In one year he contributed to the exhibition of the society no fewer than 56 subjects, occasionally, in addition, sending an oil-picture to the Royal Academy. His early works show breadth, freedom of treatment, and a fine sense of atmosphere; but in later life the quality of his art deteriorated, greatly in consequence of the facile methods and mannerisms—such as the excessive use of sponging and washing—which his practice as a fashionable teacher of painting had led him to adopt. He died at Worthing, 3d March 1855. His art may be adequately studied in the South Kensington Museum.

**Fielding.** HENRY, born at Sharpham Park, Glastonbury, April 22, 1707, was the son of Lieutenant (afterwards General) Edmund Fielding, who belonged to the younger branch of the Denbigh family. He went to Eton, which he left before November 1725. After a boyish and frustrated love-affair at Lyme Regis with a relative and an heiress, Miss Sarah Andrew (see *Athenæum*, 2d June 1883), he passed to Leyden University, where he appears to have graduated in March 1728. But he must have returned to England before this, because his first comedy, *Love in Several Masques*, was produced at Drury Lane in February. *The Temple Beau* followed two years later. From this date until February 1735 he wrote a number of comedies and farces, the best of which are *The Author's Farce* (1730), the burlesque of *Tom Thumb*, afterwards *The Tragedy of Tragedies* (1730), *Don Quixote in England* (1734), *The Mock Doctor* (1732) and *The Miser* (1733), two adaptations from Molière, and *The Intriguing Chambermaid* (1734), an adaptation from Regnard. His dramatic works in general bear signs of haste and carelessness. A brief interval in their rapid manufacture which occurred between 1735 and 1736 is supposed to have been filled by his marriage to Miss Charlotte Cradock, a Salisbury beauty and his acknowledged model for 'Sophia Western' (*Tom Jones*, book xiii. chap. i.).

For a few months Fielding appears to have led the life of a country gentleman at East Stour in Dorsetshire, where he had resided as a boy. But his wife's fortune of £1500 was not inexhaustible, and early in 1736 (probably with what remained of it) he took the Little Theatre in the Haymarket, where he brought out two very successful burlesques—*Pusquin* (1736) and the *Historical Register* (1737). The bold satire on the ministry contained in these pieces led to the precipitate passing of the Licensing Act of 1737, which made the consent of the lord chamberlain necessary to the representation of any play. This effectually closed Fielding's theatre, and in November 1737 he became a student of the Middle Temple. He was called to the bar in 1740, and travelled the western circuit. But, though he does not seem to have neglected law, he did not relinquish literature. During his studentship he edited (with James Ralph) the *Champion*, a paper of the *Spectator* type. His real *début*, however, came in 1742, not long after Richardson published his popular *Pamela*. Apt at burlesque and eminently manly, Fielding's genius saw at once how effectively ridiculous the feebler side of Richardson's morality might be made by transferring his heroine's difficulties to a male hero. Designing at first no more than raillery, his plan

grew under his hand, and gradually became a novel of life and manners, with a group of characters, of which one, Parson Abraham Adams (based on the writer's friend, William Young) is immortal. His success, probably revealed to him a power he had scarcely suspected, and opened a wider perspective of fiction. But for the moment his precarious means prompted no more than the publication by subscription of three volumes of *Miscellanies*, made up mainly of early work. They included another play, *The Wedding Day*, an old comedy revised for Garrick, and produced at Drury Lane without success in February 1743, some essays, some youthful verse, a clever Lucianic fragment called *A Journey from this World to the Next*, and the surpassing study in irony known as the *History of the Life of the late Mr Jonathan Wild the Great*. Despite its maturity, it had probably been written before *Joseph Andrews*, as it seems unlikely that after so signal a success its writer would have essayed a line so different.

From the preface to the *Miscellanies* it is clear that Fielding's circumstances at this date were far from good. His means were uncertain, his health already broken (he was a martyr to gout), and his beautiful wife an invalid. Shortly after April 1743, when the book was published, she seems to have died, leaving him so heart-broken by her loss that his friends feared for his reason. From the preface to his sister's novel of *David Simple* (2d ed. 1744), he still appears to have hoped for success at the bar. But in 1745 he again drifted into journalism as the author of the *True Patriot*, a government organ, succeeded in 1747 by the *Jacobite's Journal*. In November 1747 he married his wife's maid, Mary Daniel, who had remained in charge of his children by his first marriage; and a year later, by the interest of his schoolfellow Lyttelton, he became a justice of the peace for Westminster, moving into a house in Bow Street belonging to the Duke of Bedford. Thence in February 1749 he put forth a second novel, his famous *Tom Jones*, the 'labour,' he says, 'of some years.' Less than three years later came a third novel, *Amelia*. The remainder of his life was a continued struggle with ill-health and a harassing vocation, which he nevertheless followed most assiduously. His further literary efforts are confined to a few pamphlets, philanthropic and professional, and a fresh periodical, the *Covent Garden Journal* (1752). In 1754, sinking under a complication of disorders, but gallantly struggling with his magisterial duties to the last, he quitted England for Lisbon in search of health. After a voyage of many vicissitudes, narrated with the most touching and manly cheerfulness in his posthumously printed *Journal*, he reached the Portuguese capital, where he died two months later, 8th October 1754, aged forty-eight. He was buried in the English cemetery. *Luget Britannia gremio non dant foreve natum*, says the inscription on his tomb.

The only portrait of Fielding is a sketch from memory by his friend Hogarth, whose works he greatly admired. Representing him in later life, it exhibits little more than the shadow of that handsome Harry Fielding who at twenty rushed upon London from Leyden in all the ardour of health and animal spirits. He paid the penalty of his youthful appetite for pleasure by a broken and laborious middle age, endured with a courage and fortitude which command respect. Of his work his three novels now chiefly survive. His plays were hasty and ill-considered productions; and he is best in pure burlesque, or when he takes his plot ready-made. His essays and journalism are hack-work. But he is fairly what Scott calls him, the 'Father of the English Novel.' In *Joseph Andrews* he first felt his feet; in *Tom Jones* he perfected his

method and put forth his full powers. When Coleridge extravagantly praised its plot, the modern novel was yet young, and the dictum new needs qualification. But the skill and variety of the book, its close characterisation, its happiness of illustration, and the wealth of wit, wisdom, and irony cannot be contested. There are—and it is to be regretted—pages which show an artistic insensibility, and an over-indulgence to certain forms of masculine frailty which even the manners of the time cannot wholly excuse; but apart from this there is no reason to doubt the sincerity of the moral purpose proclaimed. *Amelia*, a shorter, more subdued, and less elaborated work, has also its admirers. But Fielding put his best 'criticism of life' into *Tom Jones*.

His biography has been written by Murphy (1762), Watson (1807), Lawrence (1855), and Austin Dobson in the 'Men of Letters' series (1883, revised ed. 1889). Thackeray's sympathetic lecture and Mr Leslie Stephen's valuable introduction to the *édition de luxe* of 1882 cannot be neglected.

**Field-madder** (*Sherardia arvensis*, order Rubiaceae), a small purplish weed, common on cultivated lands, and said to be mischievous to sheep. The root can be used as a substitute for the closely allied true Madder (q.v.).

**Field-marshal** is now the highest rank of general officer in the British and most foreign armies. In the former it is a special honour only conferred on the ground of distinguished service or royal birth. In 1889 there were six officers, including the Prince of Wales and Duke of Cambridge, holding this rank. A field-marshal has no higher pay than any other general, except when commanding an army; he then receives £10, 8s. 9d. a day for staff-pay, while a general has but £9, 9s. 6d. The equivalent rank in the navy is that of admiral of the fleet. The title is not used in the United States army.

**Field-mouse**, a name popularly given to certain species both of Mouse (q.v.) and of Vole (q.v.). See also SHREW.

**Field-officers**, in the Army, are always mounted officers—viz. majors, lieutenant-colonels, and colonels. They command, in the infantry, half-battalions (or wings), battalions, and regiments respectively; whilst the captains, lieutenants, and sub-lieutenants are called company officers. In the cavalry, artillery, engineers, and other corps, officers bearing the same titles are called field-officers, but their duties and commands are different from those of the infantry.

**Fields**, JAMES THOMAS, American publisher, was born in Portsmouth, New Hampshire, in 1817, and from 1839 to 1870 was a partner in the publishing firm of Ticknor, Reed, and Fields in Boston. He edited the *Atlantic Monthly* in 1862-70, and for many years lectured on literary subjects; and he wrote some books of verse, besides interesting volumes on Hawthorne and Dickens. He died in Boston, 24th April 1881.

**Field-train**, formerly a department of the Royal Artillery responsible for the custody and supply of artillery ammunition in the field. The duties are now performed by the Ordnance Store Department.

**Field-works** are intrenchments and other temporary fortifications thrown up by an army in the field, either as a protection from the onslaught of a hostile force, or to cover an attack upon some stronghold. Field-works will be more particularly described under the article FORTIFICATION.

**Fieri Facias**, WRIT OF. The judgment or order of an English court of law, directing the payment of money or costs, may be enforced by a

writ of execution called the writ of *fieri facias*—often contracted to *fi. fa.* It is, in form, a command by the sovereign to the sheriff of the bailiwick in which execution is to be levied, to 'cause to be made' (*fieri facias*) out of the goods and chattels of the debtor the amount of the judgment entered against him, together with interest thereon, as agreed between the parties, or at the rate of 4 per cent. from the day of the judgment or order, or the day from which interest is directed to run. A judgment creditor may sue out this writ immediately after entry of judgment in his favour, except where a time is limited for payment of the judgment debt which has not yet expired, or where the court has ordered a stay of execution. As between the original parties to a judgment or order, execution may issue at any time within six years from the recovery of the judgment or the date of the order.

In regard to the execution of a writ of *fieri facias*, the sheriff must seize such quantity of the goods and chattels of the debtor within his bailiwick as will, if sold, be reasonably sufficient to pay the judgment debt and interest. Seizure is effected by the sheriff or his officer taking actual possession of the debtor's movable property. In entering upon the premises where the goods and chattels are, the sheriff must request admission, and is liable to an action of damages if he breaks open an outer door of the judgment debtor's house. But, having once effected an entry, he may break open inner doors and chests, if necessary to his purpose. Possession of the debtor's property must be retained after seizure; and the sheriff may—and, where there is any risk of injury or rescue, ought to—remove the goods for safe custody. If the debtor do not at once satisfy the judgment debt, the sheriff may proceed to sell a sufficient quantity of the debtor's property to meet it; and then, as a matter of practice, he hands over the amount to the judgment creditor without bringing or paying it into court. The Bankruptcy Act of 1883 provides that, where the sheriff sells the goods of a debtor under an execution for a sum exceeding £20, the sale shall be by public auction, and shall be publicly advertised by the sheriff on and during the three days next preceding the sale. Seizure and sale of a debtor's goods under a writ of *fieri facias* amounts to an act of bankruptcy. An execution creditor may levy the poundage fees and expenses of execution over and above the sum recovered.

The property legally available for seizure and sale under a writ of *fi. fa.* may consist of (1) goods and chattels in the ordinary sense of the term, such as furniture belonging to the debtor; (2) money, bank-notes, bills of exchange, and other securities; (3) chattel interests in land, such as leaseholds; (4) growing crops, subject to the rent accruing due; (5) shares in ships (the only legal method of selling such shares is by bill of sale).

If goods are removed from lands or premises let on lease, the sheriff must levy sufficient to pay to the landlord the sum due for arrears of rent, provided such arrears do not amount to more than one year's rent. A sheriff may not take in execution (1) manure, hay, &c., where by the covenants of the lease the tenant is restricted from removing them; (2) the wearing apparel or bedding or tools of the debtor, where the value of the whole does not exceed £5; (3) such fixtures as the judgment debtor himself has no right to remove. At common law the writ of *fieri facias* 'bound' the debtor's goods from the *teste*, or date of issue; the Statute of Frauds provided that no purchaser should be prejudiced till the writ had actually been delivered to the sheriff for execution; while the Mercantile Law Amendment Act, 1856, enacts 'that a writ of *fieri facias* shall not prejudice the title to goods

acquired *bonâ fide* and for value by any person before the actual seizure thereof under the writ.

Where it appears by the return of a writ of *fi. fa.* that the debtor is a beneficed clerk not having any lay fee within the sheriff's bailiwick, the plaintiff may sue out a writ of *fieri facias de bonis ecclesiasticis*, directed to the bishop of the diocese, commanding the debtor to enter upon and hold the benefice till he shall have satisfied the plaintiff's judgment debt out of the rents, tithes, and profits thereof. See Stephen's *Commentaries* (ed. 1883, iii. p. 599); Edwards, *On Execution*; Snow and Winstanley, *Annual Practice*, 1888-89.—In Scotland the corresponding process for seizing and selling a debtor's goods is termed *Pointhing* (q.v.).

**Fiery Cross**, an ancient summons to arms used in the Scottish Highlands, sent by swift messengers from place to place. It was a small cross of light wood, the extremities of which were set on fire, and then dipped in the blood of a goat.

**Fieschi**, COUNT GIOVANNI LUIGI DE', a member of one of the most illustrious houses of Genoa, was born about the year 1523. In addition to the lustre of ancestral fame, his name has attained a tragic historical celebrity in connection with a remarkable conspiracy of which he was the chief. Andrea Doria, the famous admiral, sprung from a race hereditarily at feud with that of Fieschi, having expelled the forces of Francis I. from the state, had restored the republican form of government, but at the same time, by his vigorous administration, effectually held in check the ambition of the nobles. Count Fieschi organised a plot for the overthrow of Doria (who was supported by the Emperor Charles V.) and the establishment of an oligarchic form of government. Instigated by the approval of France and Rome, Fieschi speedily enrolled a formidable array of accomplices, his three brothers among the foremost. Three galleys, under the pretext of an expedition against the Turks, were fully equipped and filled with mercenaries; and, all being in readiness, the attempt was fixed for the 2d of January 1547. Doria, in spite of repeated warnings, refused to ascribe treacherous or subversive designs to Fieschi. Complete success seemed at first to crown the conspirators; the gates of the city were forced, the fleet captured, Gianettino assassinated, Doria in flight. Fieschi had but to appear and dictate, but he was nowhere to be found. In stepping from one galley to the other in the darkness of night he had stumbled, and, falling overboard, been borne down by his ponderous armour, and miserably drowned in the harbour, or, according to some, stifled in the sluice. The scheme ended here, and Doria returned. See DORIA, GENOA; and the monographs of Brea (1863) and Cesalia (1864).

**Fieschi**, JOSEPH, known by his attempt on the life of King Louis-Philippe, was born in Corsica in the year 1790. He served in Russia in 1812, and on Murat's expedition suffered imprisonment as a thief, but in 1830 got a small government appointment at Paris. Dismissed for fraudulent conduct, he secured accomplices in an audacious plan, and invented an infernal machine with twenty-four barrels, which was fired while the king and his party were passing the house, 28th July 1835. Eighteen people were killed, among whom was Marshal Mortier, but Louis-Philippe himself escaped with a mere scratch. Fieschi was immediately seized, and, along with his accomplices, was tried, condemned, and executed on 16th February 1836. See Ducamps, *L'Attentat Fieschi* (1877).

**Fiésolè** (Lat. *Fasula*), one of the most ancient of Etruscan cities, is situated on the crest of a hill, about 3 miles N.E. of Florence. Here the Gauls

defeated the Romans in 225 B.C.; and here Hannibal encamped after crossing the Apennines. The city was made a military colony for Sulla's veterans, who twenty years later lent warm support to Catiline. The place was seized by the Goths, and was not captured by Belisarius until after a long siege. Its decay began in the middle ages with the rise and growth of Florence, and it has now only about 2000 inhabitants, chiefly occupied in straw-plaiting. The sole vestige of Etruscan architecture remaining is the cyclopean wall. The amphitheatre and other remains belong to the Roman age. The town has several buildings dating antecedent to the 15th century, amongst them the cathedral, built in 1028 and restored in 1256; a pictorial palace of the 13th century; and a Dominican (1406) and a Franciscan (1350) monastery.

**Fiesole**, GIOVANNI DA. See ANGELICO, FRA.

**Fife**, a smaller variety of the flute, usually with only one key. Fifes were at one time generally used in the army and navy in conjunction with drums, for playing marches and other simple melodies. They are usually pitched in the keys of B♭ or C. Originally the life was made with a cylindrical bore throughout, but this was many years ago superseded by the conical instrument. It is rather curious that the ancient cylindrical bore superseded as unsuitable in the fife should have been resuscitated and perfected in the modern Flute (q.v.). See BAND (MILITARY).

**Fife**, a maritime, almost peninsular, Scottish county, washed on the N. for 21 miles by the Firth of Tay, on the E. for 24 by the German Ocean, and on the S. for 53 by the Firth of Forth. Its extreme length is 42 miles, its extreme breadth 21, and its area 513 sq. m. The surface offers a succession of cultivated vales and hills, the most prominent eminences being the East and West Lomonds (1471 and 1713 feet), Largo Law (905), and Burntisland Bin (632). Almost the only streams are the Eden (30 miles long) and the Leven (16); whilst of seven lakelets the chief are Kilconquhar Loch (4 by 3 furlongs) and Lindores Loch (7 by 3). Fife rests on the Old Red Sandstone, with trap rocks in the north, carboniferous strata and trap in the south. Its mineral wealth includes coal (which is largely mined), shale, ironstone, limestone, and freestone. The soil is some of it very fertile, especially in the Howe of Fife, or Stratheden; and whilst barely one-fourth of the whole of Scotland is in cultivation, in Fife the proportion is nearly three-fourths. One-seventeenth is under wood. 'A gray cloth mantle with a golden fringe,' said James VI. of Fife, referring to the many towns and fishing-villages that skirt its ancient sea-margin—Inverkeithing, Burntisland, Kinghorn, Kirkealdy, Dysart, Leven, Largo, Elie, St Monans, Pittenweem, the Anstruthers, Kilrenny, Crail, St Andrews, Ferryport, Newport, and Newburgh. Inland lie Cupar, Dunfermline, Falkland, Lochgelly, &c. Under those towns are noticed the manufactures, the chief antiquities, the illustrious natives, and the outstanding points in the peaceful history of the 'Kingdom of Fife,' which took so leading a part in the Scottish Reformation. Here, then, we need mention only the fine Romanesque church of Leuchars; the ruined abbey of Balmerino and Lindores; Magnus Muir, the scene of Sharp's murder; Cults, the birthplace of Wilkie; and Balcarres, of Lady Ann Barnard. Fife returns two members to parliament. It is seventeenth in size among Scottish counties, but fifth in rental, seventh in population—(1801) 93,743; (1841) 140,140; (1881) 171,931; (1891) 187,320—only 40,000 being rural. See Sir Robert Sibbald's *History of Fife* (1710), A. H. Millar's *Castles and*

*Mansions of Fife* (1889). *Fife Ness*, the eastmost point of Fife, is a low headland. A mile NNE. in the sea is the dangerous Carr Reef, where a light-ship was moored in 1886.—The county has since 1759 given the title of Earl of Fife to the family of Duff. The sixth earl (born 1849) married in 1889 the Princess Louise of Wales.

**Fifth-monarchy Men**, an extreme sect of the time of the Puritan revolution, strongly represented in Cromwell's army, who looked on the establishment of his power as the commencement of a new reign of Christ on earth, in succession to the four great monarchies of Antichrist marked out by the prophet Daniel. Their wild destructiveness quickly brought them under the iron hand of Cromwell, who with characteristic vigour crushed their rebellious intrigues with his soldiers, and their plot to murder himself, and in 1657 hung their leaders, Venner, Grey, and Hopkins, into prison. In January 1661 Venner headed another rising in London, for which he and sixteen others were executed.

**Fig** (*Ficus*), a genus of trees and shrubs belonging to the order Urticaceæ (sub-order Moraceæ), characterised by the remarkable inflorescence in which that normal sheathing of the flowering axis which reduces the elongated spike to the flat capitulum has gone so far as to render this positively concave, the apex thus coming to be at the bottom of a cup (see INFLORESCENCE). This axis almost closes upon the small internal flowers, save for a small opening at the apex, and becomes succulent and fruit-like. It is always monoecious or dioecious. The male flowers, which in the monoecious species develop round the opening of the fig, have three or five stamens, and the female, which arise on the sides and bottom, a bilobed stigma, but the ovary contains only a single seed, which becomes stony. For fertilisation, see CAPRIFICATION, and FLOWERS. There are about 300 species, some of them very large trees. Almost all belong to tropical and subtropical countries, of the vegetation of which they often form a most important feature. They abound in India, in every jungle and hilly situation, to the most northern Himalaya, and some of them are cultivated about every village. Both *F. religiosa* (the Peepul) and *F. Rumphii* are held in veneration by the Hindus. The most notable species are the Common Fig (see below); the Banyan (q.v.); the Peepul (q.v.); Bo Tree, or Sacred Fig of India; the Sycamore (q.v.); and the India-rubber Fig (*F. elastica*). See INDIA-RUBBER. The leaves of some species are entire, those of others are lobed. Several species of fig exhibit the character, for which the banyan in particular has become celebrated, of sending roots straight down to the ground from their spreading branches, and thus multiplying the apparent stems, by which a vast canopy of branches and foliage is supported. The East Indian Cantchouc or India-rubber Tree is remarkable for the exposure of its main roots, which rise in masses above ground, extending on all sides from the base like great writhing snakes. Some figs are creeping or trailing shrubs, with slender stems, covering heaps of stones, or ascending trees like ivy. Besides the common fig, many species yield edible fruits, although none of them are nearly equal to it in value. The milky juice of several species is bland and abundant, as of *F. Saussureana*, which has therefore been ranked among Cow-trees. In other species the milky juice is very acrid. That of the common fig produces a burning sensation on the tongue. That of *F. toxicaria*, a native of the Malayan islands, is used for poisoning arrows. Lac (q.v.) is gathered from some species. The leaves of *F. politoria* are so rough that they are used for polishing wood and

ivory in India. The juice of the fruit of *F. tinctoria* is used in Tahiti to dye cloth; the colour is at first green, but being acted on by the juice of a *Cordia* it becomes bright red. The bark supplies cordage, of which fishing-nets are made.

The Common Fig (*Ficus carica*) is a native of the East, as the specific name (from *Carica*) imports; but it is now cultivated throughout the whole of the south of Europe, and is even found naturalised there. Its cultivation has also extended to many warm countries. In North America it is seldom to be seen farther north than Philadelphia; and it is not sufficiently hardy to be a common fruit-tree in Britain, although even in Scotland figs

Common Fig (*Ficus carica*):  
a, fruit; b, section of fruit.

may occasionally be seen ripened on a wall; and in the south of England fig-trees are sometimes grown as standards, and a few small fig orchards exist. It seems to have been grown in England by the Romans, but was not reintroduced until 1525, when Cardinal Pole brought several trees to Lambeth from Italy. Protection is given in some way during winter. Near Paris, and in some other parts of the continent of Europe, fig-trees are so trained that the branches can be tied in bundles and laid along the ground, when they are covered with litter and earth, or, as in the case of the celebrated fig-tree of Roscoff (Finistère), the branches are trained over a vast area of pillared framework. The fig is a low deciduous tree or shrub (15-25 feet), with large, deeply-lobed leaves, which are rough above and downy beneath. The branches are clothed with short hairs, and the bark is greenish. The fruit is produced singly in the axils of the leaves, is pear-shaped, and has a very short stalk; the colour in some varieties is bluish-black; in others, red, purple, yellow, green, or white. The varieties in cultivation are numerous. In warm climates the fig yields two crops in the year—one from the older wood (midsummer shoots of the preceding year), and a second from the young wood (spring shoots of the same year); but in colder regions the latter never comes to perfection. Fig-trees are propagated by seed, by suckers, &c.; very frequently by layers or by cuttings. In Britain they are often to be seen in greenhouses, and grow well in pots. If the soil of the open border is too rich, root pruning must be adopted, although liquid manure may be given while the figs are swelling. Figs may be eaten 'green' (i.e. ripe) or dried, and the latter form an important article of food in the Levant; in more northern regions they are used for dessert, or for medicinal purposes, being applied to gunboils and other sores, and also administered

in pulmonary and nephritic affections, and to relieve habitual constipation. The pulp contains about 62 per cent. of grape-sugar. Figs are either dried in the sun or in ovens built for the purpose. Great quantities are annually imported into Britain from the Mediterranean. The best are mostly brought from Smyrna. Greece and various parts of Italy also export figs. The finest kinds are tightly packed in boxes; others are crowded into sacks of matting, or strung, by a hole in the middle, on strings of bast. In the Levant, Portugal, and the Canaries a spirit is distilled from fermented figs. In some places figs roasted and ground are used to produce the so-called fig coffee; the excellence of the Vienna coffee is sometimes attributed to an admixture of ground figs.

The fig has been reckoned among the most valuable fruits since the earliest times; thus, it is mentioned with corn, wine, and oil as one of the leading riches of the promised land. The Athenians, too, seem to have largely subsisted upon figs, especially before the culture of cereals became general; and a fig-tree was the device of the city. It appears that special officers were appointed to denounce illicit export or engrossing of figs, the 'sycophants,' whose title came to acquire such different meanings. But it must be noted that the word 'sycophant' in this its literal sense is not found in any ancient author. See Solms-Laubach, *Domestikation des Gewöhnlichen Feigenbaums* (Göttingen, 1882).

**Figaro**, a dramatic character introduced on the Parisian stage in 1785 by Beaumarchais (q.v.) in his *Barbier de Seville* and his *Mariage de Figaro*, is first a barber and then a valet-de-chambre, and has become a type of cunning, intrigue, and dexterity. Mozart and Rossini made Beaumarchais's plays the basis of classic operas. The name has been adopted by a well-known Parisian newspaper (founded 1854).

**Figeac**, a town in the French department of Lot, is situated in a valley surrounded by finely wooded hills, 32 miles E.N.E. of Cahors. Irregularly built, with a medieval aspect, it possesses two beautiful Gothic churches, and owes its origin to a Benedictine monastery founded by Pepin the Short in 755. Figeac has cotton manufactures, dye-works, and a trade in cattle. Pop. 5782.

**Fighting-fish** (*Betta pugnax*), a small freshwater fish, especially at home in Siam, where it is reared on account of its curious pugnacity. It belongs to the family Labyrinthici, which includes other interesting fishes, such as the Climbing Perch (Anabas), the beautiful Paradise-fish, the well-flavoured Gourami. When two fighting-fish are brought together they often rush immediately to combat; or it is even enough to introduce a looking-glass into the water, when the fish hastens to attack its own image. Fish-fights are a favourite amusement of the Siamese; the license to exhibit them yields a considerable annual revenue; and an extraordinary amount of gambling takes place in connection with them—not merely money and property, but children and liberty being sometimes staked. When the fish is quiet its colours are dull; but when it is excited they glow with metallic splendour, and 'the projected gill-membrane, waving like a black frill around the throat, adds something of grotesqueness to the general appearance.'

**Figueira**, a watering-place in the Portuguese province of Beira, at the mouth of the Mondego, 23 miles W. by S. of Coimbra. Its harbour is excellent, but difficult of access. Pop. 4470.

**Figueras**, a town in the north-east corner of Spain, on a marshy plain, 25 miles N. of Girona by rail, with soap, paper, and leather manu-

factories. Overlooking the town is the strong frontier fortress of San Fernando, constructed by Ferdinand VI. In the vicinity of the town are gold and copper mines. On three occasions (1794, 1808, 1823) Figueras has been taken by the French. Pop. 11,750.

**Figueras**, ESTANISLAO, a Spanish statesman, was born at Barcelona, 13th November 1819. Although he joined the republican party in 1840, he was not elected to the Cortes until 1850. For taking part in republican plots in 1866 he was in the following year cast into prison; but after the expulsion of Queen Isabella he became a member of the republican committee of government. Finally the abdication of King Amadeus, in 1873, opened the way for Figueras, and he became president of the Spanish republic; but, owing to differences with his colleagues in power, he was constrained to resign office after only about four months' exercise of authority. Retiring from public life, he died at Madrid on 11th November 1882.

**Figuer**, LOUIS, writer, was born at Montpellier, 15th February 1819. His first appointment as professor was at the Montpellier school of pharmacy in 1846; seven years later he removed to Paris to occupy a similar post there. Amongst his books are several on the wonders, inventions, and discoveries of modern science and modern industry, a volume on alchemy, and one in defence of the immortality of the soul. Many of these have been translated into English (*The Ocean World*, *The World before the Deluge*, *The Day after Death*, &c.). His wife, Juliette Figuer, has written several novels.

**Figurantes** is the term applied in the ballet to those dancers who do not come forward alone, but dance in troops, and also serve to fill up the scene and form a background for the solo dancers.

**Figurate Numbers**. The nature of figurate numbers will be understood from the following table:

|      | 1, | 2, | 3,  | 4,  | 5,  | 6,   | 7, &c.   |
|------|----|----|-----|-----|-----|------|----------|
| I.   | 1, | 3, | 6,  | 10, | 15, | 21,  | 28, &c.  |
| II.  | 1, | 4, | 10, | 20, | 35, | 56,  | 84, &c.  |
| III. | 1, | 5, | 15, | 35, | 70, | 126, | 210, &c. |
|      |    |    | &c. |     |     | &c.  |          |

The natural numbers are here taken as the basis, and the first order of figurate numbers is formed from the series by successive additions; thus, the fifth number of the first order is the sum of the first five natural numbers. The second order is then formed from the first in the same way; and so on. If instead of the series of natural numbers whose difference is 1, we take the series whose differences are 2, 3, 4, &c., we may form as many different sets of figurate numbers. The name *figurate* is derived from the circumstance that the simpler of them may be represented by arrangements of equally distant points, forming geometrical figures. The numbers belonging to the first orders receive the general name of *polygonal*, and the special names of *triangular*, *square*, *pentagonal*, &c., according as the difference of the basis is 1, 2, 3, &c. Those of the second orders are called *pyramidal* numbers, and according to the difference of the basis are *triagonally*, *quadrangonally*, or *pentagonally* pyramidal. The polygonal numbers may be represented by points on a surface; the pyramidal by piles of balls.

**Figure**, in Music. See MOTIV; for Figured Bass, see ACCOMPANIMENT.

**Figure-head**, the ornamental figure or bust on the head of a ship, immediately under the bowsprit. Where the vessel's name cannot be represented by such a figure, a piece of timber, finished off in the form of a volute or scroll, often takes its

place on sailing-ships; on steamships the bow is usually plain. The huge figure-heads of several historical old line-of-battle ships are still carefully preserved at Millwall, including that of the 'fighting Téméraire.'

**Figure-stone.** See STEATITE.

**Figwort**, a name sometimes applied to *Scrophularia nodosa* (see SCROPHULARIA), and sometimes to *Ranunculus Ficaria*, the lesser Celandine (see CELANDINE).

**Fiji.** The Fiji or Viti Islands are a British dependency in the South Pacific Ocean, situated in 15°—22° S. lat. and 176° E.—178° W. long. Their nearest neighbours are the Tonga or Friendly Islands, between 200 and 300 miles to the south-east; they are about 700 miles from the French colony of New Caledonia, 1100 miles from Auckland in New Zealand, 1700 from Sydney in New South Wales, 1800 from Tahiti, and 4700 from the great American port of San Francisco. They have mail communication with Auckland once a month, and with Sydney on an average once a fortnight. The island of Rotumah, about 250 miles distant, a little to the west of north, has been since 1881 included in the colony.

The islands were sighted in 1643 by Tasman, the great Dutch sailor, whose name is borne by Tasmania. Turtle Island (or Vatoa), in the extreme south-east of the group, was discovered and so named by Captain Cook in 1773; but, like most of the South Sea islands, the Fiji Archipelago was little known before the 19th century. Since that date its history has been the not uncommon one of native discursions, gradual European intrusion, and finally European protection. In 1804 some escaped prisoners from Australia are said to have settled in the islands. In 1835 Wesleyan

tive advantages as a naval and coaling station and as a place for cotton-growing. On his advice the offer of sovereignty was in 1862 rejected. The following years brought a considerable increase to the white population of the islands, cotton-planting being stimulated by the American civil war. About 1868 a company was formed in Australia, under the name of the Polynesia Company, to take over Thakombau's debt, and with it the 200,000 acres referred to above. In 1871 a kind of constitutional government was set up by the European advisers of King Thakombau, but the cession of the islands to Great Britain was again pressed on, and, after further inquiry in 1873, Sir Hercules Robinson, then governor of New South Wales, was sent to Fiji, and on the 10th of October 1874 formally accepted the sovereignty of the group on behalf of the British crown.

Fiji was constituted and remains a crown colony, with a governor (who is also high-commissioner for the Western Pacific), an executive council, and a legislative council, composed, in addition to the governor, of six official and six nominated unofficial members. The natives are organised in village, district, and provincial councils (the colony being divided into fourteen provinces), and have a special system of taxes, paid mainly in kind.

The Fiji Islands, over 200 in number, lie in a ring, open on the southern side. The configuration of the group is not unlike that of the West Indies. On the west and north are the two large islands of Viti Levu and Vanua Levu, with a group of small islands and reefs outside them; and on the east there is a long string of islands of small size, answering to the Leeward and Windward groups in the West Indies.

The total area of the colony (including Rotumah) is given at 7435 sq. m., being about the same size as Wales. The area of Viti Levu is over 4000 sq. m., rather smaller than Jamaica, and the area of Vanua Levu is about 2400 sq. m. Since 1882 the capital of the colony has been Suva, on the south coast of Viti Levu, where there is a fine harbour; before that date Levuka, on the little island of Ovalau, off the east coast of Viti Levu, also possessing a good harbour, was the European capital. Municipalities have been established at both places.

The Fiji Islands are of volcanic formation, the shape of the mountains (the highest of which rise to some 4500 feet) and the existence of hot springs testifying to volcanic agency; and they are surrounded by coral reefs, which act as natural breakwaters. They are singularly favoured by nature, being well supplied with harbours, and equally well with rivers, having an abundant water-supply, a rich soil, and a climate which, though tropical and somewhat enervating to Europeans (who are subject to dysentery), is not unhealthy or extreme. They suffer, however, from the ravages of hurricanes, and earthquakes occasionally occur. In 1887 at Suva the shade temperature varied from a maximum of 90° in November and January to a minimum of 62° in August, and the rainfall was about 100 inches. The rainfall is greatest and the land is most heavily timbered on the south-eastern—the windward—side of the islands; on the leeward side the face of the country is more that of open grass-land. With the exception of the bêche

missionaries first came over from Tonga to begin their wonderful work of conversion to Christianity; and trade, which had begun with dealings in such articles as bêche de mer and sandalwood, gradually led to a small white settlement.

In 1849 some damage was done to the property of the American consul; a heavy claim was in consequence preferred by the United States government against the leading chief Thakombau, which he was wholly unable to meet, and in 1853 he offered the sovereignty of the islands to Great Britain, on condition that he retained his rank and that his debt was paid. As a set-off to the payment he offered to make over, if required, to the British government the ownership in fee simple of 200,000 acres of land. Upon receipt of this offer

bananas, bread-fruit, &c., and in addition to the cocoa-nut palms, the vegetable products of the islands include sugar, grown with the help of imported Indian and Polynesian labour, maize, cotton, tea, and coffee. There are hardly any indigenous animals in the islands, and but scanty signs of mineral wealth.

The population of Fiji was estimated in 1887 at about 125,000, of whom over 2000 were Europeans, and over 110,000 native Fijians. The native population is said to have been larger in former years, and was certainly reduced by the outbreak of measles in 1875. The death-rate among the natives is high, an average of some years showing a rate per 1000 nearly double that of England and Wales. They are in race akin to the Papuans, being the easternmost members of that family, but an admixture of the lighter Polynesians has been brought in from Tonga and elsewhere, and has, especially in the eastern islands of the group, leavened the native Melanesian breed. The Fijians were, prior to the introduction of Christianity, notoriously ferocious cannibals, but religious after their kind, and possessing a strong belief in a future life. At the present time the Christian religion is almost universal in the islands, the adherents of the Wesleyans being estimated at over 100,000, and of the Roman Catholics at more than 10,000. Education is mainly carried on in the mission schools, with the assistance of grants in aid from government; at Suva and Levuka there are school boards, and in Vanua Levu a government industrial school. Fiji has not prospered financially of late years, and the revenue, derived mainly from customs duties and native taxation, has not covered the expenditure. In 1882 the revenue was £111,314; in 1887 only £64,916. Sugar, in spite of the depression of the industry, is far the most important export, and next to it in value come cocoa-nuts (mainly in the dried form known as copra) and fruit. The export of cotton has greatly diminished, but that of tea in 1887 showed a large increase. The total annual exports have during the decade 1877-1887 fluctuated from £170,000 to £331,000; the imports from £311,000 to £802,000. The trade of the colony, both import and export, is almost entirely with New South Wales, New Zealand, and Victoria in the order given. Fiji has become British by the force of circumstances, and not on account of its natural advantages; but it has considerable agricultural resources, it is a station from which British influence can be exercised in the South Pacific, and its excellent harbours might possibly be more utilised in the event of the Panama Canal being successfully carried out, as the islands lie not very far out of the direct route between Australia and Central America.

A good short account of Fiji, with a map, is given in the annual Colonial Office List, and much information will be gained from a blue-book presented to parliament in 1862, which gives both Col. Smythe's Report on the islands (with maps) and also the very valuable 'Report on the Vegetable Productions and Resources of the Vitian or Fijian Islands,' by Dr Seeman, who accompanied Col. Smythe on his visit. Miss Gordon Cumming's *At Home in Fiji* (1881) is but one out of several books on the colony.

**Filament**, in Botany, is the stalk of the stamen which supports the pollen-containing *anther*, and stands to this as *petiole* to *leaf-blade*. See FLOWER, LEAF.

**Filaria**. See GUINEA-WORM.

**Filbert**. See HAZEL.

**Fildes**, S. LUKE, figure-painter, was born in 1844, a native of Lancashire. He studied in the South Kensington Schools, and in the Royal

and *The Graphic*, and illustrating Dickens's *Edwin Drood*. He began to exhibit in the Royal Academy in 1868, with his 'Nightfall,' and in 1874 he produced a very popular picture, 'Applicants for Admission to a Casual Ward'—originally a *Graphic* woodcut, followed in 1877 by the powerful and pathetic 'Widower.' His more recent subjects have been portraits and figure-pictures of Venetian life, in which he has developed a stronger colour-sense than his earlier works gave any indication of. He was elected an A.R.A. in 1879, and an R.A. in 1887.

**File**. A file is a steel tool, having its surface covered with teeth or serratures, and used for smoothing and shaping metals and other hard substances. Files are classified and named according to their shape, size, and fineness of cut, and the purpose for which they are made. Thus, in shape they may be flat, square, round or *rat-tail*, triangular, half-round, feather-edged, &c., besides being variously bent, in order to get at intricate work. Most files are made thicker in the middle, or 'bellied,' a form which best suits the hands in the act of filing. Files generally are made of the best crucible steel, the forged and shaped blanks when ready for cutting being held upon an anvil by means of a long loop of leather-strap, into which the cutter places his foot. The face of the anvil is covered with a flat piece of pewter, the softness of which preserves the teeth on one side of the file when those on the opposite face are being struck. The cutter forms the teeth by striking with a hammer a short, stout chisel, held obliquely at an angle of about 12° or 14° from the perpendicular. If the chisel were perpendicular, a furrow like the letter V would be indented, and an equal burr struck up on each side; but as a cutting tooth somewhat like that of a saw is required, this is effected by the oblique stroke of the chisel, by which a burr is thrown up on one side only—viz. towards the tang. The cutting is commenced at the point of the file; the chisel is then drawn backwards, laid upon the blank, and slid forwards till it reaches the burr raised by the last cut; the blow is now struck, and another tooth and burr produced, which serves as a guide for the next cut; and so on. The distance between the teeth thus depends on the force of the blow and the obliquity of the cut; for the heavier the blow, the greater the ridge or burr, and the obliquity determines the distance of the cut from the burr. The skill of the workman consists, therefore, in the precise regulation of the blows.

Files are either single cut—i.e. made with a single series of parallel cuts—or, more commonly, double cut—i.e. they have two series or *courses* of chisel-cuts, which are oppositely inclined at an angle of about 55° to the central line of the file. The second course is made in the same manner as the first, but with lighter blows, and is usually somewhat finer than the first. This angular crossing converts the ridges into pointed teeth. Files used for soft metals which are liable to clog the teeth are single cut—i.e. they have but one course of cuts. Taper files have the teeth finer towards the point. Rasps for wood or horn, &c. are cut with triangular punchers, each tooth being an angular pit with a strong burr, instead of a long furrow. The rapidity with which the blows are struck varies with the fineness of the file: sixty or eighty cuts are commonly made per minute. Classified according to fineness of cut, files are known as rough, bastard, smooth, and superfine. A superfine file of small size may have as many as 916 cuts per inch, while a large rough file may

improved by subjecting them after cutting to a sand-blast, whereby a slight recurvature of the burr, which is always present as the file leaves the cutter, is corrected, and the edge is rendered very keen.

Files have to be very carefully hardened and tempered. If heated too strongly, or made too hard, the steel is so brittle that the teeth tear off; if too soft, they wear down rapidly, and the file soon becomes useless. Great care is also required in keeping them straight, as the sudden cooling necessary for hardening is very apt to warp the steel.

Many attempts have been made to cut files by machinery, but with only partial success; the chief difficulty arises from the necessity of modifying the force of the blow to suit the hardness of the steel. It is practically impossible to supply a large number of blanks all of exactly the same hardness; and if the machine be adjusted to suit the hardness of one blank, it may strike too heavy or too light a blow for the next; whereas the workman feels at once the hardness of the steel he is working upon, and adjusts his blows accordingly.

**File** (Fr. *file*, 'a row,' from Lat. *filum*; Ital. *fila*, *filo*), in a military sense, is used to signify any line of men standing directly behind each other, as rank refers to men standing beside one another. In ordinary two-deep formations, a file consists of two men, one in the front rank and one in the rear rank. *Single-file* formation signifies one man from a single rank followed by the men on his right (or left) in succession. *Rank and file* is a term often used to mean the private soldiers of a regiment only, but it really includes also the corporals, who are therefore sometimes called rank and file non-commissioned officers.

**File-fish.** See BALISTES.

**Filey**, a rising watering-place on the east coast of Yorkshire, 9 miles SE. of Scarborough by rail, occupies a picturesque site on cliffs overlooking Filey Bay. It has a spa, and an ancient cruciform church. In 1883 a committee reported in favour of Filey as a harbour of refuge. Pop. (1851) 1511; (1881) 2337, engaged mainly in fishing.

**Filiation.** See AFFILIATION.

**Filibusters** (Span. *filibuster*, from *filibote* or *filibote*, itself derived from the Eng. *fly-boat*, a fast-sailing vessel of not more than 100 tons; by others referred, through the Fr. *filibustier*, formerly *fribustier*, to the Dutch *wijbouter*, 'freebooter'), another name for Buccaneers (q.v.). In more recent usage the term has been employed to designate certain lawless adventurers belonging to the United States, who have attempted violently to possess themselves of various countries of Spanish America. The plea urged by these men has generally been that such countries were a prey to anarchy and oppression, and could only attain to prosperity by annexation to the United States. The most noted of these filibusters was William Walker (q.v.).

**Filicain**, VINCENZO, lyrical poet, was born at Florence, 30th December 1642. The publication of his six odes celebrating the deliverance of Vienna in 1683 by John Sobieski from the besieging forces of the Turks attracted the notice of Queen Christina of Sweden, who relieved him from harassing pecuniary embarrassments. Ultimately he obtained a post from the Grand-duke of Tuscany, and he died at Florence, 25th September 1707. Some of his patriotic sonnets are famous; but his verse, though not without beauty and spirit, is disfigured by the rhetorical tricks and false conceits of the period. An edition of his works appeared at Florence in 1864.

**Filices.** See FERNS.

**Filigree** (through Span. from Lat. *filum*, 'a thread,' and *granum*, 'a grain'), so called because composed of fine wire of silver or gold, often ornamented with small beads. The wire used is twisted into spirals and other convoluted forms, which are united and partly consolidated by soldering; and these spirals, &c. are combined to form a sort of metallic lace-work, which is shaped into brooches, ear-rings, crosses, head-ornaments, card-cases, trays, and other objects of a light and elegant character. Filigree-work is also employed for the ornamentation of articles having a solid metallic base of precious metal, or of copper, the wires being soldered down in definite patterns to the supporting plate. That filigree, as a style of jeweller's work, is of great antiquity is evidenced by remains found in ancient Egyptian tombs. That a knowledge of the art was very widespread is also manifest from the fact that it was largely practised by the ancient Greeks, the Etruscans, and the Romans. We know further that from remote ages it was practised in Central Asia and in India, where to this day it has continued in unbroken succession, and it is now a most characteristic style of work in the Central and North-west Provinces. Among the Celtic and Scandinavian tribes of early times filigree was also a favourite method of ornamentation. The Quigrich (see FILLAN, ST), and the Munster Brooch (see BROOCH) are magnificent examples of early northern metal-work in which filigree ornamentation on a solid basis is a prominent feature. In the jewelry of the Scandinavian races filigree still occupies an important place. The manufacture of filigree jewelry is so characteristic of Malta that the style has come to be popularly known as Maltese work.

**Filioque.** See CREEDS.

**Fillan**, ST, was the son of Feredach, a prince of Munster, and of St Kentigerna, who in 734 died on Incheallach in Loch Lomond. He succeeded St Mund as abbot of the monastery on the Holy Loch, but presently withdrew to Upper Glendochart (Strathfillan), 3 miles SSE. of Tyndrum, where he died on 9th January 777. In 1818 Robert Bruce re-established here an Augustinian priory; and here too was the 'holy pool of Fillan,' in which, not a century since, sick people bathed, and lunatics were plunged. The latter were afterwards left all night, bound hand and foot, in a stone coffin; and if in the morning the knots were untied there was hope of recovery. Two relics of the saint have, after strange wanderings, been reunited at Edinburgh in the Antiquarian Museum. One, his square-shaped bell of cast bronze, 12 inches high, lay in the churchyard, and was employed in that innatic 'repo-trick,' till in 1798 an English tourist bore it off to Hertfordshire, whence in 1869 it was recovered through Bishop Forbes of Brechin. The other relic is the Quigrich (Gael. *coggerach*, 'stranger')—the bronze head of a pastoral staff (fig. 1), adorned with niello, and inclosed in a beautiful outer case of silver (fig. 2), 9 inches high, gilt, and ornamented with chased work and filigree. Both are undoubtedly of Celtic workmanship; but the case is naturally the later of the two, and seems partly assignable to the 14th and 15th centuries. Possessed of both thief-

Fig. 1.—Quigrich of St Fillan.

Two relics of the saint have, after strange wanderings, been reunited at Edinburgh in the Antiquarian Museum. One, his square-shaped bell of cast bronze, 12 inches high, lay in the churchyard, and was employed in that innatic 'repo-trick,' till in 1798 an English tourist bore it off to Hertfordshire, whence in 1869 it was recovered through Bishop Forbes of Brechin. The other relic is the Quigrich (Gael. *coggerach*, 'stranger')—the bronze head of a pastoral staff (fig. 1), adorned with niello, and inclosed in a beautiful outer case of silver (fig. 2), 9 inches high, gilt, and ornamented with chased work and filigree. Both are undoubtedly of Celtic workmanship; but the case is naturally the later of the two, and seems partly assignable to the 14th and 15th centuries. Possessed of both thief-

finding and healing properties, the Quigrich from Bruce's time and earlier was

antiquaries. St Fillans, at the foot of Loch Earn, is associated with an earlier saint, called *an Iobar*, 'the leper,' whose feast fell on 20th June. See Dr John Stuart's 'Historical Notices of St Fillan's Crozier,' in *Proc. Soc. Ant. Scot.* (xii, 1877), and Dr Joseph Anderson's *Scotland in Early Christian Times* (i, 1881).

**Fillet**, in Architecture, a small space or band, like a narrow ribbon, used along with mouldings.

a, a, a (see fig.) are examples of fillets, both in classic and Gothic architecture.

**Fillmore**, MILLARD, thirteenth president of the United States, was born on 7th February 1800, at Summer Hill, New York, where his education was limited to the very imperfect instruction furnished during three months of the year by a primitive frontier school. At the age of fourteen he was bound apprentice to a wool-carder; and during the five years he laboured at this occupation he used every means at his disposal to cultivate his mind. In 1819 he began the study of law, receiving his board in return for his work in the office of a country lawyer; and during part of this time he also taught school, until in 1823 he was admitted to the Buffalo bar, where he built up a solid reputation for sound legal knowledge and sterling probity. In 1828 he began his political career, being in that year returned by Erie county to the state legislature of New York, where he joined the Whig party, and was mainly instrumental in procuring the abolition of imprisonment for debt in the state of New York. In the period 1832-42 he was four times elected member of congress; in 1844 he was defeated in a contest for the governorship of the state; in 1847 he was elected to the post of comptroller of New York; and in the following year he was made vice-president of the United States. The unexpected death of President Taylor in July 1850 left the chief magistracy vacant, and Fillmore succeeded to that office, which he held till 1853. He proved an able statesman, and his presidency was marked by the passing of some very salutary measures, notwithstanding that his party were in the minority; but his signing of and attempt to enforce the fugitive-slave law rendered him unpopular in the North. In 1856 he was nominated for the presidency by the American party, but the struggle lay be-

tween the republican and the democratic candidates, and he received the electoral vote of Maryland only. He visited Europe in 1855 and 1866. He took no active part in the civil war, although he gave his influence to the cause of the Union. After his retirement from political life he resided at Buffalo, where he died 7th March 1874. See Chamberlain's *Biography of Fillmore* (1856), and the article by General James Grant Wilson in *Appleton's Cyclo. of Amer. Biog.* (1887).

**Filmer**, SIR ROBERT, an extreme advocate of the theory of the divine right of kings, was born at East Sutton in Kent, in the end of the 16th century. He matriculated at Cambridge in 1604, and died probably in 1653. The germ of his theory is the proposition that the father of a family is the divinely ordained type of a ruler, and that his power is absolute. Accordingly, Filmer taught, a king's acts should be subject to no check or control whatsoever; his will is the only right source of law. Hence he is not in any sense answerable to his subjects for his doings; for them either to depose him or even to criticise his conduct is criminal and immoral. These views are expounded with most fullness in his *Patriarcha*, published after his death in 1680, and were critically examined in Locke's *Treatise on Government*. Filmer's *Freholder's Grand Inquest* (1648) is an exposition of his ideas as to the relations that ought to obtain between the king and the houses of parliament. See DIVINE RIGHT.

**Filmy Ferns** (*Hymenophyllaceae*), an order of Ferns (q.v.), including only three genera, but as many as two hundred species. They grow in large, spreading, mossy masses on rocks and tree-stems in moist places, are chiefly tropical, rare in the southern hemisphere, still rarer in the northern. The only British species of the large genus *Hymenophyllum* (*H. tunbridgense*), despite its apparently local name, is one of the most widely distributed of plants, being found not only over Europe, but in South America, at the Cape, and in New Zealand. *Trichomanes* has ninety species, mostly tropical, only one ranging as far as southern Europe. Although chiefly distinguished by systematists on account of the minute structure of their sporangia, they are more remarkable for the exceptionally simple structure of their moss-like leaves, which consist usually of only a single layer of uniform parenchymatous cells. More rarely several layers are present, but there is never a distinct epidermis; moreover, as the plants grow in very wet places—often, for instance, in the spray of waterfalls—and as the leaves are so hygroscoptic as to be constantly saturated, even when not absolutely covered with moisture, the usual air-spaces, and with them the stomata of ordinary leaves, are not developed. From this saturation with water instead of air the thin, wet, filmy foliage is thus peculiarly transparent, and so seems singularly dark-green by reflected light. To the exceptional yet beautiful appearance thus accounted for their interest to fern-growers is due.

**Filter**. When solid matter is suspended in a liquid in which it is insoluble, it may be separated by various means (see CLARIFICATION), one of which is filtration. The process of filtration consists in passing the liquid through some porous substance, the interstices of which are too small to admit of the passage of the solid particles, the principle of the action being the same as that of a sieve. One of the simplest forms of filter is that commonly used in chemical laboratories for separating precipitates, &c. A square or circular piece of blotting-paper is folded in four, the corner where the four folds meet is placed downwards in a

funnel, and one side is partly opened, so that the paper forms a lining to the funnel. The liquid passes through the pores of the paper, and the solid matter rests upon it. The chief advantages of this filter are its simplicity and the ease with which the solid matter may be removed and examined.

A simple water-filter for domestic purposes is sometimes made by stuffing a piece of sponge in the bottom of a funnel or the hole of a flower-pot, and then placing above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal, to prevent it from being stirred up when the water is poured in. It is obvious that such a filter will require occasional cleaning, and renewal of the charcoal. By a small addition to this a cottage-filter may be made which, for practical use, is quite equal to the most expensive filters of corresponding size. It consists of two flower-pots, one above the other; the lower one is fitted with the sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the larger, and, if the lower one is strong, the upper one may stand in it. The two pots thus arranged are placed upon a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, its sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for a long period without being renewed, if the upper sponge be occasionally cleaned. Care must be taken to wedge the upper sponge tightly enough, to prevent the water passing from the upper pot more rapidly than it can filter through the lower one.

A great variety of filters are made on a similar principle to the above, but constructed of ornamental earthenware or porcelain vessels of suitable shape. In purchasing a filter, the buyer must not be satisfied with merely seeing that the water which has passed through it is rendered perfectly transparent—this is so easily done by a new and clean filter—but he should see that the filter is so constructed as to admit of being readily cleansed, for the residual matter must lodge somewhere, and must be somehow removed. When large quantities of water have to be filtered this becomes a serious

Leloge's Filter:

1, 2, 3, 4, the four compartments; *ab*, the first porous stone of third or filtering compartment; *cd*, the exit filtering stone of *d*; *e*, the plug to remove for cleaning out second compartment; *f*, a loose sponge at entrance of communicating tube.

covered with another plate of porous stone. The fourth compartment, immediately above the third, receives the filtered water, which has been forced through the lower stone, the charcoal, and the

upper stone. A tap is affixed to this, to draw off the filtered water, and a plug to the second or lowest compartment, to remove the sediment.

A large number of other ascending filters have been patented. Siphon filters are cylindrical pewter vessels, containing the filtering media, to which is attached a long coil of flexible pipe. When used, the cylinder is immersed in the water-butt or cistern, the pipe uncoiled, bent over the edge of the cistern, and brought down considerably below the level of the water. It is then started by applying the mouth to the lower end, and sucking it till the water begins to flow, after which it continues to do so, and keeps up a large supply of clear water. This, of course, is an ascending filter, and the upward pressure is proportionate to the difference between the height of the water in the cistern and that of the lower end of the exit tube (see *SIPHON*). Filtering on a large scale is effected by using several tanks or reservoirs, in the first of which is coarse material such as gravel, the water passing from this to a second, and from there through a finer filter to the main receptacle, where the filtered water is stored and drawn off for use.

A common water-butt or cistern may be made to filter the water it receives by the following means: Divide the cistern or butt into two compartments, an upper and a lower, by means of a watertight partition or false bottom; then take a wooden box or small barrel, and perforate it closely with holes; fit a tube into it, reaching to about the middle of the inside, and projecting outside a little distance; fill the box or barrel with powdered charcoal, tightly rammed, and cover it with a bag of felt; then fit the projecting part of the tube into the middle of the false bottom.

Various means of compressing carbon into solid porous masses have been patented, and filters are made in which the water passes through blocks of this compressed carbon. Most of these are well adapted for the purpose, but their asserted superiority over filters composed of layers of sand and charcoal is doubtful. A very elegant and convenient portable filter for soldiers, travellers, and others who may require to drink from turbid ponds and rivers is constructed of Ranome's filtering-stone, and is also made of the compressed carbon. A small cylinder of the stone or carbon is connected with a flexible india-rubber tube in such a manner that the cylinder may be immersed in a river, the mouth applied to a mouthpiece at the other end of the tube, and the water drawn through the filtering-cylinder.

It has been questioned whether soluble matter, such as common salt, is in any degree removed from water by filtration. Theoretically it was assumed that this is impossible, since the filter only acts mechanically in stopping suspended particles; but the results of experiments show that from 5 to 15 per cent. of the soluble salts were separated by sand-filters such as above described. Another most important matter is to ascertain to what extent soluble organic matter may be decomposed by filtration, especially by charcoal filters, and to ascertain how long charcoal and other porous matter retains its property of acting on organic matter in watery solution (see *CHARCOAL*). This is of the highest importance, as it sometimes happens that water of brilliant transparency, and most pleasant to drink, on account of the carbonic acid it contains, is charged with such an amount of poisonous organic matter as to render its use as a daily beverage very dangerous. A filter of animal charcoal will render London porter colourless. Loam and clay have similar properties. The separation from drinking-water of pathogenic microbes (microscopic sources of pestilence) and their germs is very

difficult, on account of their extreme smallness; but it has been effected by using porous unglazed earthenware as the filtering medium. It is, however, rather troublesome in practice, as pressure is demanded, and the very fine pores are soon clogged. They may be cleansed by raising the filter material to a red heat. A duplicate is therefore required.

When a liquid contains unelaginons or other matter having viscous properties, there is considerable difficulty in filtering it, as the pores of the medium become filled up and made watertight. Special filters are therefore required for syrups, oils, &c. Such liquids as ale, beer, &c. would be exceedingly difficult to filter, and therefore they are clarified by the admixture of albumen, gelatin, or some substance with clarifying properties. Oil is usually passed through bags made of horse-hair or twilled cotton cloth (Canton flannel). Syrups are filtered on a small scale by confectioners, &c. by passing them through conical flannel bags, and on a large scale in *creased bag-filters*, made by enclosing a large bag within a smaller one. Thick syrups have to be diluted or clarified with white of egg, to collect the sediment into masses, and then they may be filtered through a coarse cloth strainer. Vegetable juices generally require to be treated in this manner. See BEER, WINE, SUGAR, &c.; and for filtering on the large scale, see WATER-SUPPLY.

The simple laboratory filter has to be modified when strong acid or alkaline solutions, or substances which are decomposed by organic matter, require filtration. Pure siliceous sand, a plug of asbestos, pounded glass, or clean charcoal are used for this purpose. Some recommend gun-cotton as a filter for such purposes.

**Air Filters.**—The extraordinary powers of charcoal in disinfecting the gaseous products evolved from decomposing animal and vegetable matter have been made available in constructing an apparatus for purifying air that is made to pass through it. A suitable cage, containing charcoal in small fragments, is fitted to the opening from which the deleterious gases issue, and is found to render them perfectly inodorous, and probably innocuous. Mechanical impurities suspended in air may be filtered out by forcing the air through a plug of cotton-wool, as in firemen's respirators.

**Fin.** See FINS.

**Finale**, the name given to that part of a musical composition which finishes the act of an opera; also to the last movement of an instrumental composition, as in the symphony, quartette, quintette, sonata, &c. The instrumental finale varies greatly in form, from the lively rondos of Haydn to the gigantic vocal finale, in variation form, of Beethoven's 9th Symphony. The operatic finale, as usually understood, is a concerted piece, sometimes extending to a considerable number of different movements, for one, two, or more single voices, with or without chorus. The best type is to be found in Mozart's operas. In Wagner's works there are no finales separable from the preceding parts of the acts; each act is a continuous whole.

**Finance.** See NATIONAL DEBT, BUDGET, &c.

**Finch**, a name applied to many Passerine birds included in the family Fringillidae, but generally used with some affix, as in the familiar names bullfinch, chaffinch, and goldfinch. A finch is usually small, has a hard conical beak, and generally lives upon seeds. The distribution is almost world-wide, excepting Australia; but the majority inhabit the palearctic region. The Buntings (Emberizidae) and the Weaver-finches (Ploceidae) of the Ethiopian and Australian regions are usually kept distinct. The limits of the family Fringillidae are vague; among the more familiar members are the

Chaffinch (*Fringilla coelebs*), the Brambling (*F. montifringilla*), the Canary (*Serinus*), the Crossbills (*Loxia*), the Linnets (*Linota*), and the Sparrows (*Passer*).

**Finch**, HENEAGE, first Earl of Nottingham and Lord Chancellor of England, was born in Kent, probably at Eastwell, on 23d December 1621. He was the nephew of Finch, the lord-keeper of Charles I. Educated at Westminster and Christ Church, Oxford, he was called to the bar in 1645. At the Restoration Charles II. made Finch solicitor-general; in this capacity he took an active part in the trial of the regicides, publishing an account of the trial in 1660. In 1670 he became attorney-general, and five years later lord chancellor. As high steward he presided at the impeachment trial of Stafford in 1680. He died in London, 18th December 1682, having gained a high reputation as a graceful orator, and as a lawyer of great integrity, wisdom, and skill. Several of his speeches were published during his lifetime.

**Findhorn**, a beautiful Scottish river, rising among the Monadhliath Mountains at an altitude of 2800 feet, and running 62 miles north-eastward through the counties of Inverness, Nairn, and Elgin, and past the town of Forres, till it enters the Moray Firth at Findhorn village by a triangular lagoon, 2 miles long by 2½ wide. Its waters abound in salmon and trout. Its basin consists of gneiss in the upper part, and of old red sandstone in the lower. At one place it rose nearly 50 feet in the disastrous floods of August 1829, known as the 'Moray Floods.'

**Finding of Goods.** See LOST PROPERTY.

**Findlater**, ANDREW, editor of the first edition of this Encyclopedia, was born in December 1810 near Aberdour, in Aberdeenshire. He was the son of a small farmer, and was bred to farm-work; but he early resolved to go to the university, and in spite of having to do daily a full day's work on the farm, he contrived to qualify himself for entering Aberdeen University. There he graduated in arts, and began theology with a view to becoming a minister; but changing his intention, became a schoolmaster at Tillydesk in the parish of Ellon, and for seven years (1842-49) was head-master of Gordon's Hospital in Aberdeen. After a short residence in Canada, he came in 1853 to Edinburgh to superintend for Messrs W. & R. Chambers a new edition of the *Information for the People* (1857). His next task was the chief work of his life; he devoted himself to the preparation of *Chambers's Encyclopedia*, and ere long was its editor. A scholar of wide and varied learning, equally at home in the physical sciences, in the history of ancient religions, and in modern comparative philology, he turned his acquirements to good account, not merely in directing the *Encyclopaedia* as a whole and fixing its form and scope, but in contributing to it many of its most important articles; and after its completion (1861-68) he superintended a revised issue (1874). He saw through the press a new edition of the *Miscellany* (1869-71) and of the *Etymological Dictionary* (1882); and wrote short but admirable manuals on Astronomy, Language, Physical Geography, and Physiography. In 1864 Aberdeen University gave him its degree of LL.D.; and J. S. Mill, while rector of St Andrews University, made him his assessor in the University Court. Many of the articles in the review columns of the *Scotsman* were from his pen. He was associated with J. S. Mill, Mr Grote, and Professor Bain in editing James Mill's *Analysis of the Phenomena of the Human Mind* (1869); and he counted Thackeray, Littré, and Dr John Brown amongst his friends. His health failing, he withdrew from active work in 1877, and died 1st January 1885.

**Findlay**, capital of Hancock county, Ohio, 37 miles SW. of Fremont by rail, with several foundries, flour-mills, sawmills, &c. Pop. 4633.

**Findon**, a fishing-village of Kincardineshire, on the coast, 6 miles S. of Aberdeen. Pop. 156. The well-known *Findon (Finnan) haddocks* were first cured here.

**Finds.** See TREASURE-TROVE.

**Fine of Lands**, in England, fictitious proceedings formerly in common use in order to transfer or secure real property by a mode more efficacious than an ordinary conveyance. The proceedings in a fine were shortly as follow: The party to whom the land was to be conveyed commenced a fictitious suit against the vendor. Leave to compromise the suit having been obtained, a covenant was entered into whereby the vendor or defendant, called the *cognizor*, recognised the right of the plaintiff, called the *cognizee*, to the lands, of which he admitted that the plaintiff was wrongfully kept from the possession. A note of the fine was entered on the rolls of the court; and the business was concluded by what was called the *foot of the fine*, settling forth the parties, the time and place of agreement, and before whom the fine was levied. The whole was embodied in indentures commencing *hæc est finis concordia*. In order that a fine should have full effect, it required to be levied with *proclamations*—i.e. open proclamation of the transaction in court. A fine levied by a married woman had the effect of cutting off all right she might have in the lands, and was the only mode by which a married woman could convey lands; and in order to protect her from undue influence she was privately examined as to the voluntary nature of the transaction. A fine was also in use as one of the methods of barring an Entail (q.v.). The Fines and Recoveries Act of 1833 substituted a disentailing deed for the numerous methods formerly employed; the same act enabled a married woman to convey lands by means of a deed acknowledged with certain forms. The 'feet' of old fines are often of great importance as evidence in regard to questions of pedigree and title to property. The statute *De Donis* prohibited fines as a means of barring entails.

**Fingal's Cave.** See STAFFA.—For Fingal himself, see FENLANS, OSLIAN.

**Finger-and-toe.** See ANBURY.

**Fingers.** See HAND.

**Fingos**, or AMAFNGU, a Bantu people in the south-east of Cape Colony, closely akin to the Kaffirs (q.v.).

**Finial**, an ornament, generally carved to resemble foliage, which forms the termination of pinnacles, gables, spires, and other portions of Gothic architecture. There are traces of foliated terminations, both in stone and metal, on the pediments of classic buildings (see ACROTERRON), but it was not till the 12th century that the finial proper was introduced. During the latter part of that century and the whole of the 13th century, finials of the most perfect form and of infinite variety were used as the crowning ornaments of every salient point in the buildings of the period (see fig. 1). The architects of the 14th century in finials, as in other ornaments, imitated more closely the forms of natural foliage; but their finials had neither the variety of design nor the vigour of outline of those of the preceding century (see fig. 2).

In the 15th and 16th centuries the finials became more and more meagre in form, and are frequently only four crockets set upon a bare pyramidal terminal. Some variety of effect is often obtained during this period by surmounting the finial with a gilded vane. This is common in Tudor and in continental domestic architecture (fig. 3). Finials

were carved both in stone and wood, and in the latter material with great delicacy and minuteness. In connection with metal-work finials of metal were used, and, whatever the material adopted, its natural capabilities were made a source of special beauty.

The finial is one of the most effective ornaments of Gothic architecture, and when that style was succeeded by the Renaissance, in the reign of Queen Elizabeth, our forefathers could not persuade themselves to part with the finials to their buildings.

Finials:

1, from Bishop Bridport's Monument, Salisbury Cathedral; 2, York Minster; 3, Marlborough, Germany; 4, Crew Hall, Cheshire; 5, Augsburg.

We thus find in Elizabethan architecture a great variety of finials; they are, however, almost entirely of a geometric form, and without foliage (fig. 4), and are frequently, especially when terminating wooden gables, combinations of finial and vane, partly wood and partly iron (fig. 5). In the stricter classic style which succeeded the Elizabethan, some traces of the favourite finial still remain in the balls, obelisks, &c. used as terminations, and also in the shields and supporters (themselves a remnant of feudal times) which form the crowning ornament of gate-piers, pedestals, &c.

**Fining**, the process of clearing turbid liquors, such as beer and wine. See CLARIFICATION, BEER, WINE, SUGAR, FILTER, &c.

**Finistère** (Lat. *finis terræ*, 'land's end'), a department at the western extremity of France, comprehending a part of the former duchy of Bretagne, and washed on three sides by the English Channel and the ocean. Area, 2585 sq. m. Pop. (1872) 642,963; (1886) 707,820. It is traversed from east to west by two low but picturesque chains of hills, clad with fir-trees and heath, and forming fruitful valleys of meadow-land between. Its coast is very rugged and broken, its shores bristling with dangerous granite rocks, and fringed with many islands. The most dreaded headland is the Pointe de Raz, rising over 200 feet above the sea, near which, in the 16th century, were still visible the ruins of Is, the ancient capital of Cornouille (q.v.). The temperature in general is low, the climate very humid; rain and mist are of almost daily occurrence. There are a number of coast streams, including the Odet, the Elorn, and the Aune, which forms part of the great line of communication between Brest and Nantes. The department raises more grain than even its dense population can consume, and vegetables, flax, and cider also are exported; it is noted for its small, hardy horses;

and cattle, swine, and bees are largely reared. Its argentiferous lead-mines are no longer worked, and its manufactures, which include rope-spinning, weaving, and some shipbuilding, are of little importance; its sardine-fisheries, however, employ over 7000 hands. The department is divided into live arrondissements—Brest, Châteaulin, Morlaix, Quimper, and Quimperlé—with Quimper as chief town. See BRITANY.

**Finisterre**, CAPE, a promontory at the north-western extremity of Spain, off which Anson (q.v.) defeated Jomquiere, and Sir Robert Calder cut off two vessels of the Franco-Spanish fleet in 1805.

**Finland** (Finnish *Suomi* or *Suomenmaa*, 'the land of fens and lakes'), a grand-duchy annexed to Russia in 1809, though politically a part of that country, is an independent state from an administrative point of view. Finland lies between 60° and 70° N. lat., and 20° and 32° E. long., and is bounded on the N. by Norway, on the E. by the Russian governments of Archangel and Olonetz, on the W. by the Gulf of Bothnia, and on the S. by the Gulf of Finland. Its greatest length is 717 miles, its average breadth about 185 miles. The population of the grand-duchy, which was less than 1,000,000 at the time of the annexation, rose to 1,636,915 in 1850, and to 2,232,378 in 1887, of which number about 85 per cent. are of the native Finnish race, 12 per cent. Scandinavians (i.e. descendants of the Swedes who governed the country or settled in it during the six and a half centuries that Finland formed an integral part of the kingdom of Sweden), the rest being Russians, Germans, and Lapps. Of the population in 1887 the great majority, or 2,189,074, were of the Lutheran state-religion, and 41,032 of the Russo-Greek faith. The inhabitants of Helsingfors, the capital (pop. 65,000), are mostly of Swedish descent, as is also the case at Åbo and all along the south and west coasts. About 80 per cent. of the inhabitants belong to the agricultural class, being for the most part peasant-proprietors, with holdings of from 10 to 30 acres. The area of Finland is nearly 145,000 sq. m. (or rather larger than Great Britain and Ireland), the surface presenting a singular aspect.

A glance at a map shows the coast to be extremely indented, and studded with thousands of small islands, forming a perfect archipelago (Swedish *skargård*), whilst the interior of the country is occupied with countless lakes, some of vast size, and mostly connected with each other naturally or artificially by means of canals. In fact, it is doubtful whether any country in the world is so well supplied with the means of inland navigation as Finland, 12 per cent. of the total area being occupied by lakes, and 15 per cent. by marsh and bog, the quantity of which latter is gradually being diminished by the united efforts of nature and man; for it has been proved by careful observation that the surface of Finland (which is a tableland from 300 to 400 feet above the level of the sea) is gradually rising from its watery bed, and that, too, in some places at a rapid rate. Thus, it has been calculated, by means of points fixed on the seashore, that on the Gulf of Bothnia the land has risen at the rate of 3 feet 1 inch in 100 years, and on the Gulf of Finland at the rate of 1 foot 11 inches. The largest of the lakes—besides Lake Ladoga, of which part belongs to Russia—are Lakes Saima, Enare, Kemi, Uleå, and Päijänne. The Saima consists of 120 large lakes and several thousand smaller ones, all connected, and having a natural outlet into Lake Ladoga, over the famous Inari Falls—more correctly rapids—the finest in Europe both from the scenery and volume of water. Lake Saima is likewise connected with

the Gulf of Finland by means of a splendid canal 36 miles long, with no less than twenty-eight locks. The canal, which took twelve years to complete, was designed and carried out by Finnish engineers at the cost of the state, and is a triumph of engineering skill, as it runs for many miles through granite rock, and there is a difference of 250 feet between the levels of the extremities. The surface of Finland consists of primitive rocks, as gneiss, granite, diorite, and gabbro. Neither fossils nor coal are found.

Finland has no mountains worthy of the name, the highest being Haldefjall, in Lapland (Lapp *Haltuschoh*), 4126 feet high, near the frontier of Norway, and really belonging to the Norwegian range. The highest hill in the south is Tiihismaa, and this does not exceed 754 feet above sea-level. The average height of the interior of Finland is about 325 feet above the level of the sea. On account of this lack of mountain-ranges, the rivers of Finland are unimportant, the principal being the Kemi and Uleå in the north, and the Kymmene in the south. They are usually navigable only for a part of their length, owing to rocks and rapids, but they are well suited for floating logs from the forests of the interior to the coasts, besides which they serve as motive power for many mills, and are also rich in fish. The forests of Finland are of vast extent, covering no less than three-fifths of the land-surface. More than half of them belong to the state; for this reason it may safely be said that Finland will never exhaust its stock of timber, as the cutting of the forests is carefully regulated; whereas private owners have hitherto distinguished themselves by a reckless and extravagant system of tree-felling. The Scotch fir (*Pinus sylvestris*) and Norway spruce (*Abies* or *Picea excelsa*) are the most widespread and most productive; then come the birch, alder, ash, oak, &c., of which the three first mentioned alone grow far north, the others being found only in the centre and south of Finland. Among the fruit-trees which have been successfully acclimatised in Finland are the apple, pear, cherry, &c., but they produce no fruit in the north of the country beyond lat. 63°; currants, raspberries, strawberries, &c. thrive almost everywhere. Of cereals, rye is the most grown, then barley, oats, and wheat; this latter, however, rarely ripens beyond lat. 61°. The potato flourishes as far north even as lat. 69°; after rye it forms the staple food of the inhabitants. The fauna of Finland is very rich. Among wild animals we find the bear, wolf, fox, lynx, ermine, otter, and hare; but the elk (*Alces*) and beaver, which were formerly abundant, are now rare. Seals are plentiful along the coast, as also in the Saima and Ladoga lakes. All domestic animals thrive in most parts of Finland, but are replaced by reindeer in the far north. Finnish horses are remarkable for their speed, hardihood, and docility. Of birds there are 211 species—not counting the domestic sorts—including ptarmigan, blackcock, moorcock, swans, geese, ducks, many varieties of birds of prey, and most of the smaller birds common in Great Britain. We find 80 species of fish in the rivers, lakes, and seas of Finland. Of these, a kind of herring (Swedish *strömming*) is very abundant on the south and south-west coasts. Salmon, trout, perch, pike, gwyniad, &c. abound in most of the rivers, and give employment to a considerable proportion of the population. Fish forms an important element in the food of all classes, large provision of the same being salted or smoked for the winter season.

The climate of Finland is very rigorous in winter, even on the south coast, where 20° and 25° below zero (Fahrenheit) are often registered; but it is generally healthy, and, owing to the proximity of the sea, it is far milder than North Russia or any

other region in the same latitude except Sweden and Norway. The summer, though short, is occasionally very hot in June and July. The ground is generally covered with snow from the middle of November till April; then follows a brief spring, accompanied by a rapid growth of vegetation. Autumn is likewise short, September being often very fine and October wet. The long summer days, when the sun only goes below the horizon for an hour or two, have a peculiar charm. At Åbo the mean temperature of the year is 40° (Fahrenheit), and at Helsingfors 39°. At the latter place February is the coldest month, with an average of 17° (Fahrenheit), and July the hottest, with 62°. In the north and north-east of Finland, of course, the winters are longer and more severe, the mercury frequently freezing in the thermometer. The annual rainfall at Helsingfors is 20 inches, the prevailing winds being south and south-east.

The emperors of Russia are at the same time grand-dukes of Finland, with considerable power, such as the right of declaring war and peace, the imposition of duties, the appointing of the senators and other high officials; nor do the various bills that pass through the House of Representatives become law till they have received the imperial sanction. The country is governed by the grand duke, the senate, and the diet (Swedish *Landtag*). The senate consists of 20 members, appointed by the grand-duke from among the Finnish subjects recommended to his imperial majesty by the governor-general of Finland, who is a Russian subject, and commands the Russian troops that garrison Sveaborg and other strong places in the grand-duchy. The diet consists of four chambers—nobles, clergy, burgesses, and peasantry; the nobles having hereditary legislative rights, whilst the others are elected by the members of their respective classes. In the session of 1888 these chambers were represented by 125 nobles, 37 clergy, 55 burgesses, and 61 peasantry. According to law the diet must meet once in five years, but of late it has been convoked every three years.

Education in Finland is in a highly advanced state, no less than 91 per cent. of the adult inhabitants being literate, whilst of the children capable of attending school only 2 per cent. are not in receipt of instruction. There is one university, at Helsingfors, with four faculties (theological, legal, medical, and philosophical) and 1002 students (1888) in residence, against a total of 411 students in 1863. There are besides 30 lycæums, 160 elementary and *real-skolor* for boys, 50 girls' schools, 4 seminaries for the training of teachers, and 929 popular schools, besides several nautical, commercial, and agricultural schools. Formerly Swedish was the official language of Finland; but since 1883 Finnish and Swedish have been placed on the same footing. At the university and the higher educational establishments Swedish is still mostly used, but in the popular schools Finnish is the medium of instruction as a rule; Russian is almost an unknown tongue in Finland.

For administrative purposes the grand-duchy is divided into 8 counties (Swedish *län*): Nyland, Åbo-Björneborg, Tavastehus, Viborg, St Michel, Knopio Vasa, and Uleåborg. Each county has a governor at its head. The courts of law are held at Åbo (the former capital), Vasa, and Viborg. The chief towns are Helsingfors (53,370 in 1886), Åbo (26,448), Tammerfors (16,744), Viborg (16,639), and Uleåborg (11,578).

The railways of Finland, which with the exception of one short line all belong to the state, show a total length already of 1112 miles, whilst other lines are in course of construction. The telegraphic department is under the control of the

Russian government; and telephones in the hands of private companies have been established throughout all the towns of the grand-duchy. In Helsingfors the telephone system has reached an astonishing development, few houses being without it.

The finances of the grand-duchy are in a most flourishing condition, and are quite distinct from those of Russia. The revenue in 1888 was £1,706,564, including a surplus of £290,700 from the preceding year, whilst the expenditure was only £1,534,578. The public debt of Finland amounted on 1st January 1888 to only £2,796,405, nearly all of which sum has been expended on public works, education, &c., and is more than balanced by the state property. By the law of July 1886 the French decimal system, which had previously been adopted for the Finnish currency—the mark = 1 franc, and the penni = 1 centime—was extended to weights and measures as well, the French names being retained. The rate of exchange of the Finnish mark has hardly varied during the last 20 years, and notes or gold are at par.

Finland's army consists of 5400 men in time of peace, with about 20,000 reserves. These troops are divided into nine battalions of sharpshooters and one regiment of cavalry, this latter formed in 1889. Both officers and men must be Finnish subjects, and are only to be employed for the defence of Finland, except as regards the battalion of Finnish guards, which generally accompanies the emperor and grand-duke in his wars, as was the case in the last Russo-Turkish campaign. Finland has no navy of her own, but possesses a thriving commercial marine, which in 1887 numbered 2153 vessels of 268,200 tons register. Finnish ships, however, sail under the Russian flag. The value of the merchandise exported from Finland in 1887 was £3,082,640, the principal being: timber, £1,160,000; butter, £440,000; and paper, £260,000. The imports amounted to £4,234,600, of which cereals represented £520,000; iron and steel, £440,000; coffee, £320,000; textiles, £310,000; and sugar, £240,000. Nearly half of Finland's trade is with Russia; Germany being second, and Great Britain third on the list. There were in 1889 some 1750 factories and other industrial establishments in the grand-duchy, employing 22,000 hands. Of these the sawmills are the most important. Large quantities of iron are found in Finland, and copper, tin, silver, and gold exist; gold does not pay the cost of working. The grand-duchy formerly suffered severely from occasional famines—the last was in 1868—owing to short or wet summers; but these disasters have now been obviated by means of railways, canals, and improved agriculture. Physically the Finns proper are a strong, hardy race, with round faces, square shoulders, fair hair, and blue eyes, though intermarriage with Scandinavians and Russians has in many cases caused variations. They are of a somewhat phlegmatic temperament, but are honest, hospitable, clean, strictly moral, and very religious. The love of strong drink by which they were once distinguished is rapidly giving way before the spread of education and temperance doctrines. They possess many of the characteristics of the Mongolian races, to which they are ethnically related, and have a keen sense of independence and personal freedom, sorrow never having existed in the country except in the county of Viborg when it was in Russian hands.

*History.*—The Finns belong, as their tongue indicates, to the great Turanian or Ural-Altaic family, which still predominates in northern and central Asia. About the end of the 7th century or the commencement of the 8th the Finns, driven as it is supposed by the Bulgarians from their

settlements on the Volga, took possession of the country they now occupy; but they found inhabitants there already, whose memory popular tradition has handed down under the names of *Hudet*, *Jutilaset*, *Jatuliit*, and *Jotunit*. Probably the modern Lapps are the descendants of those primitive inhabitants. In the 12th century the Swedes turned their attention to Finland, more especially for the introduction of Christianity; but the struggle with paganism was long and obstinate, lasting for nearly 200 years. Three separate crusades (1157, 1249, 1293) finally brought about the subjection of the country to Sweden, and the adoption of the Christian religion. The first of these crusades was led by King Erik the Holy, accompanied by Henrik, Bishop of Upsala, an Englishman by birth. The latter was soon afterwards cruelly murdered by a fanatic Finnish peasant, and Henrik the Martyr has ever since been regarded as the patron saint of Finland. For over 600 years Finland was united with Sweden, and thus received the incalculable advantages of Christianity, civilisation, a constitution, and liberal laws. The Reformed religion was introduced into Finland by Gustavus Vasa in 1528, and King John III. raised the country to the dignity of a grand-duchy. Finland, however, became the theatre of frequent bloody struggles between Russia and Sweden, culminating in the cession of the whole country to Russia in 1809 by the peace of Fredrikshamn. Alexander I., however, in annexing Finland to Russia, promised the inhabitants that their constitution, religion, and laws should be faithfully preserved, as when under Swedish rule. This promise has been ratified by succeeding emperors, and thus we find the anomaly at the present day of a constitutional state in an autocratic country. Finland is certainly the best governed, and it might be added the most prosperous, part of the Czar's vast dominions.

For further information, see Koskinen, *Finnische Geschichte* (Leip. 1874); Ignatius, *Le Grand-duché de Finlande* (Helsingfors, 1878); Jonas, *Das Grossfürstenthum Finland* (Berlin, 1886); *Annuaire statistique pour la Finlande* (Helsingfors, 1888); also Senator Meckelin's *Précis du droit public de Finlande* (Helsingfors, 1886), of which an English translation by Charles J. Cooke was published in 1889 (Chapman & Hall, London).

*Language and Literature.*—The Finnish language is one of a group of five Ugro-Finnic tongues which constitute a branch of the great Ural-Altaic family of languages, comprising the Manchu, Mongol, Turkish, and Samoyede. The Ugro-Finnic group includes (1) the language of the Finns in Finland, and the Estonian (q.v.), (2) the tongue of the Lapps, (3) of the Finns of Perm, (4) of the Finns of Vologda, and finally (5) that of the Ugrian Finns, to which last belong the Vogul and Ostiak dialects in Siberia, and the Magyar in Hungary (see HUNGARY). The most highly cultivated language of the group is that spoken by the Finns proper, the Suomi of Finland. The Finnish dialects are all agglutinative forms of speech, with tendencies towards true inflection, so that occasionally the difference between agglutination and inflection is somewhat obscure. The nouns are not inflected, an additional word being used to denote the variations of case, number, and sex, whilst the prepositions and pronouns are suffixed to the words they modify. The verbs have only a present and past tense, another word being required to indicate the future. Rask considered the Finnish language to be one of the most sonorous and harmonious of tongues, and there is no doubt that as it is developed it will be more and more appreciated.

The literature of Finland was formerly almost entirely devoted to religious subjects. Part of the Old Testament had been translated in the 16th century, but it was not till 1642 that the whole of

the Bible was made accessible to those who did not know Swedish or Latin. The credit of rescuing the Finnish language from comparative oblivion belongs to Dr Zacharias Topelius and to Dr Elias Lönnrot of Helsingfors. The former published a collection of scattered songs in 1822, but in 1835 Dr Lönnrot gave to the world his famous epic *Kalevala*, being a systematic collection of popular songs taken down from the lips of the peasantry during years of patient research and wandering. By unwearied diligence he succeeded in collecting 12,000 lines of *runor* and *saga* that for generations had been handed down by the *rimolainen*, or singers, to the sound of the *kantela*, a sort of primitive harp. Not much notice was paid to this remarkable publication at first, but when in 1849 Dr Lönnrot, who had energetically continued his researches meantime, published a new and extended edition of 22,793 verses in fifty runes, its importance was soon recognised by philologists, and it was translated into Swedish, German, and French. The *Kalevala* is a singular monument of the earlier culture of the people, and has given rise to much critical literature, scholars not agreeing as to the character of the plot, some regarding the incidents as allegorical, others as referring to definite epochs. All, however, are of accord in considering the poem a pure epic with an oriental appreciation of nature, and rich in images, tropes, and synonyms. The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's *Hiawatha*, which is known to be an imitation of the Finnish epic. Professor Max Müller compares the *Kalevala* with the *Iliad* in length and completeness, and adds that 'it will claim its place as the fifth national epic of the world, side by side with the Ionian songs, with the *Mahābhārata*, the *Shahnameh*, and the *Nibelungen Lied*.' The *Kalevala* has been translated into English by J. Martin Crawford (New York, 1888, and London, 1889). There are translations by Kollan and by Castén (Swedish), by Bana and by Ujfalvy (Hungarian), by Schiefner (German), and by Le Duc (French). A Finnish-English grammar was published in 1889 at Oxford, by E. J. Eliot, secretary of embassy.

The first Finnish printed book was an *Abece-darium* in 1543; the Bible was not translated till 1642. During the 19th century, and especially within the last twenty years, there has been great literary activity in Finland, and the Russian government encourages in every way the development of the Finnish tongue *versus* the Swedish, which latter language, though still spoken by the higher classes, seems destined to practically disappear in the course of two or three generations. Most of Shakespeare's plays have been translated into Finnish, and the standard works of England, France, Germany, and Russia have long since been rendered into that language. At Helsingfors there is a Finnish theatre, in addition to a Swedish and a Russian theatre, with very good native actors. There are a great many Swedish and Finnish newspapers, and scientific or literary journals, and the publications of the various learned bodies are most valuable; amongst others, those of the Society of Finnish Literature (founded 1831), which has fostered the editing by Lönnrot, Borenius, Krohn, and other scholars, of precious collections of epical songs, ballads, 'songs-of-tears' or metrical laments for the dead, folk-tales, magical formulas, proverbs, riddles, and beast-fables. Porthan and Koskinen are the principal historians of the grand-duchy; Runeberg is undoubtedly the greatest poet and dramatist that Finland has produced, and Professors Krohn and Donner have made themselves most eminent for their works on Finnish. Professor

Donner has published in German a *Comparative Dictionary of the Finno-Ugric Languages* (Helsingfors and Leipzig, 3 vols. 1874-88); and there are several Swedish-Finnish dictionaries, besides Lönnrot's.

See the works of Castrén, Elmgren, and Weske; on the Kalevala, the works of Krohn, his letter quoted by Max Müller in the *Athenæum*, October 1888, p. 519, his posthumous *Kalevalan Toisinnot*, 'Variants of the Kalevala' (1888), and the 'Kalevala-studien,' trans. by Viktor Haekmann, in Veckenstedt's *Zeitsch. für Volkskunde* for 1889. Kaarle Krohn published at Helsingfors in 1886 a rich collection of beast-fables, &c. (*Suomalaisia Kansansatuja I. Eldinsatuja*).

**Finland**, GULF OF, the eastern arm of the Baltic Sea, between 22° and 30° E. long., and between 59° and 61° N. lat. It receives the waters of the great lakes Onega and Ladoga. The water of the gulf is not deep, and only very slightly salt. The topography of the Gulf of Finland, which has been thoroughly elucidated by Struve, forms an interesting part of the great work of the Russian survey of the Baltic. The navigation on the northern or Finnish coast is very dangerous, on account of the numerous islands and shoals.

**Finlay, GEORGE**, the historian of Greece, was born of Scottish parents at Faversham, in Kent, where his father, Major John Finlay, was inspector of the government powder-mills, 21st December 1799. After his studies at Glasgow and Göttingen, Philhellenism carried him to Greece, where he met Lord Byron, and devoted himself with patient enthusiasm to the study of Greek history and antiquities. With the exception of a short period of residence in Rome, and of study at Edinburgh University, the whole of his life was spent in the land of his adoption, which he continued to love, spite of the unworthiness of its leaders and of the miserable failure of his own generous schemes for promoting agricultural progress. For relief he turned to the task of writing its history. 'Had the hopes with which I joined the cause of Greece in 1823 been fulfilled,' he wrote in 1855, 'it is not probable that I should have abandoned the active duties of life, and the noble task of labouring to improve the land, for the sterile task of recording its misfortunes.' The first portion of his great work, *Greece under the Romans*, appeared in 1844, and was followed by the following instalments: *The History of Greece from its Conquest by the Crusaders to its Conquest by the Turks, and of the Empire of Trebizond, 1204-1461* (1851); *History of the Byzantine and Greek Empires from 716-1453* (1854); *History of Greece under Ottoman and Venetian Domination* (1856); and *History of the Greek Revolution* (1861). Finlay devoted the remaining years of his laborious life to revising and partly rewriting his history, but his death at Athens, 26th January 1875, prevented his completing the work, which was issued by the Clarendon Press, under the care of the Rev. H. F. Tozer, with the title, *History of Greece from B.C. 146 to A.D. 1864* (7 vols. 1877; vol. i. contains an autobiography). Freeman declares his history the greatest English historical work since Gibbon's *Decline and Fall*.

**Finnmark**, the most northern province of Norway, consists of a narrow strip of rocky coast-land, cleft by numerous bays and fjords. The area is 18,295 sq. m., of which three-fourths belong to the continent, the rest to the numerous islands which skirt its shores. The chief sources of wealth are fishing and reindeer breeding. Only very scanty crops of barley, potatoes, and a few other vegetables are raised. Pop. (1880) 27,000, principally Lapps. Hammerfest, the capital (70° 40' N. lat.), with (1885) 2289 inhabitants, is the most northern town of Europe. See Du Chaillu's *Land of the Midnight Sun* (1881).

**Fins** (allied to Lat. *pinna* or *penna*; see letter F), a term vaguely applied to outgrowths and limbs in aquatic animals. Thus, the paired fins of fishes are true limbs, the unpaired median fins are outgrowths. The term is similarly extended to cetaceans; while a still wider usage includes locomotor expansions in cuttle-fishes and some other mollusks. See **FISHIES**.

**Finsbury**, a parliamentary borough of Middlesex, forming the north part of London, consists since 1885 of three divisions, Holborn, Central, and East, each returning one member.

**Finsteraarhorn**, the highest peak (14,026 feet) of the Bernese Alps. See **ALPS**.

**Finsterwalde**, an old town of Prussia, 71 miles by rail S. by E. of Berlin. It has manufactures of cloth and machinery, iron-foundries, and coal-mines. Pop. 7566.

**Fiord**. See **FIRTH**, NORWAY.

**Florin Grass**. See **BENT GRASS**.

**Fir**, a name applied in a comprehensive sense to the true Pines, the Larch, and certain other conifers, but more properly used to denounce the Norway Spruce, the Silver Fir, and their congeners. These two species—now the types respectively of the genera *Picea* and *Abies*—were included in the Linnean genus *Pinus*; thus, the Norway Spruce was *P. Abies*, and the Silver Fir was *P. Picea*. By these specific names the trees were known to Pliny and other ancient writers, but by inadvertence on the part of Linneus they were misapplied so that each bore the other's name. This confusion was perpetuated when the species were removed from the genus *Pinus*, and set up as representatives of distinct genera. As kindred species were discovered and introduced, nomenclature became more confounded. Continental botanists endeavored for long with only partial success to restore the names *Picea* and *Abies* to their ancient use. The point, however, has at length been conceded in the *Genera Plantarum* (1862-76) by Bentham and Hooker; but amateurs and students of conifers will still be confronted with the confused nomenclature of the species in works on the subject published prior to the adoption of the recent change of the generic names. Their difficulty will, however, be lessened by their bearing in mind that species hitherto ranged under *Abies* must now be named *Picea*; thus, for instance, the Norway Spruce is no longer *Abies* but *Picea excelsa*, and the Silver Fir is *Abies pectinata*, not *Picea* of that designation.—It should also be noted that some trees commonly called fir are really pines; thus, the Scotch Fir (*Pinus sylvestris*) is a pine. See **PINE**.

The genus *Abies* comprises some twenty-five or thirty species, which are easily distinguished from the Spruce Firs by their erect, cylindrical or but slightly tapering cones, the scales of which are deciduous and fall away in maturity from the axis, which adheres to the branch; and by their flattened leaves being always more or less distinctly arranged in two ranks on each side of the branches, and generally in a horizontal direction. The genus *Picea* consists of about twelve species, the cones of which are pendulous, and the scales persistent, opening only when mature to shed the seeds. The leaves are arranged spirally, scattered around the branches, needle-like and quadrilateral or almost round. These are the broad essential distinctions of these two genera of firs, but they have some features in common. They are all evergreen-trees, mostly of spiral or pyramidal habit, their branches spring from the stem in whorls—a characteristic of certain other conifers—and the scales of the cones are thin or almost scarios at the apex, a point

which distinguishes them from the true pines. The species of both are widely distributed over the extra-tropical regions of the northern hemisphere, and the Norway Spruce even penetrates within the Arctic circle.

The last-named species, *Picea excelsa*, is one of the noblest and most useful of European firs, attaining the height of from 80 to 150 feet, but with no proportionate diameter of trunk, which is usually rather slender compared with its height. It is a native of the north of Germany, Russia, and Norway, where it forms immense tracts of natural forest. Since its introduction into Britain about 1540, it has been extensively planted, chiefly as a nurse for more tender and slower-growing trees, for which purpose its evergreen character and hardy constitution adapt it well. It does not succeed in windy, exposed situations, nor in thin, dry soil, but in moist, alluvial soil it attains its highest development. It is the *Fichte* of the Germans, called also *Rothtanne* or *Schwarzanne*. It yields

Fig. 1.

Norway Spruce Fir (*Picea excelsa*):

a, branchlet with male flower; b, branchlet with female flower; c, mature cone; d, one of the scales of cone, outside; e, one of the scales of cone, inside, showing seeds; f, a leaf with cross section; g, gall, caused by punctures of *Coccus abietis* and other insects.

the common Burgundy Pitch (q.v.). The bark of the spruce is a good and cheap non-conductor of heat; the cones are an excellent substitute for tanners' bark. In Sweden and Norway the inner bark is made into baskets; and the long and slender roots, split and boiled with alkali and sea-salt, are dried, and twisted into cordage, which is used both for shipping and by farmers. The wood is used for fuel and for house-building; it also supplies masts and spars for ships. It is the White Christiania deal and Danzig deal of the market, and is very largely imported into Britain from Norway and the Baltic. It is whiter, lighter, less resinous, and more elastic than the timber of Scotch Fir. The sapwood, whilst still in a gelatinous state, is sweet, and is eaten fresh in Sweden and Lapland; and the inner bark, in times of scarcity, is mixed with a little flour or meal of some kind and baked into bread. The young shoots, still covered with their bud-scales, are in many parts of Europe used for fumigation. The leaf-buds are also employed medicinally in cases of scurvy, rheumatism, and gout. The pollen is often sold by apothecaries instead of the dust of the Clubmoss or Lycopodium.

A very superior variety of this fir is known as the Red Norway Spruce. Dwarf varieties are cultivated amongst ornamental shrubs. The Black Spruce (*Picea nigra*), of which the Red Spruce (sometimes called *P. rubra*) is regarded as a mere variety caused by difference of soil, and the White Spruce (*P. alba*) form great woods in North America. The Black Spruce is found as far north as 65° lat. Both these species are now common in plantations in Britain. Both have quadrangular leaves; those of the Black Spruce are of a dark glaucous green, those of the White Spruce are of a lighter colour. The cones of the Black Spruce are short, ovate-oblong, obtuse, and pendulous, with rounded scales jagged at the edge; those of the White Spruce are oval, and tapering to a point, with entire scales. The Black Spruce is a valuable timber-tree, supplying yards of ships, &c.; but its planks are apt to split. The White Spruce is smaller, and the timber inferior. From the Black Spruce the *Essence of Spruce* is obtained, which is so useful as an antiseptic in long voyages, and is used for making spruce-beer. Spruce-beer is also made by adding molasses or maple-sugar to a decoction of the young branchlets, and allowing the whole to ferment. From the fibres of the root of the White Spruce, macerated in water, the Canadian Indians prepare the thread with which they sew their birch-bark canoes; and the seams are made watertight with its resin. From the twigs of the Oriental Fir (*P. Orientalis*), a native of the Levant, a very fine clear resin exudes, which is known by the name of *Sapindus' Tears*. This fir has very short quadrangular leaves, densely crowded and uniformly imbricated. *Menzies' Spruce* (*P. Menziesi*) and *Patton's Spruce* (*P. Pattoniana*) are now prized as ornamental trees in pleasure-grounds in Britain: both are natives of California, the former covering wide areas at from 7000 to 9000 feet elevation. It makes rapid growth in Britain, and apart from its ornamental value it has been suggested that it should be planted more extensively for its timber, which is described as very durable, though rather coarse grained. In southern California *Patton's Spruce* attains the height of from 200 to 300 feet, with a circumference of trunk of from 12 to 14 feet; but in northern California, where it is also found in great abundance at elevations of from 4000 to 6000 feet, it reaches the height of 150 feet as its maximum dimensions, towering above the rest of the forest at the lower levels, but dwindling as it ascends the mountains to the proportions of a shrub a few feet high. It is a slow-growing, but very handsome tree in Britain, with light-green, rigid, thickly set leaves having a glaucous tint below, which enhances its beauty. The Himalayan Spruce (*P. Morinda*) is a remarkably graceful tree found at elevations of from 6000 to 12,000 feet on the Himalayas. Where it succeeds well in Britain, it is one of the most beautiful of pleasure-ground trees, but should not be planted in cold districts. The leaves are longer than those of most other Spruce Firs, and densely clothe the branches, which assume a graceful pendulous outline. The Korean Spruce (*P. polita*) is a comparatively recent introduction to Britain. It forms vast forests on the mountains of Corea, and is indigenous also to Japan. In England it is a slow-growing tree, and should be planted only in sheltered situations.

The Hemlock Spruce of North America (*Abies canadensis*) forms great part of the forests of Canada and of the northern states, extending northwards as far as Hudson's Bay. Its timber is not much esteemed, as it splits very obliquely, and decays rapidly in the atmosphere; but the bark is valued for tanning. The leaves are two-rowed, flat, and obtuse. The cones are scarcely

longer than the leaves. The young trees have a very graceful appearance, but the older ones are generally much disfigured by remaining stumps of their lower branches.—The Douglas Fir (*A.*

Fig. 2.—Cone of Douglas Fir (*Abies Douglasii*).

*Douglasii*) is a noble tree, attaining a height of 250 feet, which forms immense forests in the north-west of America, from 43° lat. to 52° lat. The bark, when the tree is old, is rugged, and 6–9 inches thick. It abounds in a clear, yellow resin. The timber is heavy, firm, and valuable, the growth very rapid. Experimental plantations of this extremely rapid-growing tree laid down in 1860 by the Earl of Mansfield on his Scone estates, Perthshire, encourage the expectation that it will rival and perhaps surpass the larch in value as a timber tree.—The Mount Enos Fir (*A. cephalonica*), a native of Cephalonia, attaining a height of 60 feet and a diameter of 3 feet, yields durable and very valuable timber.—All these species have been introduced into Britain, and many of them are now common in our plantations, as well as others from the north-west of America and from the mountains of Asia, and are apparently quite suitable to the climate.

The Common Silver Fir (*Abies pectinata*, or *Pinus picea*) has erect cylindrical cones, 5–6 inches long, and two-rowed leaves, with two white

Fig. 3.

Common Silver Fir (*Abies pectinata*): a, branchlet with male flowers; b, branchlet with female flowers; c, a scale of cone, outside; d, a scale of cone, inside, showing seed; e, male flower undeveloped; f, male flower fully developed; g, leaf with cross section.

lines upon the under side. It forms considerable woods upon the mountains of Central Europe and of the north of Asia, and attains a height of 150–180 feet and an age of 300 years. It is not a native of Britain, but large trees are now to be seen in very many places. The wood is white, contains little resin, is very soft and light, and is employed for the ordinary purposes of coopers, turners, and joiners, and in ship and house carpentry, also for making handboxes and for many fine purposes, especially for the sounding-boards of musical instruments. The same resinous and oily products are obtained from the Silver Fir as from the Spruce and Scotch Fir, but of superior quality. It yields the beautiful clear turpentine known as Strasburg Turpentine. Very similar to the Silver Fir, but generally of much smaller size, and indeed seldom much above 30 feet in height, is the Balm of Gilead Fir (*Abies balsamea*), a native of North

America from Virginia to Canada. The wood is of little value, but the tree yields Canada Balsam (q.v.).

Besides these, a number of other species of *Abies* are found in the western parts of North America and in the Himalayas, some of which are trees of great magnitude, and yield excellent timber, as *A. grandis*, a Californian tree of 170–200 feet in height; *A. amabilis*, a species much resembling it; *A. nobilis*, a majestic tree, which forms vast forests on the mountains of northern California; *A. bracteata*, a Californian species remarkable for its slender stem, which rises to a height of 120 feet, and yet is only about 1 foot in diameter at the base, and likewise for the manner in which the middle lobe of each bractea of its cones is produced so as to resemble a leaf; *A. Webbiana*, the Himalayan Silver Fir, which in its native regions fills the upper parts of mountain-valleys, and crowns summits and ridges at an elevation of upwards of 10,000 feet, a tree of great size, 35 feet in girth, and with a trunk rising 40 feet before it sends out a branch. Most of these have been introduced into Britain with good prospect of their succeeding well in our climate, and other species, as *A. Picea*, a native of the Altai Mountains, very nearly resembling the Silver Fir, *A. Nordmanniana*, *A. Fraserii*, &c. *P. religiosa* is a tall and elegant tree, a native of the mountains of Mexico, with slender branches, which are very much used by the Mexicans for adorning churches; and its cones are shorter than those of any other Silver Fir.

**Firbolgs**, the name given in the fabulous history of Ireland to one of the races who successively invaded that country in what was probably the bronze age. The various tribes of the Firbolgs seem to have been Britons, and were said to have landed in Ireland under the command of five principal chiefs in three separate divisions, one in the river Slaney, the second in Mayo county, and the third in Ulster. Their chief stronghold, called Dind Ríg, was near the Barrow, in Carlow. The Firbolgs were in their turn defeated and almost exterminated by a new race of invaders, the Tuatha Dé Danann, in a battle fought at Moytura, in Mayo. Nevertheless, the race did not wholly perish, for there long continued to be Firbolg kings of Connaught, and in the time of St Patrick it was in all probability the Firbolgs who constituted the bulk of the population of Ireland.

**Firdausí**, or **FIRDUSÍ**, the *takhallus* or *nom de plume* (the term signifies both 'garden' and 'paradise') of Abū'l Kásim Mansúr, the greatest of Persian poets, was born about the year of the Flight 328 (930-940 A.D.), at Shadáb, a dependent township of Tús, in Khurásán, of a stock of *dihkans*, or petty landholders. He spent the greater part of his life on the paternal estate, wedded to his studies. From his grand epic, the *Shah Náma*, or Book of Kings, he has been styled by European *savants* 'the Homer of Persia.' Among the spoils gained by the Arabs at the downfall of ancient Iran was a complete history of Persia, compiled by order of Yazdajird, the last of the Sassanian dynasty, by the most learned historians, which was presented as a valuable gift to the Calif Omar—the reputed destroyer of the famous Alexandrian library. The calif caused this work to be rendered into Arabic, and luckily did not order its destruction, but left it to its chance among the general plunder, when it fell into the hands of a common soldier. The history of this Pahlavi work for some centuries is obscure, but at length it came into the possession of Mahmúd, sultan of Ghazni, whose court was crowded with the most eminent men of learning from all quarters. Mahmúd ordered Dakikí, the most illustrious poet at his court, to render the work into Persian verse, but he had not proceeded far with his task when he came to a tragic end. In his fifty-eighth year Firdausí resolved to visit the court of Mahmúd, but it was not easy to gain admission to the presence; yet, in spite of the resentment of the sultan's favourites at the intrusion of a stranger, he contrived, by means of a friend with whom he lodged, to convey to the sultan a specimen of his epic (he had been for years engaged upon the work which the death of Dakikí had left undone), and the result was an invitation to court. Mahmúd ordered his vazir to pay Firdausí a thousand gold dinars (about £300) for every thousand finished couplets; but the poet, having from early youth had the ambition to construct a canal-dam (*bund*) on his patrimonial estate for the benefit of his townsmen, preferred to receive the accumulated amount when he had completed his poem. The vazir of Mahmúd was secretly inimical to Firdausí, and accused him to the sultan of a decided leaning to the doctrines of Zoroaster; but his efforts as well as those of the other courtiers to undermine Mahmúd's confidence were of no avail, and Firdausí continued to enjoy the royal patronage.

Portions of the *Shah Náma* as they were written were often transcribed and circulated and admired far and wide. It is said that he was offered rich presents from the neighbouring princes, which he constantly declined. The later years of Firdausí's life in Ghazni—he seems to have dwelt some twelve years there altogether—were darkened by the death of his son in early manhood, whom he pathetically laments towards the end of his great epic.

At length, after thirty years' toil, the *Shah Náma* was finished in 398 A.H. (1008 A.D.), and the poet presented his monumental work to Sultan Mahmúd, who at once ordered his vazir to pay Firdausí 60,000 gold dinars—but no copy of the epic extant comprises more than 56,600 couplets, and some of these are evidently interpolations. The envious minister, however, despatched the same number of silver dirhams instead (the value of a dirham is about sixpence) in sealed bags. The poet was in the bath when the messenger arrived. 'On opening the bags, his lofty spirit felt all the indignity which he imagined the sultan intended to load him with. He immediately gave 20,000 to the keeper of the baths (*hamamdarí*), the same sum to the sherbet-seller, and the remainder to the slave who had brought the money.

"I wrote for fame," said he to the slave, "not for the attainment of riches." When the slave told the whole affair to Mahmúd, he was enraged at the insolence of his vazir, and said: 'This action will not only irritate the poet, but mankind will reprobate a sordid parsimony injurious to my fame. I ordered gold dinars to be sent, and you have substituted silver dirhams.' To this the wily vazir rejoined that whatever the sultan gives confers honour on the recipient, and it was insolent in Firdausí to treat any donation of his majesty with contempt. These and other insinuations ultimately aroused Mahmúd's indignation, and the poet, fearing the consequences, fled on foot from Ghazni, but not before he had composed and left behind him a most scathing satire on the sultan. Tidings of Firdausí's flight and the cause soon spread throughout Asia, and the sultan's conduct was severely condemned by the noble and the learned everywhere. For some time the poet was protected by the Nashi Al-Mutasim of Kohistán, but, he being a dependant of Mahmúd, Firdausí was again compelled to flee, first to Mazandarán and then to Baghdád. The sultan, however, hearing where the poet was residing, ordered him to be sent a prisoner to Ghazni; but the calif, unwilling to deliver Firdausí up to the tender mercies of Mahmúd, and being powerless to withstand the sultan, wrote to Mahmúd to the effect that Firdausí had been at his court and was now gone to El-Yaman; and it was with unspeakable grief that he saw the venerable poet once more become a fugitive. But instead of going to Arabia, Firdausí proceeded to Tús, his native place, where he hoped to pass the remaining years of his life in tranquillity.

The wrath of Mahmúd was at length softened into pity, and he ordered the 60,000 gold dinars to be carried to Firdausí at Tús. 'One day, while the poet was walking in the market-place, as a boy was reciting a verse from his satire on the sultan, he fainted, and was carried to his house, where he expired (411 A.H. : 1020 A.D.), without uttering a word. As his remains were being carried to the grave, the present from the sultan arrived at Tús. It was presented to the poet's daughter, who, contrary to the advice of her aunt, declined its acceptance, saying that, as her father did not receive the present in his lifetime, it would ill become her to accept what he declined.'

The *Shah Náma*, while probably based upon actual historical events, is for the most part composed of mythological and purely fanciful incidents, but these are adorned with all the glowing imagery of the Eastern imagination; while true descriptions of human nature and pathetic scenes are of frequent occurrence—such as, for instance, the fine episode of Rustam (the Hercules of Persia, and the chief hero of the epic) and Súhráb, which is unexcelled in its kind in the poetry of any country. We have an admirable example of fairy lore in Rustam's seven labours to slay the White Demon, in which the hero's horse Raksh ('lightning') plays no unimportant part. The following lines, which occur in the *Shah Náma*—

Choose knowledge,  
If thou desirest a blessing from the universal Provider;  
For the ignorant man cannot raise himself above the earth,  
And it is by knowledge that thou must render thy soul praise-worthy—

find their very echo in Shakespeare's saying, that

Ignorance is the curse of God;  
Knowledge, the wing wherewith we fly to heaven.

Besides his immortal epic Firdausí wrote a number of shorter pieces, *kasidas*, *ghazals*, &c., which are preserved in several Persian anthologies. He was the first, apparently, to compose a poem on the wife of Potiphar and Joseph, under the title

of *Yásuf & Zulaikhá*, a subject which has been a great favourite with many later poets, Turkish as well as Persian.

See Atkinson's epitome of the *Shah Náma*, with numerous passages done into English verse; Sir Gore Ouseley's *Biographical Notices of Persian Poets*; Miss Zimmern's *Epic of Kings*; Robinson's *Persian Poetry for English Readers* (1883); the works of Von Hammer, Wahl, Gerres; and Dr Ethé, *Sitzungsberichte der bayrischen Akademie* (1872).—There are many beautifully illuminated manuscripts of the *Shah Náma* preserved in the great European libraries, and the complete text was edited by Turner Macan (4 vols. Calcutta, 1829). In 1811 Lumsden, of the college of Fort William, Calcutta, published a portion of the text. There is a complete French translation by Professor Julius Mohl, with the Persian text on the opposite page (7 vols. fol. Paris, 1838-78; in 7 vols. 12mo, 1876-78). Another edition, based upon seven MSS., entitled *Firdusii Liber Regum qui inscribitur Shahname*, by Joannes Augustus Vullers, was continued after his death by S. Landauer (vols. i.-iii. Paris, 1877-81).

**Fire.** Countless stories of fireless men have been retailed by credulous travellers, and there is hardly a primitive mythology which has not woven a web of fable round its origin; not seldom it is ascribed to a special theft from the gods by some greatly daring hero, like the Greek Prometheus or the New Zealand Maui. As far as actual knowledge goes we find that the possession of fire and the art of making it by one method or other have belonged to the vast majority of mankind as far back as we can trace. The original method of finding fire was undoubtedly by the simple friction of two pieces of wood, which was developed by progressive art into more complex and convenient methods. One of the simplest methods in use is what Mr Tylor terms the 'stick-and-groove,' in which a blunt-pointed stick is run along a groove of its own making in a piece of wood lying on the ground. By this means a Tahitian can produce fire in a few seconds. Somewhat similar is the Malay process of striking fire by rubbing together two pieces of split bamboo, which has been conveniently fitted by nature with a siliceous coating. Again, the most widespread method is that to which Tylor applies the term 'fire-drill'—a primitive kind of boring instrument, thus described by Captain Cook from his observations of the native Australians: 'They take two pieces of dry soft wood; one is a stick about eight or nine inches long, the other piece is flat: the stick they shape into an obtuse point at one end, and pressing it upon the other, turn it nimbly by holding it between both their hands, as we do a chocolate-mill, often shifting their hands up, and then moving them down upon it, to increase the pressure as much as possible.' Many improvements upon this simple method are found, as that on the principle of the carpenter's brace used by the Gauchos of the South American pampas; the Eskimo method of winding a cord round the drill, so as by pulling the two ends alternately to make it revolve very rapidly; the Sioux bow-drill, in which a bow with a loose cord is substituted for a simple cord; and the pump-drill, familiar in English tool-shops, and used by the Iroquois to generate fire. The Fregians strike sparks with a flint from a piece of iron pyrites (Gr. *pyr*, 'fire') upon their tinder—a use which the etymology of the word shows to have been known to the ancients. The flint and steel must have come into use soon after the beginning of the iron age, but its origin in the civilised world is wrapped in the mists of antiquity. Among savage peoples it has made its way along with iron, but has often failed to supersede the fire-sticks. The use of the burning-lens to generate fire was known to the Greeks, and we are told by Plutarch was the method of solemnly reviving the sacred fire at Rome. The

last phase of fire-making—by lucifer matches—is fast making even the fire-sticks of the South African savage mere curious relics of the past. A strange survival of the ancient methods is the fire-charming still used in India for kindling the sacrificial fire, and the kindling by *wild-fire* alone of the English *need-fire* and German *Nothfeuer*, through which cattle were driven to avert pestilence down to the 19th century, in spite of the constant opposition of the clergy. The Easter and Midsummer bonfires, so closely connected with ancient sun-worship, were tolerated and even adopted by the church, but the *need-fire* was disallowed by Rome; while in Russia, on the contrary, it seems to have been practised under the direct sanction of the parish priests.

The religious history of fire is even more obscure than the history of its production, although everywhere we find that a rich mythology has gathered round the subject. Like all the chief manifestations of natural forces, fire was early personified and worshipped, and we see a similar process of personification and divinisation in the names of the first fire-givers—the Greek Prometheus, the *pra-mantha* of the early Aryans, and in his Chinese parallel Say-jin. The god of fire possesses generally enigmatic and variable qualities, as in Loki; now severe and cruel like Molech and Ximlenteuctli; now beneficent like Hestia, Agni, Atar, Ptah, and Baal Hamman. We find among the Greeks, the Phœnicians, the Egyptians, Slavs, and Mexicans the co-existence of several fire-gods who personify respectively the diverse functions of fire; in the Vedas, on the contrary, we have the notion of the identity of Agni alike in the fire, the sun, and the lightning. Agni, the essential identity between life, and fire visible in the sky but latent in everything, is an elemental idea among Romans, Hindus, Persians, Slavs, and Red Indians alike. The phenomena of generation are assimilated to the production of fire, whence fire becomes regarded as the author of life, and its worship is appropriately associated with phallic rites. The human soul is of the nature of fire; and fire, the common element of gods and of their creatures, of beings and things, becomes the soul of the universe, and plays a cosmic rôle as universal creator—a conception as akin to the philosophic mind of Zeno as to the primitive worshippers of Ptah and Agni.

Fire has ever been regarded as the great purifying element *par excellence*, not so much from its devouring properties and its incorruptibility as from its power as the dispeller of the demons of darkness. Hence the universality of belief in its power over evil spirits, and the use of lighting fires upon tombs, as well as of ordeals by fire—a pure agent which cannot harm the innocent. Fire puts to flight specially the spirits which cause maladies, whence the philosophy of magical exorcism, and of the *need-fire* spoken of above. Fire again is considered as the heavenly mediator, which descends in thunder and remounts in flames, devouring the offering and thus answering the prayers of the priest. From this follows naturally *pyromancy*, the interpretation of oracles by fire, and hence the religious character of the cremation of the dead, seen in the outward act of the apotheosis of a Roman emperor. Lastly, fire is considered as the protector of collective existence, whence the perpetual fires kept burning among various peoples, as by the Roman Vestals, the ancient Peruvians, Mexicans, the Damaras, and the like. Fire was carried by ancient Greek colonists from the sacred hearth of the mother-city, and is still the symbol of union among the red-skins of North America. See chap. ix. of E. B. Tylor's *Researches into the Early History of*

*Mankind* (1865), and Kuhn, *Die Herabkunft des Feuers und des Göttertranks* (2d ed. 1886); Goblet d'Alviella, *Histoire Religieuse du Feu* (1887); also the articles BELTEN, NEED-FIRE, ORDEAL, PARSIS, ZOROASTER.

The physics and chemistry of fire in various aspects will be found treated at COMBUSTION, FLAME, HEAT, LIGHT; see also ELECTRICITY, FRICTION, FUEL. Forest fires and prairie fires occur in some regions very frequently, and are often rapid in their progress and most destructive. The rest of this article is devoted mainly to an account of the means of preventing or extinguishing conflagrations and minimising the damage done by them.

**Fire-engine**, a machine employed to throw a jet of water for the purpose of extinguishing fires. Machines for the extinguishing of fires have been used from a very early date. They were employed by the Romans, and are referred to by Pliny; but he gives no account of their construction. Apollodorus, architect to the Emperor Trajan, speaks of leathern bags, with pipes attached, from which water was projected by squeezing the bags. Hero of Alexandria, in his *Treatise on Pneumatics*—written probably about 150 B.C.—describes a machine which he calls 'the siphon used in conflagrations.' It consisted of two cylinders and pistons connected by a reciprocating beam, which raises and lowers the pistons alternately, and thus, with the aid of valves opening only towards the jet, projects the water from it, but not in a continuous stream, as the pressure ceases at each alternation of stroke. By some it has been contended that he was not ignorant of the value of the air-chamber.

Little or nothing is known as to the extent to which engines of this kind were practically used. We have accounts of 'instruments for fires,' and 'water syringes useful for fires,' in the building accounts of the city of Augsburg, 1518; and, in 1657, Caspar Schott describes a fire-engine used in Nuremberg, which must have been almost identical in construction with that described by Hero. It had a water-cistern, was drawn by two horses, was worked by twenty-eight men, and threw a jet of water, an inch in diameter, to a height of 80 feet. It was not until late in the 17th century that the air-chamber and hose were added; the first being mentioned by Perrault in 1684, and the hose and suction-pipe being invented by Van der Heide in 1670. In England hand-squirts were used up to the close of the 17th century. They were of brass, and contained three or four quarts of water. A man held the handles at the sides, and pressed the button at the end of the piston against his chest; or two men held the handles at the sides, while a third forced up the piston. The nozzle was dipped in a vessel of water after each discharge, then raised, and the water again forced out. So clumsy an apparatus could have been but of little service in the fearful conflagrations to which our old wood-built towns were subject. By 1730 Newsham in London had made successful fire-engines; the first used in the United States were of his make.

With the addition of the air-chamber and hose, and some improvement in the details of construction, the 'siphons' of Hero became the modern fire-engine. The principle of the action of the air-chamber, and of its connection with the pumps, &c., will be easily understood by the aid of fig. 1, where *a* represents in section a piston ascending, *d* the other piston descending, *f* the pipe or hose communicating with the water-supply, *g* the hose that conveys the issuing stream to the fire, *bc* the level of the water in the air-chamber, *e* the space above filled with compressed

air. The rising piston raises the water from *f* to fill its cylinder; the descending piston forces the water contained in its cylinder into the bottom of the air-chamber, and thereby compresses the air in *e*. The pistons rise and descend alternately. The compressed air reacts by its elasticity, and pressing upon the surface, *bc*, forces the water through the hose.

*g*. The hose, *g*, may have either a direct opening into the bottom of the air-chamber or through the top, as shown in the diagram; in the latter case the connecting pipe must go nearly to the bottom to prevent the chance escape of the air. In the space *e*, above *bc*, the whole of the air that formerly filled the chamber

is supposed to be compressed. Assuming this to be one-third of its original bulk, its pressure will be about 45 lb. to the square inch, and this pressure will be continuous and nearly steady, if the pumps act with sufficient force and rapidity to keep the water at that level. As air may be compressed to any extent—and its elasticity is increased in exactly the same proportion—the force that may be stored in the compressed air is only limited by the force put upon the pumps, and the strength of the apparatus.

There are many kinds of fire-engines, great and small. The simplest consists of a force-pump and a receptacle for water. In the larger engines the cistern is dispensed with, a flexible suction-pipe stiffened with spiral wire being carried directly to the water-supply. The engines used by fire-brigades are usually drawn by two or four horses, though smaller engines are made to be drawn by hand or by one horse. The hose of leather, fastened by metal rivets, has been superseded by rubber-lined canvas, which is strong, light, and flexible.

The 6-inch manual fire-engine of the Metropolitan Fire-brigade consists of a pair of single-acting force-pumps, mounted on a carriage with

Fig. 1.

Fig. 2.—Messrs Shand, Mason, & Co.'s Railway Platform Fire-engine.

four wheels; at each stroke they discharge 1.83 gallon, whether working at a pressure of 100 lb. to the square inch or of only 2 or 3 lb. They are most effectively worked by about thirty men. Their weight, with implements, firemen, and driver, is about 30 cwt. These are found more convenient

for general purposes than larger engines, as they can be drawn at a gallop by two horses for any distance up to fifteen miles. Four horses are occasionally used for greater distances. The pumps are worked by levers attached to a spindle passing lengthwise through bearings in the carriage frame, and on the spindle is a cross-bar to communicate motion to the pistons of the pumps. The levers are connected lengthwise by long horizontal bars to enable a number of men to work together upon the same pumps. Their principle of action will be understood from fig. 2, which represents a special fire-engine constructed for use in railway stations. It has been selected for illustration as it shows at a glance the arrangement of the

Fig. 3.

I, steam cylinder, the piston of which is connected to the ram or plunger, N, by two rods, one of which is shown at H; the connecting rod, T, transmits motion to the crank, G, producing a rotary motion of the crank shaft, M, on which is fixed the eccentric, E, for working the slide valve, U, and the feed-pump, V; this shaft also carries the fly-wheel, Z. Attached to the ram, N, is bucket, O, in which the india-rubber delivery valves with their guards are shown; P, foot or suction valve; C, inlet to suction chamber; B, pump barrel or water cylinder; K, pump head; L, concentric frame which indelibly connects the steam and water cylinders; R, two discharge outlets, each of which is commanded by the stop-valve, S, with its lever, A. The starting valve of engine is shown at X, and the copper delivery air-vessel at Q.

is filled with cold water, steam at 100 lb. pressure cannot be obtained in less than 14 minutes. To avoid this delay the water in the boiler may be kept always hot; but if this is done by a constant fire in the fire-box, smoke and soot accumulate to a serious extent. The plan adopted by Captain Shaw, of the Metropolitan Fire-brigade, is to have a removable gas-burner kept burning in the fire-box of the

fire-engine. The best fuel is dry shavings, dry firewood, and steam coal. Oil and spirit should not be used, as they leave a deposit of soot on plates and tubes. If the fire is kindled when the alarm is received, the steam may be well up ere the engine reaches the scene of the fire. As a rule, the simplest fire-engine is the best. In the United States steam fire-engines have almost wholly superseded manual engines; and the engines are usually larger and heavier than those used in England. The heaviest American engine, with water in the boiler and men on the engine, weighs over 5 tons, the lightest 2½ tons; those of about 3 tons have of late been preferred. A section of a single cylinder steam fire-engine is shown in fig. 3; the three-cylinder engine is similar in principle, but has no fly-wheel.

Various chemical liquids have been proposed, and to some extent used, as flame-extinguishers. In Germany a cardboard case is used, containing saltpetre, sulphur, &c., which when kindled produce a vapour capable of choking a fire in a closed space. Chemical fire-extinguishers are of various sizes and kinds, but mainly depend on the rapid production of carbonic acid gas, which is an enemy to all kinds of combustion. Water is capable of absorbing large quantities of carbonic acid, which is easily formed by the mixture of acid and alkali. When the gas is generated, its expansion acts as a propelling power, and the fluid being forced into the flames, the gas in solution is liberated by the evaporation of the water containing it. Glass bottles containing the materials may be hung up in convenient places in factories or dwelling-houses, and these are so arranged that when the bottle is thrown down gas is generated, and tends directly to smother the flame. A portable fire-extinguisher, called the extinetur, is a cylindrical tank made so that it can be carried on the back, containing some 7 or 8 gallons of water. An internal handle is acted on by a lever from the outside, and breaks a bottle of acid when it is required for use. The combining of the elements give off carbonic acid gas sufficient to produce a pressure of from 70 to 100 lb. per square inch on the water, which may be discharged to a distance of 50 feet. Chemical engines on carriages are also in use in the United States and Germany, which carry each two tanks of water (80 gallons), carbonate of soda dissolved in the water, and sulphuric acid in a separate tank, which is mixed with the soda and water, so as to produce carbonic acid in sufficient quantity to give a pressure of 140 lb. In Berlin the steam-engines have tanks filled with liquid carbonic acid, which is liberated so as to expel the water until the steam has been got up. Another chemical contrivance discharges hydrochloric acid and ammoniacal gases. In the early stages of a fire even pails and buckets may be most serviceable; and where the water-supply is very good the hose may be attached directly to the fire-plug or hydrant without any engine.

**Fire-brigades.**—For working fire-engines a body of firemen are required. The fire-insurance companies formerly had separate establishments of fire-engines and firemen; but in 1825 some of them united, and by 1833 all the important companies combined, and the London Fire-brigade was formed under the management of Mr Braidwood, whose death in the discharge of his duties at the great fire in 1861 was justly deplored as a national loss. In 1865 an act of parliament empowered the Metropolitan Board of Works to take over the engines and appliances of the London Fire-brigade establishment; to secure the services of the brigade men; to construct additional engines and stations; to map out the metropolis into convenient districts; and to cause the firemen to act in harmony with a

salvage corps. The men of the brigade wear a uniform, with strong helmets and metal epanlets to protect them from the blows of falling beams, &c. The courage and skill of the men in making their way through and about burning buildings, for the purpose of directing the stream from the hose, or for saving life and property, and the general efficiency of the whole organisation are worthy of the highest praise. The insufficiency of the London water-supply sometimes frustrates the exertions of the firemen. Most provincial towns now have a fire-brigade upon the London model. The fire-brigade is supplemented to some extent by the police, the water companies, and the insurance companies' salvage corps, as well as by helpful members of the public. For the protection of London, with its area of 121 square miles, its 500,000 houses, and 4,000,000 inhabitants, there was, in 1889, a force of 591 firemen of all ranks, 83 coachmen and pilots, 131 horses, 150 fire-engines (of which 55 are worked by steam), 155 fire-escapes and other long ladders, and 33 miles of hose. The number of calls received during the year 1888 was 4228, of which some proved to be false alarms, some were only alarms for chimneys, and the remainder, 1889, for actual fires. The number of persons endangered by fire was 178, of whom 130 were saved and 48 lost their lives. Of the 48 lost, 28 were taken out alive, but died afterwards. The quantity of water used was 9,000,000 gallons. The cost of the brigade for the same year was £122,000. In 1889 the London County Council resolved at once to augment the fire-brigade by adding 138 firemen, 4 new stations, with steamers and manuals, and 50 fire-escapes; and to increase the electrical alarms to over 600.

The city of Manchester has an area of 3927 acres, with a population of about 400,000. The Manchester Fire-brigade protects besides the districts beyond the city, with an area of 17,000 acres and a population of 193,000. The brigade consists of 51 men permanently employed; and in 1888 it attended 389 fires in the city and 37 beyond it. The Liverpool Fire-brigade protects 5300 acres and 604,465 persons, and comprises 7 officers and 9 firemen wholly employed in fire-brigade duties, besides 204 police-constables drilled as firemen. There are four steam fire-engines and two manual ones. The average number of fires in Liverpool in 1878-88 was 198 per annum. In Glasgow the protected area is 5920 acres, with a population of 551,435; there are 84 permanent firemen, and 51 auxiliaries from the police, 7 steam fire-engines, and 9 manual ones. In 1888 the brigade attended 422 fires.

In America all the fire departments were formerly voluntary; but this plan was gradually abolished in most large cities, and replaced by carefully organised paid departments. Americans are justly proud of their well-equipped firemen, to whom is assigned on public occasions a prominence unknown in Britain. The paid fire-extinguishing corps of the United States are generally organised into companies of from six to twelve officers and men

each, equipped with either a steam fire-engine and hose tender or a chemical fire-engine (called engine companies); or with a hose-carriage only (called hose companies); or with a hook-and-ladder truck (called hook-and-ladder companies). Permanency of position, dependent on good conduct, was first assured to the members of the fire-extinguishing corps in 1867. The fire-extinguishing corps in the United States are usually superior in size, number, and capacity of engines to those of most other countries; though the rapid growth of American cities is apt to produce a lack of organisation and carelessness. The New York fire department has long been regarded as a singularly perfect institution, and has practically a military organisation, under three commissioners appointed by the mayor. The men are constantly on duty, save when on parade or at their meals, and do duty in barracks beside their engine and ladder. The horses stand facing the engine, are loosened by an automatic electric arrangement when the warning is given, the harness ready suspended above them drops on their backs, and in a few seconds they may be harnessed to the engine, which is supplied with water at boiling heat from stationary boilers. The corps of many other cities of the Union are also famous for organisation, discipline, and efficiency.

The hook-and-ladder, or scaling-ladder, which is an important item in the fireman's apparatus in New York and many other cities of the United States, is a pole about 12 feet long, with projections on both sides to serve as steps, and at the end a long hook nearly at right angles to the pole. Fixing one of these in the lowest window of a building, a fireman ascending to the top of it can fix a second ladder in the window of the next story; and so by using alternately the one and then the other scaling-ladder can reach the top of the highest building. Scaling-ladders have been used in connection with fire extinguishing in France for upwards of a century. In the United States these scaling-ladders were first adopted in St Louis; but the example was not lost on New York, which in 1885 had 14 per cent. of its buildings so high that the windows of the top floors could not be reached by the longest 'extension ladders' in use. The 'jumping sheet,' designed to catch persons falling or jumping from a height at fires, is usually made of canvas, with rope handles along the edges for holding it stretched out. The 'water tower' has also come to be in many American towns regarded as a valuable adjunct to the flexible hose, or substitute for it. It is a long length of iron tubing planted vertically on a carriage, and capable of being extended to the height of the topmost window of any house. The tower is connected beneath with the water-supply; and a nozzle at the top, at right angles to the tube, discharges solid water from close quarters with more effect than spray from a distant hose.

The following table, prepared by Captain Shaw for his *Fires and Fire-brigades* (1884), shows comparative data as to ten of the most important cities of the world in 1882:

| City.            | Area in sq. miles. | Estimated Population. | Cost of Maintenance of Fire-brigade for 1882. | Total Number of Firemen. | Number of Fires, exclusive of False and Chimney Alarms. |
|------------------|--------------------|-----------------------|-----------------------------------------------|--------------------------|---------------------------------------------------------|
| Berlin .....     | 20                 | 1,128,000             | £209,200                                      | 765                      | 543                                                     |
| Boston .....     | 37                 | 400,000               | 86,191                                        | 668                      | 349                                                     |
| Brooklyn .....   | 22                 | 650,000               | 72,701                                        | 256                      | 161                                                     |
| Chicago .....    | 36                 | 508,300               | 109,004                                       | 397                      | 919                                                     |
| Cincinnati ..... | 25                 | 269,000               | 41,330                                        | 172                      | 280                                                     |
| London .....     | 121                | 3,816,843             | 108,453                                       | 576                      | 1926                                                    |
| Montreal .....   | 6                  | 140,747               | 11,319                                        | 68                       | 226                                                     |
| New York .....   | 42                 | 1,206,299             | 335,816                                       | 826                      | 1273                                                    |
| Paris .....      | 30                 | 2,269,023             | 80,624                                        | 1742                     | 982                                                     |
| Vienna .....     | ..                 | 1,108,860             | 20,000                                        | 180                      | 353                                                     |

It will be noted that London, with a population of near four millions, and property calculated at fourteen hundred millions of pounds, had but 576 firemen, and spent on its brigade only £103,000; while New York, with one-third of the population, spent £335,000.

**Fire-alarms, &c.**—Throughout many cities and towns are established electric fire-alarms—boxes placed in conspicuous places, at corners of streets, &c., which are connected with the fire-engine stations, and may be made to act by pressing a button or pulling a handle, after the glass covering the apparatus has been broken. There are also alarm boxes which are arranged to act of themselves when the heat of a fire touches them, by means of the expansion of a spiral strip of metal under the influence of the increasing temperature of the room or place where it is fixed.

When a fire is discovered by a policeman or a passer-by, the alarm will in some way be communicated to the fire-engine station as swiftly as possible. The bell is rung, and the men on duty, as soon as they feel sure it is a real appeal for help, immediately harness the horses to the engine and start. The start should, according to circumstances, be made in from one to four minutes after the alarm is received; the pace of the horses should be a mile in four minutes with good horses. On a warning to a fire-escape station at night, the firemen in charge should in less than one minute be moving towards the fire with the escape, at a rate of six miles an hour.

Among appliances that are or may be carried by firemen are axes, mattocks, ladders, canvas buckets, lamps, saws, &c. And the firemen may to a certain extent be helped to breathe in a room full of dense smoke by various devices, such as a breathing-tube, a portable bag of air, a smoke-cap (a kind of respirator or air-filter), a smoke-jacket of cowhide with an air-tube from the engine, or even a complete diver's dress of the Fleuss type (see *DIVING*).

**Fireproof Buildings.**—The problem of constructing warehouses, dwelling-houses, &c. that shall be proof against all risk of conflagration has not yet been solved. The liability to conflagration may be greatly diminished by the construction of a building, but cannot be entirely averted; and therefore, in all 'fireproof' buildings containing furniture or other combustible materials of any kind, the ordinary precautions against fire should be strictly observed. Unless this be understood, a so-called fireproof building may be more dangerous than an ordinary one, especially in warehouses, &c. intrusted to the care of watchmen and others, who, relying upon the supposed immunity the name expresses, are liable to neglect many precautions they would not fail to observe in a building believed to be dangerous.

The nearest approximation to fireproof construction may be obtained as follows: The walls should be of stone or brick, and any ties, lintels, &c. required in the construction should be of iron. Wherever wood is inevitably used, it should be prepared with silicate or tungstate of soda, or dissolved alum. Brick arches of small span thrown between iron girders form one of the earliest kinds of fireproof flooring. But experience has shown that, in different ways, both wrought-iron and cast-iron beams are frequently destroyed in the case of a building taking fire. By Whitchord's method the metal girders are incased in fireclay blocks. Measure's patent fireproof flooring consists of iron girders, 3 to 4 feet apart, resting on the lower flanges of which are placed 1 iron fillets at intervals of 9 inches. Concrete is then filled in between the girders, and supported by centering until it sets. In Dennett's system

concrete arches are thrown between iron girders. Northcroft's flooring is constructed by forming flat arches of specially moulded firebricks. Each arch is double or in two rings, slightly apart, and with the space between them filled up with cement. The arches rest on fireclay skewbacks, which inclose the supporting iron beams. The roof should be constructed in like manner, wooden rafters being entirely excluded. The doors should be of iron, and the security would be much increased if the doors between any two apartments containing combustible materials were double, with a space between them equal to the thickness of the walls. Of course, it is not practicable to carry out all these precautions in a dwelling-house, but the danger from fire may be considerably diminished by attending to some of them. The most important conditions for a warehouse are that each apartment shall be separated from the next by stont walls of non-conducting materials, and more especially that each shall be as nearly as possible airtight; and whenever, from the nature of the goods, ventilation is required, it should be obtained by periodically opening the doors and windows. If the apartments are airtight, any fire will extinguish itself, unless there be along with the combustible goods some oxygen-giving substance, such as saltpetre, chlorate of potash, or other nitrates or chlorates.

At first sight it may appear that a warehouse built entirely of iron would be effectually fireproof, but this is far from being the case. In the first place, iron conducts heat more readily than any other material used in building; secondly, cast-iron is liable to crack and split when suddenly heated or cooled. Iron supports may, under some circumstances, be even more objectionable than wood, for if the water from a fire-engine were to play upon a heated cast-iron girder it would probably give way immediately, while a stont wooden beam might have the fire in it extinguished before it was burned through. In great fires the heat is sufficient to fuse iron.

In most civilised countries there are laws regulating the building of houses, so as to render fires less likely and destructive. The theory of all such laws is that the materials and modes of construction should themselves prevent the spread of fire without the presence of firemen; but these laws are very seldom rigorously enforced, and are often defied with impunity.

But even the most perfect fireproof buildings may become dangerous by reason of their contents. Thus, all explosives and combustibles require special care and superintendence. Many manufactures are essentially dangerous, as when oil is largely used. And it is known that spontaneous combustion may positively take place when considerable masses of lampblack, tow, linen, paper, cotton, calico, woollen stuffs, hemp, wood ashes, or ochre are slightly soaked in oil, and packed so that the air has access to them, especially if reached by the moderate warmth of the sun.

Many terribly sudden and fatal conflagrations in theatres have proved that they are, and inevitably it may be, specially exposed to risk from fire. Among valuable precautions are a strong iron screen to let down, so as wholly to separate the stage (where the fire usually begins) from the auditorium; wide passages leading directly to the exit doors; numerous doors easily opened and made to open outwards; illumination not by gas but by electric light; as well as the ordinary rules of safety applicable to all buildings. Fires on shipboard, unless discovered and checked at an early stage, are wont to be specially disastrous.

**Sprinklers.**—Amongst precautions against fire, attention has been much directed to sprinklers con-

needed with the water-supply distributed throughout a building. Some of these are turned on by hand, others are automatic. It is claimed for one of these automatic sprinklers that it will discharge water whenever the temperature around it reaches 160° F. When the temperature rises to 160°, the solder joint melts rapidly, the valve seat is withdrawn, and the valve, falling down, makes a deflector for the distribution of water in a spray. Early forms of sprinkler were rose-heads, or hollow perforated bodies; but it was found that the perforations were stopped by dust, or, when in action, by sediment in the pipes. Some sprinklers are arranged to act by means of a thread which burns when the heat becomes sufficient, and so releases the discharge. Lines of horizontal distributing water-pipes (connected with the public water-supply, with a tank on the roof of the building or on a tower) are carried through the building, near the ceilings, from 8 to 10 feet apart, and the sprinklers are attached to these pipes, one to every 10 feet.

**Fireproofing.**—There are many means by which fabrics may be prevented from flaming, their combustion being reduced to a slow smouldering. By moistening the fabric with a solution of any saline substance, which, upon drying, will leave minute crystals deposited in or between the fibres, its inflammability will be greatly diminished; but the salt imparts a degree of harshness to the fabric. Alum, sulphate of zinc, and sulphate of soda are effectual to prevent flaming, but weaken the fibre. Common salt does the same. Phosphate and sulphate of ammonia are less objectionable on this account, but the former decomposes by contact with the hot iron in ironing. Tungstate of soda is said to have no injurious effect on the fibre. Sulphate of ammonia, chloride of ammonium (sal ammoniac), and borax are among the best fitted for domestic use, though they are not unobjectionable. For made-up clothing, borax is, perhaps, the best, as it is most effectual in its action, and is the least injurious to the appearance of the article, though it is stated to have some weakening effect on the fibre. Wood has been treated in a similar manner. Milk of lime, alum, sal ammoniac, sulphate of ammonia, chloride and sulphate of zinc, sulphuret of lime and baryta, &c. have been used, and its inflammability, but not its combustibility, is removed. The most efficient protection to wood is silicate of soda. If planks of moderate thickness be brushed three or four times over on each side with a strong solution, they are rendered absolutely unflammable and almost incombustible; they will only burn when very intensely heated. The silicate fuses and forms a glass which envelops the surface, and even the internal fibres of the wood if it be sufficiently saturated, and thus seals it from the oxygen of the air. But it seems necessary that the saturation should be periodically repeated if the process is to retain its effect. Asbestos paint is serviceable to some extent, but is apt to peel off (see ASBESTOS).

**Fire-escapes.**—An immense number of contrivances have been at different times proposed for enabling people to escape by windows and house-tops from burning buildings. They are of two distinct kinds—one for affording aid from outside, and the other for enabling those within the house to effect their own escape. Of the latter the simplest is a cord that should be firmly attached to the window-sill of every sleeping-apartment, and coiled up either in a box on the floor or under a dressing-table or other suitable place. A rope one-quarter or three-eighths of an inch thick, and knotted at intervals of about a foot, is well adapted for the purpose. A man with tolerable

nerve may let himself down by means of such a cord, either by placing his feet against the wall and working down by holding to the knots, or by clinging with his feet and knees to the rope as well as with his hands. A man may let down a woman or child by means of a sack at the end of the rope, or simply by fastening them to the end, and letting the rope pass through his hands, aided if necessary by the friction of the rope on the window-sill. In American cities large tenement-houses are commonly provided with a permanent fire-escape in the shape of iron ladders running up the back of the building, with light iron balconies at each story.

Fire-escapes to be used from without consist either of simple ladders kept in police-offices or other convenient stations, or a series of ladders that can be jointed together; of poles with baskets attached; of ropes with weights at one end, that they may be thrown or shot into windows; of combinations of ladders, ropes, bags, baskets, nets, &c.

But what is usually known as a fire-escape is a ladder mounted on a carriage with four wheels. Fire-escapes are of various patterns, but the best are very like one another. The fire-escape generally used by the London Fire-brigade (fig. 4) consists of a main ladder, the sides of which are

Fig. 4.  
Messrs Shand, Mason, & Co.'s London Fire-escape.

strengthened with patent wire-rope, and fitted with an unflammable trough of copper-wire netting, in which persons may slide with ease and safety from a window to the ground; a fly-ladder, jointed to the main ladder, along which it lies when not in use, and raised when required by ropes and levers; a third or detached piece called the first-floor ladder, which when not in use is carried under the main ladder, but can be jointed to the end of the

fly-ladder; and a fourth piece known as the supplemental length, which can be added when the greatest total height (60 feet) is required. The whole is mounted on a light carriage with springs and high wheels, and can be moved anywhere by two men. The fly-ladder is constructed so as to be immediately detached for use in narrow courts, alleys, &c., or it can be used as an independent means of escape when not required on the main ladder, forming with the detached ladders four distinct means of escape from burning buildings. When required, the fire-escape is run to the burning house, the main ladder standing nearly upright all the while. It is then directed to the required window at a considerable inclination, and the fireman ascends the ladder, and either helps the inmates to descend by it, or, if they are unable to do this, he lets them down by the trough, which forms an inclined plane along which they may easily and safely descend with the aid he is enabled to afford them.

**Notable Fires.**—The following is a list of notable fires:

|       |                                                                            |
|-------|----------------------------------------------------------------------------|
| A.D.  |                                                                            |
| 64    | Rome burned for eight days, five-sevenths of the city destroyed.           |
| 1080. | London.                                                                    |
| 1212. | London.                                                                    |
| 1666. | London, the Great Fire, September 2-6; 496 acres swept; loss, £10,750,000. |
| 1794. | London.                                                                    |
| 1812. | Moscow fired, September 14-20, 1812, £30,000,000.                          |
| 1835. | New York, December 10; loss, £3,000,000.                                   |
| 1842. | Hamburg, May 6-7; loss, £7,000,000.                                        |
| 1845. | New York, July 20; loss, £1,500,000.                                       |
| 1861. | London, Tooley Street, 22d June to 22d July 1861, £2,000,000.              |
| 1871. | Paris, Communist outrages in May; loss, £32,000,000.                       |
| 1871. | Chicago, October 8-10; over an area of 212½ acres; loss, £39,000,000.      |
| 1872. | Boston, U.S., November 6-10; loss, \$15,000,000.                           |
| 1882. | London, Wool Street, December 8-10; loss, £1,000,000.                      |

Eyró M. Shaw, *Fire Protection: Manual of Organisation, Machinery, Working, &c. of the London Fire-brigade* (now ed. 1889), as also his *Records of the late London Fire Establishment, Fire Surveys, Fires in Theatres, and Fires and Fire-brigades*.

**Firearms.** The generic term 'firearm' includes Cannon, Rifles, Guns, Revolvers (q.v.), and other weapons in which an explosive is used as an agent for the propulsion of projectiles. The history of the invention of Gunpowder (q.v.) is an appropriate prelude to that of firearms, the existence of the latter being wholly dependent upon the discovery of a certain recondite quality in the former.

Inflammable material has been employed in warfare from remotest antiquity; sulphur and resinous gums were the ingredients of some, and naphtha and bituminous substances with nitro or other, of the mixtures known to the ancients as 'Greek fire,' 'wild-fire,' or 'Medea's oil'; but the vessels in which these inflammable compounds were degenerated cannot properly be termed firearms.

A weapon of the pyrotechnical species was developed by some of the eastern nations, and is said to have been used extensively until the 15th century for the frightening of horses and cattle on pillaging expeditions and in warfare. The weapon was in construction similar to a 'Roman candle' of the pyrotechnists, the inflammable filling of Grecian wax and metal filings being alternated with layers of gunpowder and balls of tow mixed with sulphur; the weapon was lighted at the muzzle, and as the 'filling' burned down, the balls were shot out by the gunpowder immediately beneath them.

The knowledge of gunpowder and firearms may be presumed to have extended in a westerly direction through the Arabs, who used them in the 8th century under the name of 'manjaniks,' and introduced them into Spain in the 13th century. Seville was defended in 1247 by cannon throwing stones; Niebla in 1259; and in 1273 Abu Yusuf employed cannon firing stone balls at the siege of Sidi-Moussa, near Algiers. Ghent possessed a small cannon in 1313, and Florence ordered cannon and iron balls about 1325. In Germany, Amberg possessed a cannon in 1301, and in 1327 the English employed some Hainaulters, who used cannon for King Edward III. against the Scotch. Cannon were used in 1339 at Cambrai, in 1340 at Mirepoix, in 1345 at Monségur, in 1346 at Crécy. In 1350 some North German knights armed themselves with iron guns, and in 1365 Einbeck was very effectually defended with the aid of firearms.

Different countries had different names for these early firearms—in Italy 'bombardo,' in France 'quenon,' in Germany 'buchsen,' in the Netherlands 'vogheleer,' in England 'crackkeys' or 'engynnes' of war; but it was not until the 15th century that firearms were classified and named accordingly. *Bombards* were short, capacious vessels, from which stone balls were shot with small charges to a short distance and at considerable elevation; they were essentially the parents of the present bombs or mortars. The *cannon* (*canna*, 'a reed'), on the other hand, were, for some time at least, of extremely small bore, scarcely larger than muskets of the 18th century; they discharged leaden bullets, and would have probably been used as hand-weapons but for their enormous and heavy workmanship, which necessitated small carriages. Aims of this description are doubtless those referred to as having been brought by Richard II. to the siege of St Malo, to the number of 400 pieces, where they are said to have kept up an incessant fire day and night on the town without success.

Fig. 1.

a (from the *Chroniques de St Denis*, 14th century; b, bombard of the 15th century (from Froissart); c, cannon of the 15th century (from *Les Vigiles de Charles VII.*).

All these early firearms were usually loaded to the muzzle, and fired at an extreme angle. Charles V. classed mortars separately, mounted cannon upon carriages, added tunions, and effected other improvements in his artillery, which consisted of cannon; great, bastard, and small culverins; falcons and falconets. The classification of firearms led to the development of various types to be used for specific purposes, and an invention which effected a great improvement to one type was useless or inapplicable to another. Cannon of 120 tons and pocket-pistols of 4 ounces, although they have a common origin, have not a common history. Cannon were of wrought iron, built up

by the handicraft of the smith, of rods and rings, and were used as they left his forge. Cannon of a copper and tin alloy were cast at Augsburg in 1378; they have since been made of hollowed blocks of stone; or cylindrical holes, bored in the solid cliffs, have been used to fire projectiles, as at Alexandria, Constantinople, and Gibraltar; they have been made of wood, of rope, of leather, and of papier-maché, as well as of almost every pure and alloyed metal it is possible to cast or forge. The early cannon were chiefly used at sieges, as their weight and the badness of the roads, added to the inefficiency of the weapons themselves, precluded their advantageous use as field-pieces, and if utilised in a pitched battle they were fired but once. But on the one hand the development of cannon into small portable weapons produced hand firearms, and on the other the increase of size and weight led to the large weapons so important for the defence of fortifications. Of this type the 'Mons Meg' of Edinburgh Castle is an early specimen; it weighs nearly 4 tons, and fired a stone shot of over 300 lb. The powder-chamber is of a less diameter than the bore of the cannon, in this particular resembling the mortar, and exhibiting the reverse of the principle of enlarged powder-chamber now employed. Such cannon were made at Ghent in the 15th century.

The culverin, a useful size of cannon, was employed generally in England until after the Commonwealth. Culverins fired stone shot, iron

Fig. 2.—German Breech-loading Cannon of the 16th century.

balls, leaden bullets, and composite projectiles—a leaden jacketing being cast round uneven stones to make them heavier, and the better to fit the interior of the cannon.

Such culverins and projectiles were made by the blacksmiths of Deritend, Birmingham, in the 17th century, and were used at the battle of Worcester. Field-pieces were not greatly developed until the 18th century, when the improved finish of the interior allowed of long and uniform ranges, and a certain definite accuracy being obtained. The breech-loading field artillery are now of a high degree of excellence; but whether firing shot or shell the limit of power will be found in recoil, as is the limit of accuracy in the correctness of the aim.

For defensive purposes, as well as for certain offensive operations, special arms were required and constructed: of these the long-barrelled wall-pieces for defence; the 'petard,' and mortars firing bars, oblong and square bullets, for making a breach; explosive shells and grenades for clearing a trench; grape and chain shot for mowing down compact squares of infantry or destroying the rigging of battle-ships, are the best known. From the 'orgue de bombardes,' another type of early firearm, the quick-firing, many-barrelled machine guns have been developed. The earliest form of this weapon is the 'ribaudequin,' of Italian origin, which consisted of a number of small cannon and pikes arranged upon a portable carriage; it was fired but once during an engagement, and was primarily intended as a defence against a cavalry charge. The 'orgue de bom-

bardes' (fig. 3), with more cannon (fired simultaneously) and fewer pikes, succeeded the ribaudequin.

Fig. 3.—French Orgue des Bombardes.

Further developments survived into the era of percussion firearms.

With the cannon and quick-firing machine guns, the improvements have depended less upon the ingenuity of inventors than on the achievements of mechanical science to accomplish accurate workmanship, and work great masses of material as skilled workmen can handle smaller pieces. The improvements in explosives, in the quality of the metal, and in the machinery available, have rendered possible the production of such immense weapons, that the limit of size would appear to be rather in the cost of manufacture and the enormous expenditure risked upon the aim, than in the inability of modern mechanicians to produce still larger and more powerful weapons (see CANNON).

The development of the hand firearm, on the contrary, called for the ingenuity of the handicraftsman, and at first this ingenuity was exercised in the combination of a firearm concealed with some other weapon, so that its firing unexpectedly

Fig. 4.—Pistol Battle-axe.

should produce a consternation; and for the same reason repeating and double-barrelled weapons were produced. Firearms were incorporated with daggers, swords, pikes, clubs, maces, axes, and shields; and it was the use of these devices by cunning warriors that disgusted the knights and led to their loss of prestige, and hastened the decay of feudalism. The hand firearms owed their success quite as much to the consternation caused by their unexpected discharge as to the execution done by their projectiles: hence Montaigne wrote in 1585, when the muskets in use were much superior to the earlier culverins, that their effect, apart from the shock caused by the report, was so insignificant that he hoped the use of them would be discontinued. It was as a surprise weapon that Neapolitan brigands and French postillions were armed with whips, the handles of which were cunningly devised and well-hidden pistols.

The culverin or hand cannon was a small tube of  $\frac{1}{2}$  or  $\frac{3}{4}$  inch internal diameter, fixed to a straight piece of wood or welded to an iron handle. At the close of the 15th century they were extensively used. In 1471 culverins were in the army of Edward IV. after his landing at Ravenspur, Yorkshire; and hand firearms were used at the siege of Berwick in 1521. The smallest hand-culverins—about 4 feet in length and weighing 15 lb.—were used on horseback; heavier weapons up to 60 lb. weight were used

by the foot-soldiers. The enlveriner was attended by a 'varlet' to aid in firing the piece, which was always supported upon a forked rest. The arquebus

Fig. 5.—Early Hand-culverin.

was a smaller and improved culverin, requiring but one man. Grose writes of the equipment of the enlveriner: 'He had, in addition to the unwieldy weapon itself, his coarse powder, for loading, in a flask; his fine powder, for priming, in a touch-box; his bullets in a leathern bag, with strings to draw to get at them; whilst in his hand were his musket-rest and his burning match.'

The touch-hole of the enlverin was in late patterns placed in the side, instead of on the top as with cannon, a flash-pan was added, and early in the 16th century the serpentin or lever to hold the burning match was invented, and the matchlock quickly followed. In the best matchlocks the flash-pan was covered with a hinged lid, and the serpentin was forcibly thrown upon the touch powder in the flash-pan by a spring; but in the ordinary types the burning slow match was made to descend by pulling the lower end of the serpentin towards the stock. From the matchlock arquebus came the hagbut, hackbutt, haackenbuse, and the musket, which was originally a heavier weapon, and carried a double bullet. These early firearms were loaded with difficulty; at Kissingen in 1636, and at Wittenmergen in 1638, the musketeers fired seven shots in eight hours, which is accounted for by the fact that musketeers were harassed by the opposing cavalry

Fig. 6.—Early Matchlock-gun.

and archers, and that the loading had to be effected whilst the forked-rest was attached to the wrist by a short thong, and the soldier 'in skinnish doth charge his musquet afresh, and train his forke or staffe after him.' The matches of slow burning fuse, even when carried in the hat, or in a perforated metal case at the girdle, gave much trouble, especially in wet and foggy weather, and at the battle of Dunbar (1650) the English musketeers were unable to retain their fire on account of the weather. The *wheel-lock* originated from a gun in which pieces of pyrites were placed near the flash-pan, and the igniting spark was produced by the friction of a file rubbed against them. In the wheel-lock the flint is held in the flash-pan by a spring pressing against the opposite extremity of the lever to the one in which the flint is fixed; in the flash-pan is a grooved wheel with serrated edges, which is rapidly rotated by a chain and flat or V spring, or as is the drum of a watch. The wheel was wound up as in a watch, with a movable key, and was released upon the trigger being pulled; its rapid rotation against the flint firmly pressing upon it produced a stream of sparks instantly, and made ignition more certain. The wheel-lock was produced in Germany early in the latter half of the 16th century, and with its introduction the use of firearms for sporting purposes became more general.

The *firelock* or flintlock, more common than the expensive wheel-lock, was produced in Spain about 1625, as a cheap substitute for the wheel-lock. In the flintlock the *hammer* or cover-plate to the flash-pan is knocked backwards by the blow of the flint screwed in the jaws of the *cock*, and, uncovering the priming in the flash-pan, exposes the touch powder to the sparks produced by the flint grating against the steel face of the hammer. The early flintlock was clumsy, simple, and inefficient; it is said to have been produced by marauders, to whom the burning match of the arquebus was dangerous as betraying their presence; and, roughly made, it did not answer as a military weapon so

Fig. 7.  
French Flintlock Breech-loader, 18th century.

well as the matchlock. Improvements in the latter half of the 17th century caused its more general adoption. It was common in the Netherlands, and was introduced into the English army in the reign of William III., and remained in use until 1840; the last firelocks supplied to the British government were for use abroad, and were made in 1842. The firelock or flintlock musket is still an article of commerce, as it can be used wherever there is a supply of powder and lead. The flintlock in its highest degree of perfection was manufactured in London as a double sporting weapon at the beginning of the 19th century.

*Pistols* were developed from the small hand cannon termed 'poitrinal,' and were made in 1540 by Camillio Vettelli at Pistoia. They were used as concealed weapons, the German Ritters being the first to adopt them for military purposes. At the battle of Renty in 1554 the Ritters defeated the French through a manœuvre termed 'caracol,' in which the pistols played the most important rôle. The pistols, from having short barrels and heavy, clumsy butts, improved into successful cavalry arms when furnished with wheel-locks, and they were generally adopted as an auxiliary weapon. Double and four-barrelled pistols were common in the 18th century, and the revolving pistol, termed the 'pepper-box,' preceded the introduction of the modern revolver by Colonel Colt (see REVOLVER).

As a triumph of handicraft and exact workmanship the duelling pistol is without a rival, and the twenty-pair pistols firing a large bullet with a small charge of powder, as made in Paris at the present time, are not to be equalled as weapons of precision by any firearm extant. The revolver has superseded the pistol entirely for military and police purposes in civilised countries, but the revolver will in its turn have to make way for a magazine or repeating pistol.

Many of the early cannon hand-forged from rings and bars were breech-loading, the system employed being that of the movable breech-block,

secured in position during the discharge by hammer-driven wedges; or a through pin uniting the block with the breech flange of the cannon. Such weapons date from the 14th century, and similar weapons formed part of the equipment of the *Mary Rose*, which foundered about 1545. Small-arms intended for the use of illustrious persons were occasionally made breech-loading. In the Tower collection is a musket which closely resembles the modern Snider in its breech mechanism, and this remarkable specimen of an efficient breech-loader is said to have belonged to Henry VIII., whilst several other varieties of arms having a movable breech-block were made prior to his reign. Small-arms and cannon with detachable breech-plugs—in which the charge was placed and fired—were made in the 16th century, and before its close breech-loaders with hinged barrels had been introduced. The hinge was usually at the joint, as in the weapon illustrated (fig. 7), and not a couple of inches forward of it, as in the Lefauchaux and other modern developments of the sporting gun. The 17th and 18th centuries were particularly prolific in the production of breech-loading mechanisms, but, owing to the absence of a cartridge containing its own ignition, none were successful until revived after the introduction of the percussion cap.

Amongst the early manufacturers of arms who aided the development by their handicraft or invention the Italian and Spanish smiths deserve mention; the accurately forged barrels of Nicolas Bis, and the fine workmanship on the pistols of the Cominazzo family, cannot be surpassed. Köllner of Vienna, and Kötter of Nuremberg, produced rifling; and Lazarino, Day, and Nereiter improved the appearance and handiness, and added to the utility of firearms by minor inventions. The wheel-locks were neither manufactured nor used extensively out of Germany and Italy, but the Saxon collection in the Dresden Museum indicates the importance with which the invention was once regarded. The most curious arms were manufactured in Paris, Amsterdam, Hanover, Liège, and Lisbon, and later at the Moscow arsenal.

That necessity is the mother of invention has never been more truthfully demonstrated than by the development of firearms. The wars in Flanders and Germany during the middle ages quickened the genius of their inventors and improved the skill of their armourers; just as the tension in mid-Europe since the war of 1870-71 has given to France and Germany the finest repeating rifles and best artillery; whilst the leisure and taste of the Englishman has called for the finest sporting weapons. The invention of rifling in Germany in the 15th century led to the development of weapons of precision, the highest degree of accuracy being attained by a heavy muzzle-loading small-bore rifle with a high trajectory. The requirements of the military firearm—lightness, ease and quickness of manipulation, extreme range and great velocity, have led to the sacrifice of precision for the advantages possessed by light breech-loading arms (see BREECH-LOADING, and RIFLES).

Of the inventions which have been applicable to all firearms the most important has to do with the ignition of the charge of explosive. Fulminating or detonating powders were made by the French chemists of the 18th century; and about 1800 an Englishman, benefiting by their experiments, produced a highly sensitive explosive, composed of fulminate of mercury and saltpetre, which possessed all the requisite qualities of a priming powder for the flintlock firearms. In 1807 Alexander J. Forsyth, a Scottish clergyman, patented the application of the detonating principle for exploding gunpowder in firearms. Many inventors claimed the

copper percussion-cap which followed and was first made in England in 1818, its introduction leading to the abandonment of the flintlock. The expansive bullet, invented by Greeneer and improved by Minié, increased the range and accuracy of rifles, and made an accurate breech-loading rifle possible. The cartridge-case containing its own means of ignition, or the percussion-cap, is a French invention improved by Lefauchaux, Lancaster, Needham, Pottet, and others, and to it is due the success of modern breech-loading small arms, this cartridge-case of solid drawn brass being used for all quick-firing machine guns and some of the smaller cannon. The expansion of the case at the moment of discharge causes it to act as an obturator and block all escape of gas into the breech-loading mechanism, whilst its contraction after firing admits of its being withdrawn with ease.

Sporting firearms consist of the shot-gun and the rifle for large game shooting. The use of hail-shot became general in Germany in the 16th century, and with the introduction of the wheel-lock the use of the arquebuses for sporting purposes became more common. The earliest double-barrelled guns were made for military purposes, but sporting guns with two barrels side by side were made in Italy in the 17th century, and the art of shooting on the wing was first practised about 1580. The introduction of better forged barrels in the latter half of the 18th century made a light double-barrelled fowling-piece a possibility, and since then shot-gun barrels made of iron and steel fragments (1798) and twisted scelps (1806) have increased in strength and lightness. Old horseshoe nails and scraps of iron and steel were made into shot-gun barrels; but after 1850 new metal was employed and is now preferred. As the fowling-piece with hand-welded barrels made of twisted rods became more general, the supremacy of continental gun-makers over the English was lessened, and early in the present century the improvements made by Manton, Nock, Cook, Egg, and others placed English guns ahead of all competitors. The French invention of composite cartridge-case and breech-loading was tuned to practical account by the English, who have unceasingly improved upon the original idea. In addition to the breech-loading mechanism, the shot-gun has been improved in range by the use of choke-boring—i.e. the constriction of the barrel at the muzzle; in safety, by the rebounding lock, which again has been superseded by various hammerless locks, or arrangement of the firing mechanism within the head of the gun; and in self-ejecting mechanism. See BREECH-LOADING; also GUN (Sporting).

The sporting rifle is a type of firearm evolved from the wheel-lock hunting weapons of Germany. Its production is proof of the adaptability of firearms to special needs; the desiderata of a weapon for large game hunting include the quick firing of a second shot, and a paralysing effect from the penetration of the bullet. The repeating rifle cannot be twice fired as quickly as the double rifle, and length of range with a light ammunition and continuous quick firing are points sought in a military weapon. Precision is dependent upon the weight of the projectile being sufficient to maintain the direction imparted to it during its passage through the barrel. The bullet is helped to do this by the rifling giving the projectile a rotary motion, which equalises irregularities in the bullet, and lessens its tendency to deflect. The greater the velocity, the less quickly must the rifling turn; but with improved solid bullets, covered with nickel or steel, it is possible to get the bullet to grip the rifling at a velocity of 2000 feet per second, and a complete turn is made in ten inches, in which case the bullet has a double

rotary motion and takes a corkscrew flight. The modern sporting or express rifle, as it is termed, fires a hollow expansive bullet at a high velocity for a few hundred yards, accuracy and range being sacrificed to force at impact. The average muzzle velocity of the military rifle is 1500 feet per second, of the express 2000 feet per second; and although with new ammunition and improved explosives the latest military rifle attains this initial velocity, the force of the bullet on impact does not approach that of the sporting rifle projectile. The smallest sporting rifle fires a bullet of about 120 grains, and the largest a bullet of 1600 grains (see RIFLES). Firearms are also used for a variety of secondary purposes: for the firing of signal shells at sea (in lieu of rockets), shooting oil-filled vessels from ships to prevent the breaking of the waves in stormy weather, for firing harpoons with a line attached, as used in whale and narwhal fishing, &c.

In the manufacture of early firearms the smith was the first and last workman. The Italians were amongst the first to ornament firearms, and finish them by chiselling, chasing, and engraving, as the Spaniards were amongst the first to supplement the work of the smith by filing and smoothing the exterior of the weapons, and polishing the interior of the barrels. For the last three centuries the most skilled handier craftsmen of Europe have been employed in the making or beautifying of firearms, and at the present day the manufacture of sporting guns remains essentially a handicraft, the mechanical processes having but lightened the labour of the workman, not superseded him. Some 20,000 workmen are now employed in Europe in the manufacture of sporting guns, the chief centres being Birmingham, Liège, and Prague, whilst the machine factories of Europe, together with the government arsenals engaged in making small-arms, employ a much larger number. In addition to the places mentioned, at Suhl, St Etienne, Steyr, and Tula, and at Springfield, Hartford, and elsewhere in the United States, large numbers of firearms are made yearly. The idea of making army muskets with interchangeable parts originated with the French about a century ago, but the only successful result was the 'drop forging' or stamping out of the various limbs, and about 1797 Whitney made some 10,000 muskets in America from stampings, and used improved machinery in finishing the parts.

The perfecting of the machinery for the manufacture of interchangeable arms is the work of Hall, of Harper's Ferry, U.S., whose system was adopted in government workshops in 1818; and of Blanchard, whose improved lathes produced interchangeable stocks. The system of making firearms by machinery was introduced into England in 1856, since which date many futile attempts have been made in various countries to produce fine sporting arms wholly by machinery.

The improvements immediately sought in firearms are such as will tend to simplify or strengthen the breech-loading mechanism (see BREECH-LOADING), and to strengthen and at the same time lighten the barrel; the discovery of a material stronger than steel; and such inventions as will increase the range or precision of the weapon or lessen its recoil. For the capabilities of various weapons, see CANNON, RIFLES, REVOLVERS, &c.

The best military small-arms—rifles—are available to a range of 2000 yards, and the best express to 300 yards. A match-rifle will fire with a mean deviation of 1.75 feet or less at 1000 yards range, and a shot-gun will put upwards of two-thirds of its charge of shot into a circle thirty inches in diameter at 40 yards range, and the last shot of the charge will not be more than ten feet behind the first one that reaches the target at that distance.

The killing range of the average shot-gun is about 45 yards, of wild-fowling guns with swan shot 140 yards. After the pulling of the trigger, until the charge of shot reaches the muzzle, '007 of a second elapses, and .13 before the shot, having passed the muzzle, strikes the target 120 feet distant.

For the early history of firearms, see Grose's *Military Antiquities*; Wilkinson, *Engines of War* (1841); Greener, *The Gun and its Development* (1881). For modern arms, J. H. Walsh ('Stonehenge'), *Modern Sportsman's Gun and Rifle* (1882-84), and *Weapons of War* (1888); Greener, *The Gun* (1889 edition), and *Shot-guns* (1888). For firearms manufacture, Brandois, *Moderne Gewehr-Fabrikation*; and Greener, *The Gun*.

**PROVING OF FIREARMS, in Law.** All weapons manufactured or offered for sale in England must be proved either at one of the government proof-houses in England or at the Bane d'Eprouve at Liège. A royal charter granted in 1637 to the London gunmakers gave them powers to search for and prove and mark all manner of hand-guns, great and small dagges, and pistols. The several statutes of 1813, 1819, and 1855 rendering the proving of firearms compulsory have been superseded by the Gun-barrel Proof Act, 1868 (31 and 32 Vict.), regulating the duties and powers of the proof-houses in London and Birmingham (the only two in England). By this statute the forging or counterfeiting of the proof-marks or stamps is treated as a misdemeanour punishable by imprisonment for not more than two years; and a fine of £20 is imposed on any person selling or exposing for sale barrels not duly proved, or exporting or importing barrels with forged proof-marks. These penalties are to be levied on conviction before two justices or a metropolitan or stipendiary magistrate. The statute does not extend to Scotland or to Ireland, and arms manufactured for Her Majesty are exempted from its operation.

The introduction of new and more powerful explosives and guns of improved types has necessitated changes in the proof-house tests. The most important provides that weapons shall be tested with such explosives and projectiles as those with which they will be charged in actual use. Until April 1888, both shot-guns and rifles were tested with fixed charges of common gunpowder and leaden bullets.

**Fireball** is the popular name of projectiles, other than rockets, which are used for incendiary or illuminating purposes. They are more properly called *carcasses*, or *ground* and *parachute light-balls*. The carcass is a thick shell filled with fiercely burning composition, and having large holes, or vents, out of which this streams. The ground light-ball is filled with brightly burning composition, and burns on the ground. The parachute shell is fired from a mortar, and fuzed so as to open in the air and support, by means of a parachute packed inside it, a pan of brightly burning composition. The electric light has superseded these last two, and the rocket the first.—For another kind of fireball, see LIGHTNING.

**Firebote**, the right of a tenant, according to English law, to cut wood on the estate for the purpose of fuel. See ESTOVER.

**Fireclay** is the variety of clay which is used for the manufacture of firebricks, gas-retorts, crucibles, glass pots, chimney-pipes, and other articles, most of which require to resist the action of high and long-continued heat. Ordinary fireclay is chiefly found in beds not usually much exceeding two feet in thickness, in the coal-measures, interstratified with seams of coal and other rocks. In the British Islands it is most largely worked about Glasgow, Newcastle-on-Tyne, and Stourbridge in Worcestershire, at which last

place it is said to have been discovered about 1555 by some wandering glassmakers from Lorraine. But it occurs, more or less, in most places where true coal is found. It is mined in Germany, Belgium, France, the United States, and other countries. Stourbridge fireclay, owing to its excellent quality, is largely exported to foreign countries, as well as bricks and other objects made of it. Refractory clays are found, though more rarely, in other formations besides the coal-measures. For example, some of Tertiary age found in Dorsetshire and Devonshire are made into firebricks. The following table shows the principal constituents of fireclay:

|                     | No. 1. | No. 2. | No. 3. | No. 4. | No. 5. |
|---------------------|--------|--------|--------|--------|--------|
| Silica.....         | 65.10  | 59.49  | 53.52  | 54.20  |        |
| Alumina.....        | 22.22  | 28.75  | 33.63  | 33.50  |        |
| Potash.....         | 18     | ..     | trace  | trace  |        |
| Lime.....           | 14     | 1.46   | trace  | .70    | trace  |
| Magnesia.....       | 18     | 1.54   | ..     | .14    | .02    |
| Oxide of Iron.....  | 1.92   | 4.63   | 1.05   | .52    | .01    |
| Water.....          | 9.23   | 11.05  | 11.34  | 10.86  |        |
| Organic Matter..... | 53     | ..     | ..     | .15    |        |

No. 1, Stourbridge; No. 2, Newcastle-on-Tyne; No. 3, Gartsherrie, Scotland; No. 4, Poole, Dorsetshire; No. 5, Morgantown, West Virginia, United States. See CLAY.

Fireclays from the same locality often differ considerably in their composition and quality. Some of the Newcastle clays, for example, contain from 70 to 80 per cent. of silica with from 9 to 18 per cent. of alumina. A high percentage of silica and alumina together (their relative proportions being comparatively immaterial) and small quantities of alkaline substances and oxide of iron constitute a refractory fireclay. If not small in amount, alkaline bodies in the clay tend to make it easily fusible, so that bricks formed of it are apt to soften and yield in a furnace. Fireclays are generally yellow in colour after being fired in the kiln. No very sharp line of distinction can be drawn between hard infusible clays and softer marly clays used for terra-cotta, garden vases, and some kinds of house bricks. In districts where fireclay is abundant composition bricks for ordinary building purposes are partly made of it. For furnace-building materials which resist the action of a very intense heat, such as dinas and bauxite bricks, see BRICK-MAKING. Powdered flint, as well as chrome iron ore, is likewise used for furnace bricks.

**Firedamp** is the miners' term applied to light carburetted hydrogen or coal-gas when it issues from crevices in coal-mines (see GAS). These crevices are named 'blowers' by the miners, and are evidently the outlets of gas that exists in a compressed state in pores and cavities in the coal. The issue of the gas is in some cases audible, and on applying a light it burns as a jet of flame. When mixed with air in proportions between  $\frac{1}{4}$  to  $\frac{1}{5}$  of its volume the mixture is explosive, producing disasters that are too well known. The researches of Mr Galloway and others have shown that the gas is only one of the factors producing the worst catastrophes. A comparatively small explosion of gas stirs up any coal-dust that may be lying on ledges, or on the floor of roads and workings, each particle of dust is fired, and the combined result is like the firing of grains of gunpowder.

**Fire-engine, Fire-escape.** See FIRE.

**Firefly**, a name applied to many 'phosphorescent' insects, which are all included within the order Coleoptera, or beetles. Some of them (among the Elaters) give forth a steady light, and these may be distinguished as fireflies proper from the Glow-worms (q.v.) and 'lightning-bugs' (among the Lampyrids), which flash light intermittently. In the phosphorescent Elateridae, furthermore, the production of light has its seat more anteriorly

than in the Lampyridæ, where it is abdominal. As the Lampyrids will be discussed under GLOW-WORM, only the Elaterid fireflies need be noticed here.

The most brilliant fireflies are species of *Pyrophorus*, most at home in tropical America. One form—*Pyrophorus noctilucus*—common in the West Indies and Brazil, attains a length of about an inch and a half, and has a dark rusty-brown colour.

On the upper surface of the first ring of the thorax are two yellowish oval spots, which are brilliantly luminous during the nocturnal activity of the beetle, while on the first ring of the abdomen a still brighter organ is situated. Even the eggs are luminous, and excised portions placed in a damp chamber remain functional for two or three days. The pounded debris of the insect is also luminous. The luminous organs are special modifications of the epidermic (*hypodermis*) cells, which are disposed in two layers, of which the outer alone is luminous, while the inner contains masses of waste products, and is riddled by air-tubes. The luminosity depends on a process of oxidation; the oxygen is supplied by the tracheæ, and the brilliancy varies with the respiratory activity, being (according to Heinemann) only indirectly affected by the nervous system. What the substance oxidised really is remains undiscovered. On the sleeping or entirely passive insect a soft light may be observed; the real blaze is only exhibited during active respiration, and may be exaggerated experimentally by blowing in an extra supply of oxygen. Dubois's experiments seem to show that the fireflies utilise their phosphorescence to guide their steps.

Common Firefly (*Pyrophorus noctilucus*) in burrow of mole-criset, showing the two oval phosphorescent organs on the thorax.

The light of these living lamps, or *cucujos*, as the Mexicans call them, has frequently saved a traveller's life; the Indians 'travel in the night with fireflies fastened to their hands and feet, and spin, weave, paint, and dance by their light,' and they are often used for decorative purposes. A few of them in a glass vessel give light enough to read by, and when not wanted for any such purpose they may be set to catch mosquitoes in the house. In Vera Cruz, according to C. F. Holder, the *Pyrophori* are so commonly used as toilet ornaments that they form an important article of trade. The natives lure them by means of lights waved on the end of sticks, and catch them in nets. 'They are then placed in a box covered with a wire netting, bathed twice a day in tepid water, and at night fed with sugar-cane.'

See GLOW-WORM, PHOSPHORESCENCE; C. F. Holder, *Living Lights* (Lond. 1887); R. Dubois, *Les Elatrides lumineux* (Meulan, 1886); F. F. Moore, *Fireflies and Mosquitoes* (Lond. 1888); and numerous papers quoted by Holder. For a detailed account of the anatomy and physiology of *Pyrophori*, see C. Heinemann, *Archiv. f. mikr. Anat.* XXVII. (1886), pp. 296-382.

**Fire-insurance.** See INSURANCE.

**Firelock.** See FIREARMS.

**Firenzuola**, AGNOLO, Italian writer, was born at Florence, 28th September 1493. Having studied law at Siena and Perugia, he began to practise as an advocate in Rome. But in a few years he enrolled himself in the monastic order of Vallombrosa.

On the death of Clement VII. he left Rome, and finally became abbot of Prato, where, or at Rome, he died before 1548. His chief works are a spirited paraphrase of the *Golden Ass* of Apuleius, a work in close imitation of the *Decameron*, a eulogistic discussion concerning the charms of the fair sex, a couple of comedies, and some poems. Firenzuola's works are distinguished for the classic elegance of their style, as well as notorious for their licentiousness. The best collected edition is one published at Florence (2 vols. 1848).

**Fire-raising**, in the law of Scotland, is the equivalent term for Arson (q.v.) in England.

**Fire-ship**, a vessel, usually an old one, filled with combustibles, sent in among a hostile squadron, and there fired, in the hope of destroying some of the ships, or at least of producing great confusion. Livy mentions the use of such by the Rhodians, 190 B.C. Earliest in modern times, so far as known, they were employed by the Dutch in the Scheldt during the war of independence in the Netherlands, and shortly after by the English, in 1588, against the Spanish Armada. Lord Dundonald (q.v.) employed them against the French in 1809; and the Chinese tried them against the British fleet before Canton in 1857, but unsuccessfully. The service of navigating one of these ships into the midst of an enemy, there firing it, and then attempting to escape, is always fraught with great risk of failure and disaster.

**Fireworks**. See PYROTECHNY.

**Firishta**. See FERISHTAH.

**Firkin** (dim. from *four*), an old measure of capacity containing 9 gallons (old ale and beer measure). But previous to the year 1803 it had two values, being estimated at 8 gallons in old ale measure, and at 9 in old beer measure. The firkin is equivalent to 9½ imperial gallons. The name is also applied to a small wooden cask, as for butter. This contains 50 lb.

**Firiot** (from *four*), an old Scottish dry measure, of which there were four in a Boll (q.v.). Though differing in value for different substances and places, its relation to the boll remained invariable. See PECK.

**Firm**. See PARTNERSHIP.

**Firmament**, a word formerly used to signify the vault of heaven. The term found its way into English from the Vulgate, which renders the Septuagint *stereōma*, and the Hebrew *rakia*, by the Latin *firmamentum* (Gen. i. 6). *Rakia* (from the verb *rakca*, 'to beat or strike out') signifies whatever is expanded or stretched out, and was specially employed by the Hebrews to denote the hemisphere above the earth, compared (Exod. xxiv. 10) to a splendid and pellucid sapphire. Elsewhere (Ezek. i. 22-26) it is spoken of figuratively as that on which the throne of the Most High is placed. Hence it follows that the notions of solidity and expansion were both contained in the Hebrew conception of the firmament. The blue ethereal sky was regarded as a solid crystal sphere, to which the stars were fixed (compare the *cælo affixa sidera* of Pliny, ii. 39 and xviii. 57), and which was constantly revolving, carrying them with it. This sphere or firmament divided 'the waters which were under the firmament from the waters which were above the firmament;' and the theory of the phenomena of rain, &c. was that there were 'windows in heaven'—i.e. in the firmament, through which, when opened, the waters that were above the firmament descended. 'The same day were all the fountains of the great deep broken up, and the windows of heaven were opened' (Gen. vii. 11). The view entertained by the Greeks and other early nations was essentially the same. In the

progress of astronomical observations it was found that many of the heavenly bodies had independent motions, inconsistent with the notion of their being fixed to one sphere or firmament. Then the number of crystalline spheres was indefinitely increased, each body that was clearly independent of the rest having one assigned to it, till a complex system was introduced, capable of being fully understood only by the philosophers who formed it (see PROLEMAIC SYSTEM). It was long before men conceived the idea of the possibility of a body being maintained in motion in space without a fixed support, and, considering the number of phenomena of which the hypothesis of a crystalline firmament offered an apparent explanation, we must regard it as having been in its day a curious and ingenious speculation.

**Firman**, a word of Persian origin, signifying an order, and used by the Turks to denote any official decree emanating from the Ottoman Porte. The right of signing any firman relating to affairs connected with his special department is exercised by every minister and member of the divan, but the office of placing at the head of the firman the *tughra*—a cipher, or monogram, containing the names of the sultan and of his father in interlaced letters, and which alone gives effect to the decree—is committed to the hands of a special minister, who is called *nishānji-bashi* (see S. Lane-Poole, *Turkey*, in the 'Story of the Nations' series). The name applied to such decrees as have been signed by the sultan himself is *hatti-sherif* (properly *Khatt-i sherif*). The name firman may also signify a more formal kind of Turkish passport, which can only be granted by the sultan or by a pasha.—A written permission to trade is called in India a firman.

**Firminy**, a town in the French department of Loire, 9 miles S.W. of St Etienne by rail. Near it are rich coal-mines; and nails and other iron goods, ribbons, and buttons are manufactured in large quantities. Pop. (1872) 8873; (1886) 12,415.

**Firola**, a genus of free-swimming marine gastropods, in the division known as Heteropoda (q.v.).

**Firozabad**, a town of India, North-west Provinces, 24 miles E. of Agra, with numerous ruined buildings. Pop. 16,023, two-thirds Hindus, who carry on a little trade.

**Firozpur**, or FERROZPORE, a town in the Punjab, 3½ miles from the left or south-east bank of the Sutlej. Founded, it is said, by Firoz Shah (1351-87), and at one time a large and important town, it had sunk into poverty and insignificance before it actually came, in 1835, into the possession of the English. Since then the place has regained much of its former consequence, and it possesses the largest arsenal in the Punjab. It contains a church built in memory of those who fell in the Sikh wars (1845-46). Pop. (1881, including cantonment 2 miles south, 18,700), 39,570.—Firozpur district has an area of 2752 sq. m., and a pop. (1881) of 650,519 (549,253 in 1868). Much has been done, since British occupation, to increase the value of this once dreary and desert plain, by tree planting and otherwise, and now 76 per cent. of the district is under cultivation.

**Firozshah**, a battlefield in the district of Firozpur, 12 miles from the left bank of the Sutlej, the scene of the attack of the British forces, led by Sir Hugh Gough and Sir Henry Hardinge, on the Sikh camp, December 21, 1845. The entrenchments were carried and the natives routed after two days' fighting.

**First-born** (Heb. *bekor*, Gr. *prōtotos*, Lat. *primogenitus*), in scriptural use, signifies the first

male offspring, whether of man or of other animals, due to the Creator by the Mosaic law as a recognition of his supreme dominion. The first-born male, whether of men or of animals, was devoted from the time of birth to God, and the first-born male child had to be redeemed one month after birth by an offering not exceeding in value five shekels of silver (Exod. xiii. 13), provided the child lived longer than that period. The first-born male of animals also, whether clean or unclean, was equally regarded as devoted to God; that of clean animals, if free from blemish, was to be delivered to the priests within twelve months after birth, to be sacrificed to the Lord; nor was it permitted to any but the priests to partake of the flesh of such victims. If the animal were blemished, it was not to be sacrificed, but to be eaten at home. The first-born of unclean animals, again, was either to be put to death or to be redeemed with the addition of one-fifth of its value; if not redeemed, to be sold, and the price given to the priests. By the Mosaic law primogeniture had certain privileges attached to it, the chief of which were the headship of the family and a double portion of the inheritance. Among other nations considerable variety existed as to the succession of children to the inheritance of their parent, for the discussion of which see the articles *ENTAIL*, *FAMILY*, *FEUDALISM*, *LAND-LAWS*, and *SUCCESSION*.

**First-fruits** (Heb. *reshith*; Gr. *protogennemata*, and *aparchai*; Lat. *primitivæ*), that portion of the fruits of the earth and other natural produce which, by the usage of the Jews and other ancient nations, was offered to God as an acknowledgment of his supreme dominion, and as a thanksgiving for his bounty. Among the Jews the institution of first-fruits comprised both public and private offerings. Of the former the three principal were made at the opening of the corn-harvest, at the Feast of Pentecost, and at the Feast of Tabernacles. The private offerings made by individual Jews were a cake of the first dough of the year and the 'first of all the fruits.' All these offerings were divided into two classes: *Bicurim*, comprising the various kinds of raw produce, of which, although the law seems to contemplate all fruits, seven sorts only were considered by the Jewish doctors to fall under the obligation of first-fruit offering—viz. wheat, barley, grapes, figs, pomegranates, olives, and dates; and *Terumoth*, or the produce of the year in the various forms in which it is prepared for human use, as wine, wool, bread, oil, date-honey, dried onions, and cucumbers.

Offerings analogous to the Jewish first-fruits became usual very early in the Christian church, as is clear from a passage in Irenæus, but appear to have been merged in the legal provision established by the emperors. The medieval ecclesiastical impost known under the name of *primitivæ* or first-fruits, and sometimes of *annates* or *annalia*, was entirely different. See *ANNATES*.

**Firth**, or *FRITH*, an estuary, from the same root as *ferry*; Dan. *fiord*; akin to Lat. *portus*, and Gr. *porthmos*. For the Norwegian fiords, see *NORWAY*.

**Firth**, MARK, born in 1819 at Sheffield, in 1849 with his father and brother established there the great Norfolk steel-works, whose specialty soon became the manufacture of steel ordnance. He was a munificent benefactor to his native town, his gifts including almshouses (1869), a public park (1875), and the Firth College (1879) in connection with university extension (see *SHEFFIELD*). He died 28th November 1880.

**Fisc** (Lat. *fiscus*, 'a wicker-basket'), an old term for a prince's treasury. The word 'fiscal' is a derivative; as also Procurator-fiscal (q.v.).

**Fischart**, JOHANN, one of the most original German satirists, known also under the name of Hildrich Ellopos-kleros, was born either at Mainz or Strasburg, about the middle of the 16th century. He was brought up at Worms, studied law at Strasburg, became in 1581 advocate to the Imperial Chamber at Spire, and in 1585 bailiff of Fölsach near Saarbrücken, where he died in the autumn of 1589. Of the very numerous writings which appeared from 1570 to 1590, partly under his own and partly under fictitious names, about fifty have been proved to be on the whole genuine, though disfigured by interpolations. In respect to others, however, the authorship is doubtful. His most celebrated works are based on foreign models, particularly Rabelais, but manifest no servile imitation: a free creative genius everywhere works plastically on the materials. To this class belong his *Aller Practick Grossmutter* (1572); *Affentheurliche Geschichtschrift vom Leben der Helden Grandgusier, Gargantua und Pantagruel* (1575); *Podagrammisch Truchlein* (1577); and *Bienckhorb des Heyligen Romischen Inmenschwarms* (1579). These writings are wholly satirical. With the most inexhaustible humour he lashes, now the corruptions of the clergy, now the astrological fancies, the dull pedantry, or other follies, public and private, of the time. Next to these stands the outrageously comic work of Fischart's—quite original in its conception—entitled *Flokhatz, Weibertratz* (1573). Essentially different in its homely and simple tone is *Das glückhafte Schiff von Zurich*, written in verse, and published in 1576. Similar in point of style are his *Psalmen und Geistliche Lieder* (1576). The rest of Fischart's numerous writings, partly in prose, partly in verse, are of unequal merit, singularly varied in style and contents; but throughout all we find the same rich satirical humour, the same warm and genuine feeling for the moral foundations of all public and private life—religion, fatherland, and the family. His works are, moreover, one of the richest sources for the manners of his time. In his treatment of the language no German author can be compared with Fischart, not even Jean Paul Richter himself. He coins new words and turns of expression without any regard to analogy, but nevertheless displays the greatest fancy, wit, and erudition in his most arbitrary formations.

See Vilmar, *Zur Literatur J. Fischarts* (2d ed. 1865); Von Meusebach's *Fischart-studien* (edited by Wendeler, 1879); and Ganghofer, *Johann Fischart und seine Verdeutschung des Rabelais* (1881).

**Fischer**, ERNST KUNO BERTHOLD, the son of a country pastor, was born in the Silesian village of Sandewalde, July 23, 1824. From the Posen gymnasium he passed to the university of Leipzig, where he attended lectures on philology and theology; but after his first session he went to Halle, and here, under the influence of Erdmann and Schaller, becoming interested in philosophy, he resolved to devote himself to this as his life-study. He took his Ph.D. degree in 1847, and in 1850 established himself at Heidelberg as a *privatdozent* of philosophy. His eloquence and his poetical sympathies, in addition to his actual knowledge of philosophy, now stood him in good stead. Students came in flocks to hear him, and his enormous popularity, resulting from his enthusiasm, deep insight, and clearness of exposition, increased steadily. Suddenly, however, in July 1853, presumably because of private charges of pantheism made against the first volume of his *History of Modern Philosophy*, the Baden government without any explanation deprived him of his position as *privatdozent*. During three years of academic exile that followed, Fischer lived quietly with kindred spirits

amid the beautiful surroundings of Heidelberg, and continued meantime to work at his History, publishing between 1853 and 1856 the volumes on Spinoza, Leibnitz, and Bacon. In 1856 he received a call to Fichte's old chair of philosophy at Jena; and in Jena he laboured for sixteen years. At last, in 1872, when Edward Zeller succeeded Trendelenburg at Berlin, Fischer—all practical difficulties in connection with the freedom of lecturing having now disappeared—obtained Zeller's post at Heidelberg.

Fischer's chief work is his great history of modern philosophy, *Geschichte der Neuern Philosophie* (1852-77). It consists of six parts, several of which are subdivided into various volumes. The parts treat respectively of (1) the Cartesians and Spinoza, (2) Leibnitz, (3) Bacon and his successors, (4) Kant, (5) Fichte, (6) Schelling. Fischer's historical books are for modern philosophy what Zeller's are for old-world systems. His other great philosophical achievement is his *System der Logik und Metaphysik* (1852; new ed. 1865), in which, while he adheres in the main to Hegel's position, he yet criticises Hegel severely on many important points. Of his numerous smaller literary and philosophical writings the most noteworthy is a *Critique of Kant*, which, like *Descartes and his School*, has been translated into English. Other works deal with Goethe's *Faust*, Goethe's *Iphigenia*, and Lessing. Fischer is recognised as one of the leaders of speculative thought in Germany.

**Fish.** HAMILTON, American diplomatist, was born in New York city in 1808, graduated at Columbia, and was admitted to the bar there in 1830. A Whig in politics, he was elected a congressman in 1842, lieutenant-governor of the state in 1847, and governor in 1848. In 1851 he was returned to the United States senate, where he acted with the Republican party. He was secretary of state under Grant from 1869 to 1877, signing, as one of the commissioners, the Washington Treaty of 1871, and carrying through the settlement of the Alabama Question (q.v.).

**Fish-culture.** See PISCICULTURE.

**Fisher,** a North American carnivore. See PEKAN.

**Fisher, JOHN,** Bishop of Rochester, was born about 1400 at Beverley, Yorkshire, and in 1483 entered Michael-house, Cambridge, of which he became a fellow in 1491, and master in 1497. In 1502 Margaret, Countess of Richmond (1443-1509), Henry VII.'s mother, was led by his virtues and learning to make him her chaplain and confessor; and in 1503 he was appointed first Lady Margaret professor of Divinity. Next year he was elected chancellor of the university, and consecrated to the see of Rochester. Thirty years he laboured diligently for the welfare of his diocese and university. A friend of More and Erasmus, a man who at forty-six began Greek, at fifty Hebrew, he zealously promoted the New Learning, and advocated reformation from within; as zealously both by voice and by pen he resisted the Lutheran schism. So early as June 1527 he pronounced firmly against the divorce of Henry VIII., and having lost too ready an ear to the 'revelations' of the Holy Maid of Kent, Elizabeth Barton (q.v.), in March 1534 he was attainted of misprision of treason, and next month, for refusing the oath of succession, was sent with More to the Tower. In May 1535 the new pope, Paul III., made him a cardinal; Cromwell told it to Henry. 'Yea,' said the king, 'is he yet so lusty? Well, let the pope send him a hat, but I will so provide that he shall wear it on his shoulders, for head he shall have none to set it on.' He kept his word. On 17th June

the old man, worn by sickness and ill-usage, was tried for denial of the king's supremacy; on the 22d, still cheerful and courageous, he was beheaded on Tower Hill. His head was set high on a pole upon London Bridge; his body, after lying stripped naked till nightfall, was buried first in a neighbouring graveyard, and later in the chapel, within the Tower, of St Peter ad Vincula. In 1886 he was beatified. See MORE (SIR THOMAS); and the Rev. T. E. Bridgett's *Life of Blessed John Fisher* (1888).

**Fisheries.** In almost every part of the world fishes form some portion of the food of mankind, but they form a much more important part of the food-supply in the northern temperate regions than in the tropics or the southern hemisphere, and they are obtained in enormously greater abundance from the sea than from inland fresh waters. Hence it has become customary by a metaphor to speak of the 'harvest of the sea.' It is only within the last century, if we except the fish-ponds of the medieval monasteries and the culture of fresh-water fishes in China, that attempts have been made to control the conditions under which valuable fishes live and multiply. It is impossible in most cases to feed and protect aquatic animals with the same completeness as domesticated land animals. The cultivation of the former consists chiefly in artificially securing the production of large numbers of young, then setting them at liberty, and endeavouring to promote an abundant supply of their natural food, to destroy their enemies, and remove all unfavourable conditions. In this way the supply of salmon and some other fish and of oysters has been in some places largely increased—oysters especially in France and Holland, salmon and other fish chiefly in the United States. But no exclusively marine species has yet been successfully cultivated on a scale large enough to be of practical importance, and it is still an open question whether scientific methods can be applied to increase the supply of valuable marine fish diminished by excessive fishing. See PISCICULTURE.

But although marine fishes are produced in enormous abundance without human aid or foresight, the amount of labour and capital required to capture them is very large. Sea-going vessels and boats are themselves costly machines, and other elaborate and expensive machinery has to be carried and worked on board of them; the vessels and gear have to sustain very hard wear; both are frequently damaged, the gear being often, and the vessels sometimes, lost altogether. The capture of fish and their consumption have enormously increased in Europe and North America since the beginning of the age of steam. This increase is due to the great increase of population, and the consequently increased demand for cheap and palatable food, and to the facility afforded by the railways for conveying fresh fish to the large inland towns.

Nearly all the most abundant marine fish on the coasts of Europe and North America are valuable as food, some being held in great estimation as delicacies by the rich, others forming a staple food of the poor. The chief exceptions are the dog-fishes, which are extremely abundant and at the same time of no value as food, although they are occasionally eaten in some places on the coast. The other most valuable marine animals on the European coasts are the lobster, crab, crayfish, shrimps, and prawns among Crustacea, and certain molluscs, chiefly the oyster, though mussels, clams or scallops, and whelks are of some value. Except in extensive fresh-water lakes, true fresh-water fishes are of minor importance, but there are several valuable 'anadromous' fish which ascend rivers to a greater or less distance. The most important of

these are the salmon and sea-trout, but the smelt and shad are abundant in some estuaries of Europe, and another species of shad (*Clupea sapidissima*) is abundant and highly valued in America. Eels also are largely eaten in Europe, and the sturgeon, though rare in Britain, is abundant in some large rivers of the Continent.

The following are the principal different kinds of sea-fishing carried on in the United Kingdom: (1) trawling, (2) line fishing, (3) drift-net fishing, (4) seine-net fishing, (5) moored-net fishing, (6) eel and lobster fishing, (7) oyster-dredging.

(1) *Trawling* here means fishing with the beam-trawl, which is a triangular bag-like net towed along the sea-bottom. The mouth of the trawl-net is attached to a frame, consisting of a long wooden beam supported by a triangular hoop of iron at each end. These trawl-heads, or runners, glide along the ground, and raise the beam three to four feet above it. The upper side of the net is attached to the beam, the sides to the trawl-heads, while the lower edge of the mouth of the net is formed by a thick and heavy rope which is a great deal longer than the beam, and thus lies on the bottom between the irons in a deep curve or bight. As the net is towed along, the ground-fish are disturbed, and rise above the foot-rope, and, being prevented from escaping by the upper side of the net, they are swept into its narrow end, where their escape is made still more difficult by a constriction of the cavity of the net somewhat in front of its closed end. The size of the trawl varies according to the size of the vessel working it, but for deep-sea fishing the beam is 36 to 50 feet long, and the mesh of the net is always about 4 inches at the mouth to 1½ inch at the 'cod' end. The trawl is towed by means of two 'bridles,' which are long ropes of equal length attached one to each trawl-head, and a very strong, thick rope, the 'warp' or 'rude,' the end of which is fastened by a shackle to the two bridles.

The majority of trawling vessels are sailing boats, but recently steamers have been used in several places, especially in Scotland. The sailing boats range from 30 to 80 or even 100 tons register. Both on the east and south coast they were formerly all cutter-rigged; but this was when the maximum size did not exceed 50 tons. The larger vessels on the east coast are now ketch-rigged, carrying two masts each with gaff sails. On the south-west coast there are very few vessels over 50 tons. Most are cutter-rigged; though some have been converted to the other rig, which is much more economical in working, and safer in bad weather. The trawl is always carried along the rail or bulwarks on the port quarter, extending from the main rigging or a little behind it to the taffrail. When the trawl is 'shot,' it is towed from either the port or starboard quarter, according to the wind and tide. On the south coast the trawling rope is usually hauled in over the bows by a hand-winch, the after-bridle being finally wound in by a smaller winch aft. But on the east coast the boats are fitted with patent capstans by which the rope can be hauled in amidships, and these capstans are now almost always worked by steam.

On the east coast the greater number of trawlers belong to Hull, Grimsby, Yarmouth, Lowestoft, and Ramsgate. The grounds fished by these are chiefly the Dogger Bank in winter, and the banks off the Danish, German, and Dutch coasts in summer. In winter each smack usually carries ice and takes home her own fish; but in summer the vessels fish in fleets, and steam-carriers are employed which collect the fish and take it to London or the east coast ports. The principal trawling ports in the south-west are Brixham and Plymouth. The trawlers here fish not in a fleet, but independently

of one another. The autumn and winter fishing is carried on off the respective ports, but in spring and early summer nearly all the boats fish south of the Wolf Rock off Mount's Bay, or off the north coast of Cornwall, which grounds have also been visited in spring by a large number of North Sea boats. In many places steam-tugs combine trawling with their ordinary work, shooting their trawls when on the lookout for ships. This is the custom with the steam-tugs of Falmouth and Cardiff, the boats from the latter place fishing west of Lundy Island. There are a few trawlers at Tenby, and this kind of fishing is also carried on from Whitehaven, Fleetwood, Blackpool, Southport, and Liverpool, the trawling grounds on the north-west coast lying between the Isle of Man and the mainland, and off the Welsh coast.

There are no sailing trawlers of large size at any of the Scottish fishing ports; but some smaller boats with smaller trawls fish from St Andrews and one or two other places. Steam-trawling, however, is carried on both by tugs and by screw-steamers entirely devoted to the industry at Granton and Leith, and at Aberdeen. The grounds fished by the Firth of Forth boats extend from the outer part of the Firth to 30 or 40 miles east of the Isle of May, while the Aberdeen boats fish off the coast of Aberdeenshire and in the Moray Firth. The Firth of Forth, St Andrews Bay, and the territorial water from Kinnaird Head to the Ord of Caithness were in 1887 closed against trawling by the Scottish Fishery Board. In Ireland, Dublin is the centre of a large and important trawling fishery, and possesses a fleet of about 50 smacks, which are from 30 to 50 tons measurement, and cutter-rigged. These boats work between the Isle of Man and the Irish coast. Trawling is also carried on to some extent in Dingle and Galway bays, but not on an extensive scale. Most of the grounds mentioned as fished by trawlers are between 30 and 40 fathoms in depth. Occasionally trawling is carried on in deeper water, even up to 70 fathoms, but the labour of hauling in is then considerably increased. Trawling can only be carried on over ground which is fairly level and free from obstructions; over a rough, rocky bottom it is, of course, impossible to work a trawl. In fact, one of the principal expenses in this kind of fishing is the cost of new trawl-nets, beams, irons, and rope to replace those worn out or lost. Even without accidents the net soon wears out, and on the most favourable ground the trawl not uncommonly catches fast in a sunken wreck, an isolated rock, or a lost anchor, and is either lost or considerably damaged.

The principal fish caught in the trawl are all kinds of flat-fishes—viz. halibut, turbot, brill, soles, plaice, flounders, dabs, and other less familiar forms called by different names in different places, such as lemon soles or merry soles, megrims, witches; also skates and rays, which are bottom-fish of a flattened shape but of a different class; and all kinds of round-fish, or, as they are sometimes called, white fish, which feed to a great extent on the sea-bottom, such as cod, haddock, whiting, pouting, pollack, coal-fish, hake, ling; and also other miscellaneous species, as gurnards, red mullet, bass, sea-breams, dorys, and conger.

(2) *Hook and line fishing* is of two kinds—that carried on by hand-lines, and that by long lines. Long lines, again, vary in length and the size of the hooks, according to the fish sought. Thus, off the east coast of Scotland large-sized boats go long distances from land to 'shoot' lines of very great length with hooks of large size, and catch cod, ling, halibut, skates and rays, turbot and coal-fish (*Gadus carbonarius*). Smaller boats fish at shorter distances, with similar lines and smaller hooks, for

haddock. This latter fishery is regularly carried on all along the east coast of Scotland, and forms the principal occupation of the smaller boats. The lines are always baited with mussel, and the hooks are always baited on shore by the wives and children of the fishermen. The baiting is done in a very careful and skilful manner. Each man of a crew contributes a certain number of lines of his own; each line when ready to go to sea is coiled up in a separate basket, made of wickerwork and very shallow—a criel. All the hooks are laid in the centre of the coil, and as they are baited and placed in position fresh grass is scattered over them and among them, so that the bait remains moist until the line is shot. When the ground is reached the boat is allowed to sail (or in some cases steam) steadily and gently along. A heavy stone attached to one end of a line is thrown overboard first, and attached to this stone is another line, long enough to reach to the surface, and fastened at its upper end to a flagstaff, buoyed and weighted so as to float upright in the water. The line is then taken overboard from the boat as she moves along. To prevent the hooks catching in the rail of the boat the line is made to pass over a thick metal cylinder which one of the crew holds in his hand. Before the whole of a line is run out another is fastened (bent on) to its end, so that all the lines are joined together, and stretch for two miles or so along the bottom of the sea. The line is always shot across the tide—i.e. transverse to the direction in which the tide is flowing, so that the short lines which fasten the hooks to the main line, at intervals of one fathom, are kept extended perpendicular to the main line. When the last line is shot another buoyed flagstaff is attached to the end of it, and the whole is left at the bottom for half an hour to an hour. Then the flagstaff last thrown overboard is picked up again, and the line is hauled in in the opposite direction to that in which it was shot. An occasional plaice or gurnard is caught on these lines, but the majority of the fish taken are haddocks. Many of the baits are taken by starfishes, whelks, crabs, &c., and a large number of the hooks in certain localities bring up specimens of the hag-fish, or boier, which has no jaws, but takes the hook down into its stomach.

On the east coast of England the largest kinds of long lines are extensively used. They are worked by vessels of about the same size as deep-sea trawlers, but having a compartment of the hold to which the sea-water has access, and in which the cod, the principal fish caught, are kept alive. These lines are each usually about 7000 fathoms long altogether when shot, or about 8 ordinary miles, and carry 4680 hooks. The bait most used consists of whelks. The fishing is principally carried on in winter over the Dogger Bank and Cromer Knoll. The long lines used on the south coast, locally called 'butlers', are not so long, and are worked usually from smaller, generally open, boats. The bait mostly used is squid (*Loligo vulgaris*), which is obtained from the trawlers, and the principal fish caught are conger, cod, ling, hake, skates, and rays. Hand-lines are single lines with one or more hooks, of which one end is kept in the land, the hooks being drawn up and re-baited whenever a fish is caught. This kind of fishing is largely carried on on the east coast for cod, and on the south coast with smaller hooks for whiting. It is carried on always at a short distance from the land.

Thus a great many fish are caught in almost equal numbers by hook and by the trawl; but each kind of instrument has its limitations. Soles, for instance, are scarcely ever caught by the hook, though turbot, brill, and halibut are; the conger, on the other hand, is only occasionally taken in the

trawl. Long lines can be shot on any kind of ground, and rough, rocky ground, where the trawl cannot be worked, is usually the most productive for long-line fishing. All the fishes caught by these methods are predaceous forms, with large mouths, which feed either on the invertebrata of the sea-bottom, or on the migratory fish which swim in shoals, such as the herring and pilchard. The trawl can only catch those which are feeding on smooth ground, while the baited hook secures them on rough ground and in mid-water.

(3) *Drift-nets* are oblong nets fastened together in a long series, buoyed above so as to float vertically in the sea. The series of nets, or 'fleet,' as it is called, is fastened at one end by a rope to the boat from which it is worked, and nets and boat 'drift' or 'drive' with the tide. The nets are shot at right angles to the current of the tide, and those fish which swim in shoals in the upper waters of the sea strike against them in their course, or when carried along by the tide; and, their heads passing through the meshes, the fish can neither swim forwards, because their bodies are too large to pass through the meshes, nor backwards, because their gill-covers are then caught by the string of the net. These nets are used to capture herring, mackerel, and pilchard. The herring-fishery is principally pursued on the east coast of Great Britain, especially on the east coast of Scotland; the mackerel is most abundant on the south coast of England and Ireland, while the pilchard is almost entirely confined to the south-west coast of England. The nets as used for herrings and pilchards only differ in the size of the mesh. For herrings the mesh is about  $1\frac{1}{2}$  inch square, or 20 to 32 meshes to the yard. The nets are supported by a rope along the upper edge, and when shot are connected by tying the ends of these ropes together, and along this rope pieces of cork are attached to keep it uppermost. To the same rope, at each end of each net, are attached bladders of considerable size by means of a few fathoms of strong line. As these buoys float on the surface of the water, the nets are suspended below at a distance depending on the length of the buoy-lines, and varying according to the depth at which the fish are expected to occur. For pilchards the nets have a mesh of 36 to 38 to the yard.

Mackerel-nets have a larger mesh—viz. only 25 or 26 meshes to the yard, and also are worked differently. The 'back' of the nets is kept at the surface of the sea, floats being fastened directly on to it, and a separate rope, called the 'foot-line,' is connected to the 'back' of each net by a long connecting-line. The foot-line therefore sinks to some distance below the bottom of the nets. The reason for this is that mackerel usually swim quite near to the surface of the water, and, as the line running along the 'back' of the nets, being kept at the surface, is liable to be broken by passing vessels, it is necessary that the nets should be attached to the foot-rope, which sinks to a safe distance, and by which the nets are hauled in.

Drift-nets in Scotland and in the south-west of England are worked from lugger-rigged boats, fitted with foremast and mizzen. The foremast is the larger, and is lowered when the nets are all shot. The mast is stepped in a kind of socket, to admit of its being lowered. When a boat is 'riding to her nets,' if there is any wind, even when the sails are lowered, a considerable strain is put upon the rope by which she is fastened to the nets. The latter, being in the water, are not affected by the wind. It is to reduce this strain and obviate the danger of breaking the rope that it is necessary to lower the mast. On the east coast of England luggers are chiefly used for the herring-fishery; but for mackerel-fishing large boats, often clinker-built,

fitted with two masts, fore and aft rigged, are mostly employed.

(4) The *seine* is a single, continuous net, attached to a cork-line above and a leaded line below, and attached at each end by means of these lines to a long rope. In Britain the seine is always worked from the shore. It is shot from a rowing-boat in a large semicircle, and then by means of the two end ropes is hauled on shore, or the ends are brought together so as to inclose the fish. For catching pilchards on the coast of Cornwall very large seines are used, about 200 fathoms long and 10 fathoms deep at the deepest part. These nets are too large to be drawn on to the shore when they inclose a large number of fish; the ends are therefore brought together close to the shore and moored, and smaller seines are shot within the larger net to take out the fish as they are required. This kind of fishing is principally pursued at St Ives. Smaller seines, called ground-seines, are used on the south coast for catching sprats and gray mullet, and are mostly worked in estuaries. The net used in England, Wales, and Ireland for catching salmon and sea-trout in public waters is a kind of seine, and is worked by a boat called a coble.

(5) *Moored-nets* are of various kinds. Herring-nets, similar to those used in drifting, are moored in some places across the tide, the fish caught being taken out by means of boats every morning. A kind of moored beam-trawl, called a stow-net or bag-net, is used in estuaries—e.g. in the upper parts of the Firth of Forth; the flowing or ebbing tide carries fish of various kinds into its mouth. The mouth of the net is attached by means of bridles to the same anchor which moors the boat from which the net is worked.

(6) *Crabs* and *lobsters* are taken in traps, which are usually dome-shaped cages made of wickerwork or netting stretched on a frame. Openings, in the form of funnels projecting into the interior of the trap, are situated either at its top or sides. The trap is baited with pieces of fish, and sunk by means of heavy stones attached to its bottom. These traps are called crab or lobster pots, and usually several of them are put down in a series attached to one another. Their position is marked by cork floats connected to the pots by a line long enough to reach to the surface, and by this line the pots are recovered.

(7) The *oyster-dredge* is like a small trawl, but the mouth is made by a rectangle of iron bands, and the net is usually made of iron rings linked together.

Next in importance after the sea-fisheries in the United Kingdom is the salmon-fishery, which is subject to a number of legal restrictions; for, while the fish in the sea are not private property until captured, the salmon in fresh water is nowhere in the United Kingdom considered as public property. In England and in Ireland, in common law, the salmon in rivers which are not navigable belong to the riparian owner, while every one has a right to fish in the tidal part of navigable rivers and in the sea. But in Scotland all the salmon-fishings in the country, not only in rivers but also in estuaries and on the sea-shore, to one mile beyond low-water mark, belong to the crown, or the grantees of the crown. It is an historical consequence of this difference that salmon and sea-trout are taken in English and Irish public waters—i.e. on the coast and in estuaries—by net and coble, while in private waters they are usually taken by rod and line. There are some 'fixed engines,' which, having been in existence for some time, have not been made illegal, but no new cruives or stake-nets are allowed by law. In Scotland stake-nets are the usual means of capture on the coast and in estuaries, and there are several cruives on the unnavigable rivers.

The whale-fisheries of the Arctic Ocean are not so important as they were at one time, the invention of gas and the discovery of other lubricants having rendered us independent of whale-oil. The success of the whale-fisheries has also fluctuated so much as to prevent modern capitalists from embarking very largely in the trade. The only novelties that distinguish the whale-fishery of the present day are the introduction of steam-whalers, and, in some instances, the practice of vessels wintering in Greenland; but, even with these advantages, British whalers barely pay their expenses, and the fishery, as compared with former years, exhibits a considerable falling-off. The total whaling fleet numbered at one time 159 ships, but to-day it barely amounts to a tenth of that number. The seal is now largely captured for the purpose of obtaining its oil; many thousands annually are killed by British sealers, as many as 15,000 being taken by the men of a single ship. Norway also fits out a number of steamers for the Arctic seal and whale fisheries. See WHALE, SEAL, GREENLAND, &c. The South Sea or sperm-whale fishery is principally in the hands of the Americans, who pursue this branch of commerce most successfully.

The other European countries bordering the North Sea and the Channel practise all the various methods of fishing pursued by British boats, and occasionally a certain amount of jealousy and friction arises between the men of different nationalities. Of extensive fisheries off the coast of Norway the most important are the cod-fishery of the Loffoden Islands (which is carried on both by hand-lines and by gill-nets like our drift-nets), and the herring drift-net fishery. Lobsters and mackerel are also taken by the Norwegians in considerable numbers, but their coasts are not adapted for trawling. The sardine-fishery, carried on by seines, occupies a large number of people on the south and west coasts of France, as well as on the west coast of Italy. See also TUNNY.

France and Holland both possess oyster-fisheries which are far more productive than those of Great Britain, and this is due in great measure to the science and care with which the oysters are cultivated. The principal seats of this industry in France are at the bays of Arcachon and Concarneau; in Holland, at the mouth of the Scheldt. See OYSTER.

In other parts of the world the largest fisheries are those of Canada and the United States. In the latter there is a very important seine-fishery for the shad, a species different from the European shad, which ascends the Hudson, Delaware, and Chesapeake in order to spawn. Soles and turbot do not exist on the American side of the Atlantic; but black-fish, weak-fish, blue-fish, porgies, the herring, the common mackerel, and another species, the Spanish mackerel, are very largely fished. There is also another valuable clupeoid, called the menhaden, much larger than the herring. The mackerel is captured by means of large seines worked out at sea from a large boat. The vessels engaged in this fishery are schooners of 60 to 80 tons, and the seine boat is launched from the vessel when a school of fish is sighted. A large number of mackerel are also taken in drift-nets, similar to those of Europe. The Newfoundland cod-fishery is extremely productive, and is prosecuted both by hook and line, and by seines worked at sea; on the Grand Banks the fishermen are mostly French, the inhabitants of Newfoundland, as of Canada generally, carrying on the more convenient and less risky inshore fishery. Both Canada and the United States possess valuable oyster-fisheries, and the oyster 'farms' of New York state—notably, since 1888, along the floor of Long Island Sound—are especially extensive; but

the European oyster does not occur in America. See OYSTER.

The most important fishery on the Pacific coast is that for the Pacific salmon, large quantities of which are preserved in tins for export to Europe. On the Atlantic side, also, the rivers of Maine and farther north abound in salmon. For the American seal-fishery, see ALASKA.

The Canadian fisheries dispute dates from the close of the war of 1812. Under the treaty of 1783, at the close of the war of independence, the fishing-banks, coasts, bays, and creeks of Canada had been thrown open to United States fishermen; but the British commissioners in 1814 held that the second war had destroyed the earlier treaty, whereas the American representatives claimed that the rights guaranteed by the treaty were inalienable and irrevocable. The matter was left open, no reference to the fisheries appearing in the treaty of Ghent. An attempt to settle the dispute in 1818, by granting to Americans the right to fish outside the limit of three marine miles from the Canadian coast, failed to allay the controversy, which was now embittered by the 'headland question' and others, involving the right of Americans to fish in the Gulf of St Lawrence, the Bay of Fundy, and the Bay of Chaleurs. Following on the seizure of the *Washington*, this dispute, so far as it related to the Bay of Fundy, was submitted to arbitration, and decided in favour of the United States. Except during the years 1854-66, when a reciprocity treaty was in vogue, matters remained unsettled until 1871, when by the treaty of Washington the fisheries of both countries were thrown open reciprocally. Britain, however, asserted that, the privilege of fishing in American waters being practically worthless, she accorded more than she received; and from a commission organised nearly six years later she claimed an award of \$14,280,000 for the use of the Newfoundland and inshore fisheries for twelve years—the period of treaty. The sum awarded was \$5,500,000. For the further history of the dispute, see CANADA.

Within the last century a great many legislative enactments concerning the fisheries have been passed in the United Kingdom. Legislation concerning the salmon-fisheries has a different character from that applied to the sea-fisheries. The former consists in restrictions upon the rights of private property in salmon, or upon the public right of fishing, enforced for the sake of preventing the diminution of the natural supply of the fish. The latter, up to the present time, consists chiefly in regulations of navigation and marine police, the object of which is to maintain order and justice among different classes of fishermen, and to prevent fishing-vessels endangering the safety of one another, or of other vessels, at sea. For the laws in force for salmon-fisheries, see SALMON.

By the Sea-fisheries Acts of 1868 and 1883, and the conventions between Britain and other European countries, the right of fishing within three miles of the coast of any country is exclusively reserved to the subjects of that country. All regulations concerning the size of the mesh of net or the character of fishing apparatus are now abolished. All British sea-fishing boats must be numbered and registered, and the enforcement of this regulation is intrusted to the customs officers, who are assisted by the coastguard, each boat carrying letters showing the customs district to which it belongs. Stringent regulations are enforced as to the lights to be carried by fishing-boats, and the protection of drift-nets and lines from injury by trawlers. No trawler is allowed to shoot his trawl within three miles of any boat which has drift-nets in the water.

It is only within the last few years that steps

have been taken to organise the administration of the powers of the government over the fisheries of the United Kingdom in such a way as to provide the public annually with statistical and comparative information of a complete and systematic kind upon these industries. This is especially true with respect to England and Wales. Up till the year 1886 jurisdiction over the fisheries of these countries was vested partly in the Home Office and partly in the Board of Trade. The former department included two fishery inspectors, who made an annual report on the salmon and fresh-water fisheries, but did not regularly report on the marine fisheries. In 1886 this jurisdiction was transferred to the Board of Trade, a sub-department being organised under that board to transact fisheries business. Since then there have been three inspectors—two for fresh-water, and one for marine fisheries. These issue two separate annual reports, addressed to the secretary of the Board of Trade; and in the year 1888 the Twenty-seventh Annual Report on Salmon and Fresh-water Fisheries and the Second Annual Report on Sea-fisheries were published. The Board of Trade also publishes monthly returns, and an annual abstract of the quantity and value of fish landed on all the coasts of the United Kingdom. These statistics are collected in England and Wales by the officers of the coastguard, by direction of the Fisheries Sub-department, while the statistics of Scotland and Ireland are furnished to the Board of Trade by the Scottish Fishery Board and the inspectors of Irish Fisheries respectively. Complete returns were obtained for the first time for England and Wales at the end of 1886; for Scotland at the end of 1887; for Ireland at the end of 1888. In Ireland the returns are collected, as in England, by the coastguard; in Scotland by the local officers of the Fishery Board.

Jurisdiction over the Scottish fisheries is vested in the Fishery Board for Scotland, whose offices are in Edinburgh. This board makes an annual report to the government of the United Kingdom, addressed to Her Majesty's Secretary for Scotland for the time being. The board, as at present constituted, was established by act of parliament in 1882; before that time a board existed which regulated the inspection and branding of cured herrings, but the present board was instituted with revised and extended powers. For the purposes of administration the coasts of Scotland are divided into districts, each of which has one or more fishery officers. The number of these districts is twenty-six—seventeen on the east coast, and nine on the west. It must be borne in mind that the elaborate and thorough character of this administrative organisation in Scotland has been developed in consequence of the peculiarities of the Scottish herring trade. The supply of herrings on the coasts of Scotland, especially on the east coast, is enormous, and the demand for these herrings as food has always been very large, and has increased with the increase of population in Europe. Fresh herrings, of course, cannot be exported abroad in very large quantities, but they are acceptable and cheap food when salted, and great quantities are annually exported in this condition to Denmark, Germany, Russia, and Scandinavia, where they form a regular part of the diet of the mass of the people, especially in winter.

To encourage the industry of herring-curing the British government from 1809 to 1826 paid a bounty of 4s. on each barrel properly cured. The original Scottish Fishery Board was instituted principally to organise the official inspection of the cured herrings, and its officers branded every barrel whose contents came up to the required standard, and

on which therefore the bounty could be claimed. Between 1826 and 1830 the bounty was gradually reduced, and finally abolished. But the brand still continued in demand among the foreign buyers, and the Scottish curers therefore continued to apply for it. Thus it came about that in 1839 a fee was demanded by the Fishery Board for the same brand which originally conveyed the right to a bounty. The branding is not in the least compulsory, and some curers rely on their own trademark as a sufficient guarantee of quality. But a large proportion of the curers are willing to pay the fee charged for the official brand, which is now 4d. a barrel. In 1886 the income received from these fees by the board was £8649; in 1887, £8166. Thus the board is provided at once with an income and an organisation which naturally come to be employed in collecting information of all kinds concerning all the sea-fisheries, and in fostering and developing the whole industry.

The board also exercises a superintendence of the fisheries, and maintains order at sea by means of a number of vessels which are now manned and managed by the admiral-superintendent of Naval Reserves, but whose movements are directed by the board. Two of these vessels, a screw-steamer and a sailing schooner, are permanently in the service of the board, but in the herring season additional tenders and cutters are commissioned to assist in the work.

In Ireland the superintendence of the fisheries is entrusted to three inspectors, who constitute the Fisheries Department of the government offices at Dublin Castle. These officials act together as a body, and have jurisdiction over both sea and inland fisheries, upon which they make a single joint report annually to the lord-lieutenant of Ireland.

According to the annual returns of the Board of Trade, published under the title 'Statistical Tables and Memorandum relating to the Sea-fisheries of the United Kingdom,' &c., the total value of the fish landed on the coasts of the United Kingdom in 1888 was £6,418,000, made up as follows:

|                                  |            |
|----------------------------------|------------|
| England and Wales.....           | £4,213,000 |
| Scotland (excluding salmon)..... | 1,411,000  |
| Ireland (excluding salmon).....  | 191,000    |

The value of the salmon of Scotland and Ireland for 1888 was still uncalculated, but in 1887 was:

|               |          |
|---------------|----------|
| Scotland..... | £283,000 |
| Ireland.....  | 320,000  |

and it is assumed that the totals for 1888 did not very greatly differ from these. The total weight of the fish thus valued, exclusive of shell-fish, was:

|                                  |               |
|----------------------------------|---------------|
| England and Wales.....           | 317,000 tons. |
| Scotland (excluding salmon)..... | 238,000 "     |
| Ireland (excluding salmon).....  | 20,000 "      |

The returns give no statistics of the number of men or vessels employed in the fisheries of the United Kingdom, though they furnish these particulars concerning those of some other countries. But we find in the Scottish Fishery Board Report for 1887 that the number of persons employed in fishing that year in Scotland was 50,023. The number of fishermen and boys in 1887 in England is given in the Report of the Inspector of Sea-fisheries as 47,341. The Irish report for the same year states the number of persons totally or partially engaged in fishing at 21,750, of whom only 6387 were exclusively occupied in the fisheries. If we take the larger number for Ireland and add the totals of the three countries together, the total number of fishermen and boys for the United Kingdom amounts to 119,114. The total number of boats employed in England and Wales is not given. The Scottish Fishery Board gives the number of boats and trawlers belonging to Scotland in 1887 as 15,135,

to which are to be added 102 vessels fitted out for long fishing voyages. The total tonnage was 132,837. According to the Irish report, the total number of boats employed in Ireland in the same year was 5865.

The herring-fishery is by far the most productive and valuable of all the sea-fisheries of Scotland. The largest herring-fishing on the Scottish coasts ever known was in 1884, when 1,697,077 barrels were cured. The number cured in 1887 was 1,303,424, valued at £1,042,739. This is, of course, very different from the value on landing.

In the statistical tables of the Board of Trade the following statistics of foreign countries are given:

|                    | Vessels. | Men.    | Value of Fisheries. |
|--------------------|----------|---------|---------------------|
| Norway (1887)..... | 31,630   | 123,843 | £820,000*           |
| France (1886)..... | 23,850   | 135,478 | 3,361,000           |
| Canada (1887)..... | 20,200†  | 50,983  | 3,890,438           |

The United States do not publish an annual estimate, but the figures for 1880 given in the compendium of the tenth census are: Fishermen, 131,426; vessels, 6605; boats, 44,804; value of products, £8,609,210.

In the Board of Trade returns it is stated that the sea-fisheries of the United Kingdom appear to be of greater value than those of any other country which publishes tolerably complete records, and probably are of greater value than those of any other country in the world. And this in spite of the fact that the yield of the sea-fisheries of the United States in 1880 is stated to be worth more than eight million pounds. The explanation of this is that the United States figures include more than the mere landing values, and that an exact comparison of British with American fisheries cannot yet be made. If we compare the number of fishermen to the total population, we find that the proportion in Scotland is about one in 76; in England and Wales, one in 612; in Ireland, one in 216; in the United States, one in 381; in Norway, one in 16; in France, one in 278.

Fisheries exhibitions like that at London in 1883 have been held in various places with much success. On fisheries, see articles PISCICULTURE, ANGLING, COD, HERRING, &c.; also E. W. H. Holdsworth, *Deep-sea Fishing and Fishing Boats* (1874); the English, Scottish, and Irish Reports; the *Journal of the Marine Biological Association* (begun in 1887); and the Annual Bulletin of the United States Fish Commission. These last contain comprehensive articles on the fisheries of all parts of the world.

**Fisher's Hill**, in the Shenandoah valley, Virginia, 30 miles S. of Winchester, memorable for Sheridan's victory over the Confederate General Early, on 21st September 1864.

**Fishes**, a great class of backboned animals, rising above the lowly vertebrates—Ascidians, lancelet, and round mouths—on the one hand, and leading on to the Amphibians on the other. The Tunicates or Ascidians (q.v.) are indeed numerous, but they are mostly degenerate; the level attained by the lancelet (*Amphioxus*, q.v.) is represented only by a single genus; the round mouths or Cyclostomata (q.v.) are few in number and partially retrogressive, but the fishes have been and are successful. In the possession of the characteristic vertebrate axis and central nervous system, in general compactness and co-ordination of structure, in their external armature of scales, and in their great fecundity, fishes have an easy pre-eminence over their invertebrate inferiors, while as successfully adapted forms they hold as firm possession of their own special medium as birds do of theirs. Their success may be read in the immense number of individuals, species, and

\* The value, however, for each year from 1874 to 1886 is given as over £1,000,000.

† Of which only 1108 were vessels, the rest boats.

genera, not only now, but in the great aeons of the past; in the geological record which shows how the Cartilaginous Fishes (q.v.) or shark tribe have persisted strongly from Silurian times, or how the decadent Ganoid (e.g. sturgeon) order is followed by a yet richer predominance of the modern Bony Fishes (q.v.); and, furthermore, in the wealth of adaptive specialisation which distinguishes so many, and which in the case of the 'double-breathers' or Dipnoi prophesies, in the evolution of lungs, the important transition from water to *terra firma*.

**Literary History.**—The history of the study of fishes finds its beginning as usual in the work of Aristotle (384–322 B.C.), who distinguished over a hundred Aegean species, is perfectly clear in discriminating them from cetaceans and invertebrates, and records a surprising amount of information in regard to both their structure and habits. As with other departments of natural history, so ichthyology, in spite of its stable foundation, remained virtually unprogressive for eighteen centuries. In the 16th century at length Belon began to collect both specimens and information; Salviani, the physician of three popes, published an illustrated work characterised rather by artistic merit and popular interest than by scientific value; while Rondelet, as a medical anatomist, ventured further into structural details than either of his contemporaries. In the next century the classifying genius of Ray and Willughby achieved great progress, and the establishment of order was continued by Artedi, whose results were edited by his fellow-student Linnaeus. The labours of the Linnaean school were ably continued by Bloch and Lacépède, both working during the critical period of the French Revolution. The anatomical investigations of Alexander Mourou, embodied in a classical folio, led on to the great *Histoire Naturelle des Poissons* begun by Cuvier, continued by his pupil and collaborateur Valenciennes, and finally left unfinished in 1845 at the twenty-second volume. The virtual discovery of the Ganoids by Agassiz, their investigation by Johannes Müller, the separation of the Dipnoi, the Cyclostomata, and Amphioxus by the same anatomist, and the discovery of *Ceratodus*, described in 1871 by Günther, were ichthyological events of great importance. Within late years, apart from the vigorous prosecution of anatomical investigation, the study of the development of fishes has yielded to such workers as Balfour, Parker, and Semper results of fundamental import; our knowledge of fossil forms is being continually enriched by the researches of Traquair and others; the theoretical aspects of structure have been especially investigated by Dohrn; while the high-water mark of general ichthyology is represented in the British Museum Catalogue of Fishes and other works by Günther.

**General Survey.**—After excluding the lancelet and the round mouths as survivors of far-removed ancestral forms, there remain four great orders of fishes properly so called—the Cartilaginous Fishes, the Ganoids, the Dipnoi, and the Bony Fishes or Teleosteans. The first three orders, of more ancient origin, are distinguished as Palaeichthyes from the modern fishes or Teleostei which now form the vast majority. The cartilaginous fishes include the Elasmobranchii—skates and rays, sharks and dog-fish, with the addition of an unimportant sub-order, Holocephali, for the king of the herrings (*Chimaera*) and the genus *Callorhynchus*. The Ganoids or heavily-armoured fishes had their golden age in Devonian and Carboniferous times, and are represented nowadays only by a few genera—e.g. sturgeon (*Acipenser*), bony pike (*Lepidosteus*), Polypterus, and *Amia*; while the Dipnoi or double-breathers have only three representative genera,

widely separated in geographical distribution—*Ceratodus* from Queensland, *Protopterus* from West and tropical Africa, and *Lepidosiren* from the Amazon. The Teleostean fishes include all the most familiar fresh-water and marine forms.

**General Characters.**—Like other vertebrates, fishes possess a segmented body, well indicated by the disposition of the muscles; a dorsal nerve cord, swollen anteriorly into a brain; a dorsal axis or notochord, more or less completely replaced by a genuine backbone; a set of respiratory clefts on the pharynx, which here persist and are associated with gills; a ventral heart; and eyes which arise for the most part as outgrowths of the brain. But their prominent peculiarities are associated with the three sets of structures—scales, fins, and gills. The scales are prothets of both outer and inner skin—i.e. of both epidermis and dermis; the unpaired median fins are always supported by skeletal rays, and the paired lateral fins or limbs are never in any definite sense fingered; the gills are retained throughout life, and except in the Dipnoi there are only the beginnings of pulmonary respiration. Technical negative characters are the absence of an allantoic bladder and of a true inferior vena cava.

**Structure and Functions.**—The most characteristic form is that of herring, haddock, salmon, and the like, an elongated, laterally-compressed spindle, thinning off like a wedge posteriorly, and obviously the result of, or an adaptation to, the mode of aquatic progression. But the skates are flattened from above downwards, and the bony flat-fish, such as plaice, are compressed laterally; the eels, the ribbon-fish (e.g. *Regalecus*), the band-fish (*Cepola*), the pipe-fish (*Syngnathus*), are much elongated; while the globe-fish (*Tetraodon*, *Diodon*), collar-fish (*Ostracion*), and sun-fish (*Orthogoriscus*) are more or less globular. The flat-fish live at the bottom; the elongated forms have a serpentine habit of creeping through crevices; the globular forms are sluggish, and may float apparently passive in the water. Prominent external characters, to be presently noticed in order, are the nostrils and eyes, the openings of the gill-cavities, the various kinds of scales, the paired and the median fins, the lateral sensory lines, the openings of the gut and urinogenital organs, the symmetrical or asymmetrical shape of the tail.

The skin has no true glands; the under stratum or cutis is without muscular elements; both layers take part in forming the exoskeleton of scales. In some bony fishes, in the Dipnoi, and in the sturgeon, goblet-like mucous cells burst and produce a slimy surface, but the usual slime so noticeable in skates and many other fishes exudes from special sensory tubules. Pigment cells under nervous control are common in the skin—e.g. in plaice, which thereby more or less rapidly alter their colour to suit their surroundings. The colours of fishes are often resplendent, and usually depend on the presence of lipochromo or fatty pigments, greatly enhanced by structural peculiarities and by the presence of a silvery foreground of granin in the epidermic cells (see PIGMENT). As in the 'gemmeous dragonet,' the males are at the breeding season often transfigured in brilliant 'wedding' robes. The exoskeleton varies very widely, and so inconspicuously that Agassiz' attempt to base a classification on the nature of the scales has been universally abandoned. Cartilaginous fishes are characterised by large or small skin-teeth, 'dermal denticles' or 'placoid scales,' forming the spines of a thornback or the shagreen of a shark. They are based in bone, cored with dentine, tipped with enamel, and are similar in structure and development to the true teeth of the mouth. The bone and dentine are formed from the cutis or dermis, the enamel from the epidermis. Skin-teeth occur here and there in other fishes, but

flat scales predominate. These lie in sacks of the under skin, sometimes fuse together into plates, are covered with enamel in the bony pike and some other Ganoids, but are best known as soft overlapping plates in the common Teleosteans, where they are called cycloid or ctenoid, according as the free margin is entire or toothed.

*Skeleton.*—The oldest vertebrate skeletons were cartilaginous, and the greater part of every individual framework has to recapitulate this stage. Very early, however, and at first in scales and teeth, bone was developed; but many of the older types of fishes are only slightly or very partially beyond the cartilaginous level. This is true of Elasmobranchs, Dipnoi, and some Ganoids, while other Ganoids and the bony fishes *par excellence*—the Teleosteans—have ossified skeletons. As in all other vertebrates,

Fig. 1.—Skeleton of the Perch (after Gunther).

the longitudinal axis begins as a rod of cells on the dorsal wall of the gut. This notochord, itself of endodermic origin, becomes surrounded by a mesodermic sheath, and when a genuine vertebral column is established it is always by the predominance of the sheath over the enclosed rod. In some Elasmobranchs, in gristly Ganoids, such as the sturgeon, and in Dipnoi, the notochord with its sheath persists undivided; while in other fishes vertebral bodies, bony or otherwise, are established. The typical fish vertebra is concave at both ends, and every two adjacent vertebrae thus enclose a wide space in which the remains of the notochord persist. The bony pike (*Lepidostens*), one of the bony Ganoids, stands alone in having vertebrae hollow behind but convex in front. The dorsal axis protects the spinal cord, which lies above, by forming a continuous tunnel, or by a succession of 'neural arches.' In the tail region 'haemal processes' similarly surround the blood-vessels, and the external ends of neural and haemal arches may come to be associated with dorsal and anal unpaired fins. The tail-end of the axis is usually bent upwards, but is straight in Dipnoi and a few others, and is surrounded by a special bony sheath in many Teleosteans. Thus, we have an asymmetrical tail in Elasmobranchs and some Ganoids, a perfectly symmetrical tail in Dipnoi, and a superficially symmetrical tail in most Teleosteans, and in some Ganoids, where the way in which the rays are disposed disguises the real upturning of the axis. When the notochord remains undivided the ribs are cartilaginous, and in all fishes they are very simple.

To understand the skull it is necessary to recognise its triple origin: (1) The brain is at first enclosed in a cartilaginous box, with which the gristly capsules surrounding nose and ear become at an early stage intimately associated. This chondrocranium or gristly brain-box is a truly axial portion of the skull, corresponding to a comparatively large number of segments (see SKULL). It is always well developed, and remains entirely unossified in Elasmobranchs alone, being in other fishes more or less modified into bones. (2) But, in the second

place, what are called skin bones have to be taken into account. These dermal ossifications, 'membrane,' or better 'investing-bones,' probably had their historic origin in the fusion of bony scales. They are greatly developed in bony Ganoids and in Teleosteans, and more or less cover the chondrocranium on its roof, floor, and sides. (3) Lastly, there depend from the skull a series of arches, of which the posterior form supports for the gills, while the anterior form at least the groundwork of the jaws, and may enter into yet more intimate union with the main body of the skull.

*Limbs.*—The paired fins of fishes are in origin strictly comparable with the arms and legs of higher vertebrates, but their component parts are too simple to be very definitely compared with those of fingered or toed appendages, such as occur for the first time in amphibians. A typical fin consists of a basal piece, or of several, associated internally with a pectoral, and less constantly with a pelvic girdle. From the base a large number of rays radiate outwards. A most interesting type, from which some have attempted directly to derive the 'dactyls' of higher forms, is exhibited by the Dipnoi, in which a main axis runs down the limb (see CERATODUS). It seems most probable that the paired fins are concentrations or remnants of a continuous lateral fin extending along each side of the body, or of a series of limbs, one for each segment. Among the modifications worth noting are the enormous pectoral fins of skates, the anterior position of the pelvic fins in many bony fishes, and the entire absence of limbs in eels, pipe-fish, and a few other Teleosteans. As to their use, it must be remembered that the chief organ of locomotion is the tail, and that the paired fins serve to raise and depress the fish in the water, or to some extent as rudders. In a few cases, as in the climbing perch, they are utilised as scrambling appendages. The pectoral girdle which supports the fore-limb is cartilaginous in Elasmobranchs, Dipnoi, and some Ganoids, but is elsewhere ossified. Coracoid and scapular portions are distinguishable, while in Ganoids and Teleosteans there is a special development of investing bones. The pelvic girdle is a well-developed hoop in Elasmobranchs, while in Ganoids and Teleosteans, with one or two trifling exceptions, it is absent. The unpaired fins are derived from a continuous fringe seen in

Fig. 2.—The Origin of Fins:

A, showing the undifferentiated embryonic and probably primitive state, with continuous median and lateral fins. B, showing the two dorsals, the caudal and anal unpaired fins, and the pectoral and pelvic paired fins. (After Wiedersheim and Parker.)

the embryo (see fig. 2), and this state occasionally persists. Usually, however, there are several dorsals and anals, and the great locomotor fin of the tail. The rays are bony, cartilaginous, or bony, and vary enormously in size, form, and number. Sometimes spine-like and all of one

piece, sometimes soft and jointed, they afford valuable aids in classification.

**Muscular System.**—The great muscles of the trunk and tail, which do the work of locomotion, retain a segmented arrangement (as can be very plainly seen even on a boiled fish); and the segments or myotomes are separated by septa of fibrous connective tissue. Very remarkable modifications of muscular tissue form the various electric organs. See ELECTRIC FISHES.

**Nervous System.**—The brain and spinal cord are smaller in relation to the body than in other vertebrates. The growing skull outruns what it encloses, and the adult brain thus lies in a relatively large cranial cavity. All the usual divisions of the brain are developed, and in adult life lie virtually in one plane. Ten nerves from the brain, a large number from the spinal cord, and a sympathetic system exhibit their usual relations. See BRAIN, NERVE.

**Sense Organs.**—In most fishes a diffuse sensory system is located in the skin. Nerve endings of various kinds occur here and there over the surface, projecting superficially, arranged in definite lines, lodged in pits, or associated with a peculiar system of canals filled with mucus. The sensory structures thus variously arranged are distinguished as 'nerve eminences' and as 'end buds.' The former are very familiar in the lateral lines, one of which runs down each side of most bony fishes, and in the mucous canals which branch so abundantly on skates. The 'end buds' hardly occur in Elasmobranchs, but are abundant in Teleosts, especially about the head. Near the mouth of the sturgeon, the cod, and other forms are tactile 'barbules.' Important too, though unfamiliar, are the 'eye-like,' 'pearl-like,' and 'phosphorescent' organs on the skin of deep-sea fishes.

The nose sacs lie ventrally in Elasmobranchs, in some of which—e.g. skates—they are connected with the corners of the mouth in a sort of hare-lip fashion. In Ganoids and Teleosts the nasal sacs lie dorsally in front of the eyes, while the Dipnoi are alone among fishes in having posterior nasal apertures opening within the mouth, as in higher vertebrates.

The eyes (see EYE) are usually large, but are destitute of glands, and have but a slight development of lids. In fishes living in darkness, whether in caves, mud, or the deep sea, the eyes may be rudimentary (see BLIND FISH). The final position of both eyes on one side is a remarkable peculiarity of bony Flat-fishes (q.v.).

The ear, which is not very deeply buried, is surrounded by a cartilaginous capsule in Elasmobranchs and Dipnoi; but in other cases, whether the surroundings be gristly or bony, the wall next the skull is membranous. As in higher forms, the ear begins as an inturning of the skin, and a canal opening to the exterior in many Elasmobranchs persists as a remnant of this. From the comparatively superficial position of the ear, the waves of sound have not to penetrate so deeply as in higher vertebrates, and 'are conducted partly through the gill-cover (when present), and partly through the gill-slits or spiracle;' while in the skate there is what physiologically corresponds to a kind of drum. Inside the ear are the usual otolithic accumulations, sometimes soft, sometimes stone-like. In many Teleosts, as may be conveniently seen in cod or haddock, one of the otoliths is strikingly large.

**Intelligence and Emotions.**—Fishes are not usually credited with many emotions or with much intelligence, but their natural life has not yet been sufficiently studied to admit of a fair verdict. As it is, anglers know how they become wary and cunning, and keepers of aquaria have recorded

many instances of the commoner emotions and of fair intelligence. According to Romanes their emotions approach those of ants or of children four months old, except that no evidence of genuine sympathy is forthcoming. 'Fear and pugnacity are too apparent in fish to require special proof.' The social or gregarious feelings are strongly shown by the numberless species which swim in shoals, the sexual feelings are proved by courtships, and the parental by those species which build nests and guard their young. The stickleback woos his mate with undisguised passion and amusing coquetry, and guards the nest and eggs with jealous care. The Chinese butterfly-fish or Macropod, besides making an ingenious frothy nest of air and mucus, lifts the eggs into it by enveloping them in a cloud of bubbles. Tamed fishes have been known to become familiar with their keepers, and to answer to certain sounds. In natural life, the angling of the fishing-frog, the spitting of the archer-fish, the leaping of salmon and their careful selection of spawning grounds, the memory for localities which some are said to exhibit, all indicate that intelligence is not asleep in the fish's brain.

**Alimentary System and Food.**—The gut of fishes exhibits the usual vertebrate characteristics; but the distinctions of the several regions are often less marked than in higher forms. The mouth has no salivary glands, but, except in sturgeons, some Lophobranchs, and a few more, it has well-developed teeth on various bones. These mainly consist of ivory or dentine, tipped with enamel, and vary greatly in size, form, and mode of attachment. In cartilaginous fishes they rise out of a fibrous membrane which grows over the jaw as the outer teeth are worn away; in the angler (*Lophius*) and some other Teleosts they bend backwards, and oppose the egress of struggling prey; in bony Ganoids and in Teleostei they occur on branchial arches (pharyngeal teeth), as well as on the usual bones of the skull. The mouth is ventral in Elasmobranchs, but in other cases is terminal, or occasionally upturned. The pharynx opens to the exterior by the respiratory gill-slits; gullet, stomach, intestine, liver, and gall-bladder have

Fig. 3.—Internal Anatomy of the Carp, showing the muscle segments where the skin has been removed:

a, gills; b, heart; c, liver; d, swim-bladder; e, intestine; f, ureters.

their usual relations; in Ganoids and most Teleosts a large number of 'pyloric caeca' are given off at the beginning of the intestine; the pancreas is often diffuse or absent in Teleosts; except in the last-named order, but especially in Elasmobranchs, there is a spiral ridge running down the large intestine, greatly increasing its internal surface. In Elasmobranchs and Dipnoi the gut ends in a cloaca or common chamber, into which the urinogenital ducts also open. In other fishes the anus lies in front of and separate from the other aperture or apertures.

The food of fishes is very diverse, from minute Protozoa to whales; they are carnivorous, vegetarian, or virtually omnivorous. Worms, crustaceans, insects, and molluscs and other fishes are important items in the carnivorous diet, in which they are

usually voracious and often anything but discriminating. Some swallow mud for its living or decomposing contents; others, again, feed on sea and fresh-water weeds. The food is usually swallowed whole, though some sharks tear their prey into available pieces. Not a few forms manage to swallow other fishes out of all proportion to their own size, and in museums may be seen specimens which have managed to get outside victims even larger than themselves! Besides the formidable teeth of shark and the like, the modifications of the jaws in sword- and saw-fish are conspicuous adaptations to a highly-evolved carnivorous habit.

*Circulation.*—In all fishes, except the Dipnoi, the heart receives impure blood only. This is driven by the muscular chamber or ventricle to the gills, whence being purified it is collected into the dorsal aorta which gives off arteries to all parts of the body except the head, which receives a direct supply from the most anterior of the vessels returning from the gills. From the body anterior and posterior veins convey the impure blood into the heart, into the so-called *senus-venosus*, or porch to the auricle. Though the direct work of the heart is solely to drive impure blood to the gills, it need hardly be pointed out that, as the chief origin of the alterations of pressure which determine the circulation, the heart has its usual, though obviously indirect, systemic significance. Except in the bony fishes, the ventricle is prolonged into a contractile tube known as the *conus arteriosus*; but, except in the Dipnoi, the heart is accurately described as two-chambered. Venous blood from the posterior region passes through the kidneys, forming a renal-portal system, as in amphibians and most reptiles, and there is the usual hepatic-portal system wherein vessels from the intestine pass into the liver. The hepatic veins leading from the liver enter the heart independently of the other posterior veins, and thus there is no strict *inferior vena cava*. In the Dipnoi the circulation has been modified with the acquisition of lungs. The heart receives pure as well as impure blood, and the auricle is divided by a septum. Fishes have the usual lymph system, and the ordinary blood-glands—spleen, thyroid, and thymus.

*Respiratory System.*—From the pharynx the characteristic vertebrate clefts open to the exterior, and admit of a water current in by the mouth, down the pharynx, out by the clefts. Between the clefts extend the supporting (branchial) arches, and these bear the folds or filaments on which the blood is exposed—in other words, the gills. In the cartilaginous fishes the separate gill-clefts are obvious enough externally; in other fishes the apertures are protected by a fold or operculum, and the partitions which form a series of chambers in skate or shark become more or less reduced. Thus, in the haddock there is one external opening on each side, and the gill-filaments are borne upon arches which are only attached at their extremities. The number of gills or clefts varies considerably; there are usually five in Elasmobranchs, four in Teleostei. The primitive fish doubtless had a large number of gill-slits, and *Heptanchus* still survives with seven. In Elasmobranchs and some Ganoids the most anterior of the distinct gill-slits forms what is known as the 'spiracle,' opening on the top of the head, sometimes bearing a rudimentary gill, and lying in the position of the Eustachian tube in higher animals. In young Elasmobranchs, sturgeons, and many bony fishes there are to start with *external* gill-filaments, somewhat like those of a tadpole, while in Protoperus, one of the Dipnoi, there are three pairs of external gills in adult life. In the majority of

fishes, but not in Elasmobranchs, nor in bony flat-fish such as plaice, there is an Air-bladder (q.v.) or swim-bladder, which arises almost always as a *dorsal* outgrowth from the gut, and prophesies the lung of higher vertebrates. As the name suggests, its function is in most cases hydrostatic, raising or lowering the fish according to its state of expansion or contraction, and it always receives a supply of arterial blood. In the 'double-breathing' Dipnoi, which gulp air at the surface, the swim-bladder functions as a genuine lung, and the same is true to a less marked extent of a few other fishes. In all Ganoids and in the Physostomi section of bony fishes the connection between air-bladder and gullet remains throughout life an open passage; in the other bony fishes (Physoclisti) the connection is a solid cord or is altogether obliterated. The sac extends along the back under the vertebral column, and is exceptionally (e.g. *Polypterus*) double like lungs; in four families of Teleostei it is connected anteriorly with the ear by a chain of bones, 'by means of which its relative fullness can be appreciated by the fish.' Some bony fishes—e.g. climbing perch and certain Silurids—have curious accessory respiratory organs, and are able to remain for some time out of the water; and here also may be noted the dilatable sac which opens into the ventral side of the pharynx in some box or globe fishes—e.g. *Diodon*.

*Excretory System.*—To the zoologist the kidneys of fishes are of great interest, because it has been possible through the study of their development to reach an approximate elucidation of the 'homologies' or real resemblances in the different parts of the urogenital system throughout the vertebrate series. Only two general sentences are here permissible. At an early stage a segmentally arranged series of ciliated excretory tubules, or nephridia, make their appearance; they are strictly comparable to the excretory tubes of invertebrates, and a certain unity is thus demonstrable between earthworm and dog-fish. Of these little tubes some form the adult kidney, others the 'Wolfian body' or 'parovarium,' while others disappear. But, besides the tubules which lie transversely, there is on each side a longitudinal duct with which some at least of the nephridia become connected; this so-called 'segmental duct' is either derived, as the insinking of a skin (ectodermic) groove, or else from the external portion of the middle (mesodermic) layer; on each side it typically becomes double, and forms the reproductive ducts for either sex, but the half which is important in the male is rudimentary or unimportant in the female, and *vice versa*.

*Reproduction.*—The sexes are almost always separate, but a male organ or testis 'is constantly found imbedded in the wall of the ovary in *Chrysophrys* and *Serranus* (two bony fishes), and the last-named fish is said to be self-impregnating.' As in most other vertebrates, occasional hermaphroditism occurs as an abnormality—e.g. in mackerel and herring. The males of bony fishes are usually smaller than their mates, and sometimes very markedly so; in many cases, especially at the breeding season, they are further distinguished from the females by bright colouring. Thus, the male 'gemmeous dragonet' (*Callionymus lyra*) is so flushed with brilliant colour that it was regarded by Linnaeus as quite distinct from the 'sordid,' dingy female. The male sea-scorpion (*Cottus scorpius*), usually ill-favoured, becomes gorgeously adorned during the spawning season, and the same is true of a great many forms. In Elasmobranchs the males are distinguished by the possession of copulatory organs or 'claspers.' As the males often fight with their rivals, special adaptations have come to be associated with this habit; of these the hooked

lower jaw of the male salmon, so suitable for biting, is perhaps the most familiar instance. In many marine fishes the females appear to be in a very large majority. There are frequently other differences between the sexes, especially as regards the unpaired fins, and Darwin also quotes some cases (especially *Ophidium*) where it seems that the males, and the males only, have the power of producing sounds. See SEX, SEXUAL SELECTION. The ovaries and testes are almost always paired organs, which become large and conspicuous in the reproductive season. In all Teleostei save one, and in the bony pike (*Lepidostei*), there are ducts continuous with the ovaries; in other fishes the eggs burst into the body-cavity, and are subsequently pressed into the ducts. The male elements are likewise occasionally set free in the body-cavity (Dipnoi and Muraenidae), but usually pass more or less directly into ducts. In most Elasmobranchs, in Ganoids, Dipnoi, and a few Teleostei, there are two openings or 'abdominal pores' from the body-cavity to the exterior, which perhaps represent a primitive exit for the reproductive elements, and in a few cases still serve for that purpose. In the great majority, however, the reproductive ducts fulfil their usual functions, and open either into a cloaca in Elasmobranchs and Dipnoi, or behind the anus in Ganoids and Teleostei.

Most fishes are oviparous, laying the eggs as such, and that usually in great numbers. They are extruded on the bottom—e.g. among gravel—or in many cases are discharged broadcast in the water. A few fishes, such as sturgeon and salmon, ascend rivers for spawning purposes; while others, like the eel, descend to the sea. The female salmon is careful in the choice of a spawning ground, and in ploughing a groove for the eggs among the gravel is said to avoid areas which have been already occupied by her forerunners. In regard to brood, it has been observed that the absence of a suitable bottom may lead to retention of the ova, to consequent disease in the organ, and to an inferior brood the next season. The eggs of oviparous Elasmobranchs are surrounded by a chitinous case, the so-called 'moormaid's purse', so often found empty on the beach. This sheath is a product of the lower portion of the oviduct, and often has tendril-like prolongations at the corners, which twine themselves automatically round seaweed, where the embryos are rocked till the time of hatching. Most sharks and a few Teleostei bring forth their young alive. In the viviparous Teleostei the eggs develop in the ovary; in the sharks, in the lower portion of the oviduct. Two of the viviparous sharks (*Mustelus laevis* and *Carcharias glaucus*) are of peculiar interest in the establishment of a vascular placenta-like union between the yolk-sac and the wall of the oviduct, an arrangement which has also been noticed in a couple of lizards. In the Teleostean *Anableps* the yolk-sac has villi which protrude into a dilated ovarian chamber and absorb nutritive material. As to fertilisation, the usual process is that the male deposits the spermatozoa or the milt upon the laid eggs or spawn, but it is evident that fertilisation must be internal when the forms are viviparous or when the eggs are enveloped in a firm sheath.

*Parental Care* is but rarely exhibited by fishes, and then usually on the part of the males. Love for offspring usually varies inversely with their number; and those of fishes are legion; nor would young fish benefit much by any care, except an impossible providence which would prevent their being swallowed. Apart from numerous viviparous forms, the female of a Silurid genus (*Aspredo*) carries the ova on her belly till they are hatched, just as the Surinam toad bears her progeny on her

back; and in *Solenostoma* a pouch for the eggs is formed by the ventral fins and skin. The male stickleback (*Gasterosteus*) makes a nest of grass stems and water weeds, weaves it round with

Fig. 4.

The male of a Pipe-fish (*Syngnathus acus*), with pouch beneath the tail for carrying the eggs (after Günther).

mucons threads (which seem to be almost pathological products of the kidneys compressed by the enlarged male organs), and jealously guards the eggs laid by his mate. The same is said to be true of a species of *Chromis* from the Sea of Galilee; and more or less elaborate nests are formed by the males in the genera *Cottus*, *Cyclopterus*, *Antennarius*, *Ophiocephalus*, and *Callichthys*. 'The male of some species of *Arius* carries the ova about with him in his capacious pharynx,' while in the pipe-fishes and sea-horses various abdominal brood-pouches are developed.

*Development.*—The fish egg is a small thing, except in the cartilaginous fishes, where it is very large, and enclosed in the characteristic chitinous case. In other fishes there are only the usual egg-sheaths, such as the *zona radiata*, with one aperture or more for the entrance of the spermatozoon. Fertilisation usually takes place in the water, much less frequently within the female. Since the old experiments of Jacobi (1757-63), artificial mingling of the sperms and eggs has often been resorted to, both in the embryological laboratory and in the practical work of stocking rivers (see PISCICULTURE). In the egg the yolk usually bears a large proportion to the strictly formative material, and the division with which development begins is partial in all known cases except the sturgeon and the bony pike. Development is, in most cases, a

Fig. 5. —Young bony Fish, with dependant yolk-sac still unabsorbed.

rapid process, and the newly-hatched forms bear the still incompletely absorbed yolk-sac dependent from their ventral surface. The larval forms are often unlike the parents, for instance, in the possession of external gill-filaments in Elasmobranchs, &c., or in minor features connected with mouth, fins, and armature. The most striking change is that which happens to young, bony Flat-fish (q.v.). See EMBRYOLOGY, and such articles as SALMON.

*Relation to Environment.*—In many fishes the limit of growth is less definite and less rapidly attained than is usual among higher vertebrates. In favorable circumstances individuals will go on growing, and may far outstrip the average of the species, while, on the other hand, a confined habitat and restricted food-supply may reduce the size. 'The young of coast-fishes, when driven out to sea, where they find a much smaller supply of food, remain in an undeveloped condition, assuming a hydropic appearance.' Such, probably, are the

enigmatical Leptocephalidae. Besides affecting the size, the nature of the surroundings and the nutritive supply influence both form and colour. It is a well-known fact that the same species of trout presents a variable appearance, according to the habitat of the individual. It rarely happens among fishes that the pigment wholly disappears, but it is not uncommon for an 'incipient albinism' to be produced by a change of the contents of the pigment-cells into yellow, a variation most familiar in the gold-fish, but occurring in not a few. Very different, and of more importance in the life of the fish, is the power which some possess of sympathetic change of colour. Thus, in the plaice the colour of the environment influences the eye, a nervous impulse determining the contraction or expansion of the pigment-cells passes to the skin, and the animal is adapted to the colour of the ground on which it rests. Few general statements can be made as to the sensitiveness of fishes to changes in the medium. Pelagic fish are very susceptible; but other marine forms—e.g. flounders—thrive well in fresh water. 'A shark lives in Lake Nicaragua; a goby, blenny, and *Atherina* in the lakes of North Italy.' The passage of a fresh-water fish to the sea is very rare. Many fishes can endure prolonged fasting and also lowered temperature, but in both these respects marine forms are far excelled by those inhabiting fresh water. Low temperature causes some fishes to pass into a torpid state of 'Latent Life' (q.v.), or Hibernation (q.v.), while in the dry season of tropical countries other forms (e.g. Siluroids and Protopterus) encyst themselves in the mud, where they may remain like living mummies for prolonged periods. See also **BLIND FISH**.

Some small fishes live in amicable partnership with other animals—e.g. inside large sea-anemones (see **COMMENSALISM**). The genus *Pieraster* seems in a fair way to become parasitic, since the members find more or less permanent lodging within

Fig. 6.—*Pierasters* entering and leaving *Holothurians*.  
(From the atlas of the Naples Aquarium.)

sea-cucumbers, medusæ, and other animals, feeding, however, not upon their hosts, but upon the minute animals which they contain. Fishes themselves are infested by numerous internal and external parasites. Crustaceans, or Fish-lice (q.v.), occur in great abundance on skin and gills, especially on sluggish or on sickly forms. Various flukes are also found externally, and a large number of Cestodes in tapeworm or bladderworm stages live in the viscera. The pike and burbot are hosts of the immature stages of the formidable *Bothriocephalus*; the stickleback often bears the young of the fresh-water mussel; a peculiar hydroid (*Polypodium*) is parasitic on the eggs of the sturgeon; and so on through a long series (see **PARASITISM**).

**Distribution in Space.**—Most fishes live either exclusively in the sea or exclusively in fresh water, but some pass for spawning purposes from the one to the other, and not a few thrive with apparent

indifference in either or in a brackish medium. The marine forms enjoy a wider distribution over the globe, but the inhabitants of fresh water also spread by circuitous swimming, by changes in the river systems, and even by short overland marches, or by having their ova carried on the feet of water-birds. Both marine and fresh-water forms occur in Polar regions. Günther describes about forty species from the icy waters at or beyond the 1500 fathom line; and fishes are still present in Alpine lakes about the level of perpetual snow, up, indeed, to a level of 15,000 feet or more. Of genuine fresh-water fishes about 2300 species are recorded, of which four are Dipnoi, thirty-two Ganoids, and the rest Teleosteans, with a marked predominance of carps or Cyprinidae, and Siluroids or cat-fishes. The marine forms are usually distinguished as shore, pelagic, and deep-sea fishes. The shore fishes, including about 3500 species, frequent the coasts, and rarely descend below 300 fathoms. The pelagic fishes swim and usually spawn in the open sea, are less numerous than the shore forms, and thrive especially in the equatorial waters: the cartilaginous fishes form a large percentage of the pelagic fauna. The deep-sea fishes include over a hundred genera, most of which are Teleosteans. Of these forms, monographed by Günther in his *Challenger* Report, a little more must be said.

**Deep-sea Fishes** were not known with any definiteness till the *Challenger* expedition virtually discovered the new zoological world which they inhabit. The explorations of the *Tulisman* and the *Travailleur* have also contributed important results to our knowledge of these usually strange-looking forms. To understand their peculiarities it is necessary to recall the principal factors in their environment. (a) Sunlight is absent, and so often are eyes, which, in the absence of stimulus, remain undeveloped. It is interesting to notice Günther's results. From a depth of from 80 to 200 fathoms the eyes are larger than usual, to make the most of the scanty sun-rays which fade away at those depths. Beyond the 200 fathom line 'small-eyed fishes as well as large-eyed occur, the former having their want of vision compensated for by tentacular organs of touch, whilst the latter have no such accessory organs, and evidently see only by the aid of phosphorescence. In the greatest depths blind fishes occur, with rudimentary eyes, and without special organs of touch.' The Phosphorescence (q.v.) is produced by numerous marine animals and by the fishes themselves. Many of the latter exhibit round, shining, mother-of-pearl-coloured bodies, imbedded in the skin, in part sensory, in part phosphorescent. (b) The temperature of the bottom is low and equable, and a wide range of distribution is thus unimpeded. (c) The pressure is, of course, enormous at those great depths, and, though the fishes feel it as little as we do that of the air, it has doubtless been an

Fig. 7.—A deep-sea fish (*Chiasmodon niger*) which has swallowed another fish (seen beneath) bigger than itself (after Günther).

important factor in determining their structure. Bones and muscles are less developed; the former

are very light and brittle, the latter are thin. The forcible ascent to diminished pressure, of course, produces rupture and other changes, so that it is sometimes difficult to infer the natural form of the body and texture of the tissues. (d) As sunlight is absent, so also are plants. The abyssal fish are therefore carnivorous, 'the most voracious feeding frequently on their own offspring, and the toothless kinds being nourished by the animalcules which live on the bottom, or which "like a constant rain" settle down from the upper strata.' Some of the carnivorous forms show evidence of great rapacity, and not a few are characterised by wide gape and dilatable stomach, able to 'receive a fish twice or thrice the bulk of the destroyer.' The skin in many deep-sea fishes is marked by an extraordinary development of the mucus-secreting system, and this exuded layer has been observed

to be phosphorescent in some fresh specimens. The colouring is simple, most of the forms being either black or silvery. The absence of light and the sluggish habit may have something to do with this peculiarity. (e) Lastly, the perfect calm of the abyssal water must be remembered, and associated with the tendency many of the fishes have to develop long, delicate filaments on fins or tail. As to the maximum depth at which fishes certainly occur, *Bathypophis ferox* was dredged from 2750 fathoms.

**Classification.**—The chief technical characteristics of the four orders, Elasmobranchii, Ganoidei, Dipnoi, and Teleostei, may be summed up in the following table; but the articles BONY FISHES, CARTILAGINOUS FISHES, DIPNOI, and GANOIDS should also be consulted at this stage, as well as special articles on distinctive types.

|                      | Elasmobranchs.                                                 | Ganoide.                                                                       | Dipnoi.                                                                            | Teleostans.                                                                          |
|----------------------|----------------------------------------------------------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| SKIN .....           | With skin-teeth.                                               | Large hard scales.                                                             | Large soft scales.                                                                 | Usually soft scales.                                                                 |
| LIMBS .....          | Large; hind pair abdominal.                                    | Hind-limbs abdominal.                                                          | With a median axis.                                                                | Hind-limbs often far forward.                                                        |
| TAIL .....           | Asymmetrical.                                                  | Asymmetrical, or the same disguised.                                           | Symmetrical                                                                        | Apparently, not really, symmetrical.                                                 |
| SKELERON .....       | No investing bones; almost wholly cartilaginous.               | Investing bones on skull and pectoral girdle; otherwise cartilaginous or bony. | Persistent, undivided notochord; largely cartilaginous.                            | Well ossified, with completely formed vertebrae, and well-developed investing bones. |
| OPTIC NERVES .....   | Fuse with a crossing of fibres near the brain.                 | The same.                                                                      | The same.                                                                          | Cross without fusing.                                                                |
| GILL-APERTURES ..... | 5-7 opening externally, usually + a spiracle.                  | A cover or operculum; sometimes a spiracle.                                    | Covered internal gills, in one case + external.                                    | An operculum.                                                                        |
| SWIM-BLADDER .....   | None.                                                          | Present with persistent duct.                                                  | Functional as a true single or double lung. As Elasmobranchs.                      | Present, with or without persistent duct.                                            |
| INTESTINE .....      | Cloaca; spiral fold in intestine.                              | Anus separate from urogenital aperture; a spiral fold.                         | The same.                                                                          | No spiral fold; separate anus, and often separate urinary and genital apertures.     |
| HEART .....          | Contractile conus arteriosus.                                  | The same.                                                                      | The same and a septum between auricles.                                            | No contractile conus.                                                                |
| OVA .....            | Few, large, internally fertilised eggs; many forms viviparous. | Small, externally fertilised; oviparous.                                       | Numerous small eggs; oviparous, but little known.                                  | Numerous small eggs, externally fertilised, except in a few viviparous forms.        |
| ALIA .....           | Males with copulatory organs on hind-limb.                     | A decadent order with seven or so living genera.                               | Nostrils communicating with mouth. Three living genera transitional to amphibians. | The vast majority of living fishes.                                                  |

In addition to the four orders above contrasted, it is usual to distinguish a fifth—Holocephali—for the reception of *Chimera* (q.v.) and *Callorhynchus*. These two forms, of which no notice has been taken in the above general sketch, agree in most of their features with the Elasmobranchs, but differ, for instance, in the development of an operculum, in the distinctness of the anus from the urinary and genital apertures, and in the nakedness of the skin.

**History of Fishes.**—The earliest fish remains occur in the Upper Silurian strata, mostly in the form of spines, scales, shields, and mere fragments.

Fig. 8.—Restoration of *Pleuracanthus gaudryi* (Brogniart).

Some of these belonged to true sharks, but the armoured Ganooids (*Pteraspis*) were also alive in that ancient time. In the Devonian period both orders were represented, but the Ganooids greatly predominated, if the remains may be trusted as

affording a true index. In the Carboniferous the Ganooids continued their long golden age, and the Elasmobranchs were also abundant. We figure a remarkable form (*Pleuracanthus*) recently described from the French coal-measures, which the discoverer, M. Brogniart, regards as representing at least a distinct order, perhaps a sub-class, the '*Pleuracanthides*'—'a group ancestral to and connecting the Dog-fishes, Cestracionts, Rays, *Chimeras*, Sturgeons, and *Ceratodus*.' Very singular and novel are the two small anal fins, which are 'placed one behind the other, and have the appearance of true limbs.' In the Jurassic strata the modern types of shark and dog-fish become numerous, and have so remained ever since. Far otherwise the Ganooids; relatively few survived the Jurassic epoch, and the few genera now living form but a paltry remnant of a vast and heterogeneous host. Some of the ancient Ganooids exhibit characteristics which link them to the Dipnoi, and it is generally admitted that it was from Ganooid ancestry that the Dipnoi (which appear in the Permian) had their origin. The occurrence of the modern genus *Ceratodus* in strata so far back as the Permian 'presents the most remarkable instance of persistence in the whole range of vertebrate animals.' The Dipnoi form a transitional order, leading on to amphibians, and probably never included more than a progressive few. In another direction, but probably also from Ganooid ancestry, the modern bony fishes or Teleostei evolved. They appear for the first time in Creta-

ceous strata, 'being immediately preceded by the Teleostoid group of Ganoid fishes of the family Leptolepidæ, which effects a passage to them' (Heilprin). Forms with open swim-bladders, and forms in which the connection with the gut is closed, both appear early, but there is no doubt that the former (Physostomi) are the more primitive. Herring, smelt, pike, and other bony fishes of to-day occurred in the chalk period, but it was only in the Eocene or early Tertiary times that the modern fauna became established. Fresh-water forms must be regarded as derived from marine forms, and the change of habitat probably began in very early times.

To sum up—the first fishes were probably somewhat after the shark pattern; these were soon followed and outnumbered by Ganoid forms; in successive æons the Elasmobranchs increased and remained firmly established if not markedly progressive; the Ganoids on the other hand waned most markedly, but according to many they gave rise to the highly successful Teleostean type, and to the progressive transitional Dipnoi. At present the Teleosteans are, of course, in an overwhelming majority; next come the persistent Elasmobranchs, including *Chlamydoselachus*, a Japanese shark which is said to be the oldest living type of fishes, with

Fig. 9.—*Chlamydoselachus anguineus* (Garman), the oldest living type of Fishes:  
a, head on larger scale.

direct ancestors of Devonian antiquity; the eight or so living genera of Ganoids are a mere handful compared with the extinct forms; while the Dipnoi are only represented by three genera. As to the relations of fishes to the round mouths or Cyclostomata, to the lancelet or Amphioxus, to the Ascidians or Tunicata, and to still more remote worm-like forms such as *Balanoglossus*, it is only possible at present to say that all are offshoots from primitive vertebrate types.

**Economic Interest.**—Apart from the import of fishes in the general economy of nature, their practical interest for mankind is centred in the fact that so many form part of our food-supply. Their importance in this respect is especially great in Polar regions, where other sources of nutrition are scanty. It may be here noticed that many are temporarily or constantly poisonous. The poison is in the blood and is destroyed by heat in the eels; it is constant and in the flesh in *Clupea venenosa*, various globe-fish, and many others; it is temporary and in the roe of spawning pike, burbot, &c.; while in many cases it is not intrinsic, but due to the food on which the fish lives, or to decomposition products formed after death. Gills and other parts which quickly decompose should always be avoided. Some fishes, such as stingrays and weavers, readily give wounds with their spines, and the mucus of the body thus inoculated produces symptoms of poisoning. In Synanceia, Thalassophryne, and other forms there are true poison organs associated with spines, and the results of a wound are sometimes fatal. Besides the great nutritive utility of fishes, there are a few minor products of some importance, such as cod-liver oil from the liver of Gadoids, isinglass from the swim-bladder of sturgeons, &c., and

shagreen from the skin of sharks and rays (see PISCICULTURE).

From their position near the base of the vertebrate series fishes are the most hopeful subjects for the solution of many of the fundamental problems of zoology; in their endless variety of habit they afford wide scope to the observant naturalist; while for their grace of movement, beauty or quaintness of form, and splendour of colouring they merit a larger share than they have hitherto received of artistic attention.

**Fishes, ROYAL**—those which at common law are the property of the crown—are the Whale (q.v.) and the Sturgeon (q.v.), when either thrown on shore, or caught near the coast.

**Fish-guano.** See GUANO.

**Fish-hawk, or FISHING EAGLE.** See OSPREY.

**Fish-hooks.** Both in Europe and in America fish-hooks have been found, belonging to prehistoric times, which are made of flint, bone, shell, copper, bronze, and, on the latter continent, even of gold. The oldest apparatus for catching fish was not a hook, but a crossbar of flint sharpened at both ends and attached to a thong. Some of the oldest prehistoric fish-hooks, including a few of bone, bear

Early Fish-hooks (from Rau's *Prehistoric Fishing*):

a, lacustrine fish-hook, made of a bear's tusk, found at Moosseedorf, Switzerland; b, bronze lacustrine fish-hook, found at Romanshorn, Lake Constance; c, deer-horn fish-hook, found in Madison county, New York; d, shell fish-hook from Santa Cruz Island; e, cactus-spine Indian fish-hook from Arizona; f, halibut hook, made by the Makah Indians, Cape Flattery, from the knots of the hemlock spruce.

a considerable resemblance to modern English hooks in shape and in the form of the barb. Many of the rude-looking fish-hooks made by savage races are strong, well made, and ingeniously contrived. The

shell and bone hooks of the Maoris of New Zealand and the natives of the Solomon Islands, as well as the bone and iron hooks of the Eskimos, are examples of these. Curious fish-hooks of cactus spines, made by Indians, have been found in Arizona. Ancient Roman fish-hooks discovered at Pompeii exactly resemble those in use at the present day, only they are of bronze instead of steel. But almost as much may be said of the prehistoric bronze fish-hooks discovered in Scotland, Ireland, and at several places on the continent of Europe. Illustrations of a large number of ancient fish-hooks are given in a volume on *Prehistoric Fishing in Europe and North America*, by C. Rau, published by the Smithsonian Institution.

In England fish-hooks are chiefly manufactured at Redditch in Worcestershire. The best of these are still made by hand, and the following is an outline of the stages in the process. (1) Soft cast steel wire is cut by shears into lengths required for a given size of hook. (2) A number of these cut wires are placed on a plain surface against an upright, and then by means of a strong knife the beads or barbs are formed. (3) The points are next put on by carefully filing the wires, each being pointed almost in an instant. (4) By means of a mould mounted in a wooden handle the wires are bent or turned to the proper shape. (5) The ends of the shanks are now ringed, flattened, or marked by an ingenious machine or hammer. (6) At this stage the hooks are hardened—i.e. they are placed in a furnace and brought to a certain heat, which varies with the kind of hook, and then plunged into a vat of oil. (7) They are next tempered by placing them, mixed with emery sand, in a pot over a charcoal fire. There they are kept in constant motion till they are sufficiently tempered. (8) Seouring is effected by placing the hooks with water in barrels and keeping these in motion for one or two days, to remove all scale. (9) Polishing is done by placing the hooks in an oblong bag with emery and rapidly shaking them. Sometimes the polishing is done in barrels moving round at an angle of 45°. Fish-hooks are now, however, chiefly made by machinery which performs most of the above operations automatically.

A large firm who manufacture fish-hooks at Redditch, and who have published an account of the process, from which the above outline has been prepared, state that there are fifty-three different sorts of hooks. Among these there are the kinds known as Kirkby, Limerick, Dublin, Carlisle, Kendal, sneek, round bent, crystal, roach hooks, live-bait snap-hooks, lip-hooks, &c. See *ANGLING*.

**Fishing-frog.** See *ANGLER*.

**Fish-louse,** a name widely applied to any of the Copepod crustaceans which occur as external parasites both on fresh-water and marine fishes. Some have also been found on amphibians. As they live on the juices of their hosts, they undoubtedly do damage, and the fishes on which they are abundant are often sickly. They may occur on the skin itself, but are even more common about the gills. To the zoologist they have a special interest on account of the degeneration which they often exhibit, when contrasted with their free-living relatives or even with their own young stages. They are often curiously misshapen, and swollen out with abundant feeding; the males are sometimes free and the females alone parasitic, or the males may be pigmies borne on their mates. In other cases the females become truly parasitic only after sexual union, when about to bear eggs, and the habit of parasitism has doubtless been acquired in some instances for the safety and convenience of the mothers. Some (e.g. *Penella*) pass from being external hangers-on to become true internal para-

sites. The following are examples of common 'fish-lice' and of the hosts which they infest: *Chondracanthus cornutus*, on flat-fish (frequent); *Cutigus rapax*, dog-fish, gurnard, lump-sneker, dab, whiting, &c. (frequent); *Ergasilus sieboldii*, carp, pike, &c. (frequent); *Dichelasma sturionis*, sturgeon (on gills); *Lernæocera cyprinacea*, carp, &c. (boring in flesh); *Lernæa branchialis*, flounder, &c. (on gills); *Penella sagitta*, fishing-frog (in flesh); *Achtheres percarum*, perch, &c. (on gills); *Lernæopoda elongata*, dog-fish (on eyes); *Anchorella uncinata*, eel species (on fins and gills); *Argulus foliaceus*, carp, perch, pike, stickleback, trout, &c. (frequent). The above are all Copepods—i.e. low down in the crustacean series; but parasitic Cirripedes (q.v.) occur in the skin of whales and fishes, and on other crustaceans; a little family of Amphipods (Cymadidæ) also infest eelaceans; among Isopods, many Cymothoidæ live on the skin and gills of fishes, while a still larger number of the related Bopyridæ and Eutoniseidæ frequent other crustaceans. See *CRUSTACEA, PARASITISM*.

Fish-louse (*Achtheres percarum*), magnified.

**Fish River Caves.** See *BLUE MOUNTAINS*.

**Fisk University.** See *NASHVILLE*.

**Fissirostres** (Lat., 'split-beaked'), one of the tribes into which the great order Passeres or Insectores used to be divided. The name refers to the width of gape, associated with the habit of catching insects on the wing. Swallows, swifts, and goat-suckers were included in this old-fashioned title.

**Fissurellidæ.** See *LIMPET*.

**Fistula**, in former times, was applied, in its etymological meaning of a *pipe*, to such Abscesses (q.v.) as had contracted to narrow, hard, open passages in the soft tissues of the body, lined by a kind of false membrane, giving rise to a thin discharge. At the present time, however, the term fistula is generally limited to such a passage when in communication with, or in the immediate neighbourhood of, one of the mucous canals; elsewhere it is called a Sinus (q.v.). Thus, it is common to speak of salivary fistula, urinary fistula, &c.; but the most common and troublesome kind of all is the *fistula in ano*, in connection with the lower bowel, or Rectum (q.v.; and see *ANUS*). The term is also applied to unnatural communications between two adjacent mucous canals (e.g. vesico-vaginal fistula), or between one of these and the external surface (e.g. gastric fistula, fecal fistula), independently of their size and shape. The treatment of fistula should only be entrusted to experienced surgeons; but there are always quacks in abundance willing to undertake it, and hold out flattering hopes of an early cure without proper surgical procedure.

For the cure of salivary or urinary fistula all that is generally necessary is to restore the patency of the natural ducts, which is done by passing instruments along them. Should a fistula, however, be situated where it is surrounded by muscular fibres, as at the orifice of the lower bowel, it is necessary to divide these, so as to leave the part at rest while nature repairs it. During the process of healing care must be taken that the wound closes from the bottom, otherwise the cut surfaces are apt to reunite, leaving the fistula unimproved. This may be secured either by stuffing the wound with lint, or by daily passing a probe or a finger along it to break down any adhesions that may have formed. Stimulant applications are also

sometimes necessary to promote the healing process.

At times, however, fistulæ require more elaborate treatment, and are extremely difficult to close, especially those which result from loss of tissue between two adjacent mucous canals; fortunately, however, modern surgery is able to remedy these also. It is necessary to make the edges of the orifice once more raw, and to bring them in contact, but formerly the wound used rarely to unite, as the stitches produced such an amount of irritation. Now, however, by the use of silver-wire, or catgut, and by scrupulous attention to cleanliness, the parts can be kept together long enough to insure union; and thus, by the ingenuity of American surgeons, especially the late Marion Sims of New York, and others in Britain, certain diseases of women, arising from protracted labours, and formerly rendering the unfortunate subjects of them miserable and unfitted for any of the duties of life, may be now remedied by a skilfully performed operation. See E. and E. W. Andrews, *Rectal and Anal Surgery* (2d ed. Chicago, 1889).

**Fistularidæ.** See FLUTE MOUTHS.

**Fistulina**, a genus of Hymenomycete fungi allied to *Boletus* (q.v.), family *Polyporei*; the under surface (*hymenium*) at first covered with minute warts, which ultimately form separate tubes. *F. hepatica* is common in Britain and throughout Europe on old oak, walnut, and chestnut trees; it occurs also on ash and beech. It is semicircular, of very regular outline, with a lateral

*Fistulina hepatica.*

stem, or none; its colour red; its substance fibrous and fleshy, much resembling beet-root. When old and beginning to decay, it looks like a mass of liver. It sometimes attains a great size. Mr Berkeley mentions one which grew on an ash pollard, and weighed nearly thirty pounds. This fungus, while young, is much esteemed in some parts of Europe as an esculent; whilst there is almost no possibility of confounding it with any dangerous fungus. Its taste resembles that of the common mushroom, but is rather more acid. 'When grilled, it is scarcely to be distinguished from broiled meat.' It furnishes itself with abundance of sauce.

**Fitch**, JOHN, inventor, was born in what is now South Windsor, Connecticut, in 1743, and after a short, unhappy, married life, and a period of wandering, settled at Trenton, New Jersey. At the outbreak of the revolution he became a gunsmith for the American troops, with whom he wintered at Valley Forge. He next made surveying and trading tours in the West, and after escaping from captivity among the Indians returned to Pennsylvania, where in 1785 he completed his first model of a steamboat; this had wheels at the sides, which were replaced in the following year with paddles or oars. In the face of discouragement and neglect he succeeded in constructing a vessel, 45 feet long and 12 feet beam, with an engine of 12-inch cylinder, which made a successful trial-trip on the Delaware, at Philadelphia, 22d August 1787. Larger vessels were built in 1788 and 1790, the latter being run as a passenger-boat, at eight miles an hour, to Bur-

lington (20 miles) throughout the summer. Misfortune, however, dogged 'poor John Fitch's' steps; his supporters fell away; and in 1793 he went to France to construct a steamboat, only to find his project frustrated by the Revolution there. It is said that his plans and specifications were deposited with the American consul at L'Orient, who for several months entrusted them to Robert Fulton (q.v.); and the latter's steamboat certainly was in 1817 declared by a committee of the New York legislature to be 'in substance the invention patented by John Fitch in 1791.' Penniless and dejected, Fitch worked his passage back to America, where in the summer of 1798 he is said to have committed suicide in a tavern at Bardstown, Kentucky.

**Fitchburg**, a city of Massachusetts, on the Nashua River, at the junction of three railroads, 50 miles WNW. of Boston. It has numerous paper-mills, and manufactures of machinery, chairs, pianos, and tools. Pop. (1880) 12,429; (1885) 15,375.

**Fitches.** See VETCHES.

**Fitchy**, or FITCHÉ, in Heraldry. See CROSS.

**Fits**, a name popularly applied to any sudden seizure of disease implying loss of consciousness, or any considerable change in the condition of the mind, but particularly to attacks of Epilepsy (q.v.), and other forms of Convulsions (q.v.).

**Fitz** is an old Norman-French word signifying 'son,' from the Lat. *filius* (Fr. *filz*); the old spelling is usually *fiz*, another later form being *filz*. Like the Scotch *Mac*, the Irish *O'*, and the oriental *Ben*, it is prefixed to proper names to signify descent, as in the Norman names Fitzwilliam, Fitzwalter, Fitzgerald. A later application of it has been to denote the natural sons of royalty, as in Fitzroy, Fitzjames (see BERWICK, DUKE OF), and Fitzclarence.

**Fitzgerald**, LORD EDWARD, a prominent member of the society of United Irishmen, was a younger son of the Duke of Leinster, and was born at Carton Castle, near Dublin, October 15, 1763. After his father's death he was brought up in France, but returned to England in 1779 to enter the army. He served with distinction in the American war, next sat for Athy in the Irish parliament, and was drawn to Paris by the resistless spell of the great Revolution. Here he renounced his title of nobility, and married Pamela, daughter of Madame de Genlis by *Egalité* Orleans, next returning to Ireland in 1793, to plunge ere long into the troubled sea of political conspiracy. He joined the United Irishmen in 1796, and went to France to arrange for a French invasion of Ireland. Soon after his return the plot was betrayed to the government, and Fitzgerald, after a few days of hiding in Dublin, was seized, not without a desperate scuffle, in which he received wounds of which he died, sixteen days later, 4th June 1798. See the *Life by Moore* (2 vols. 1831).

**Fitzgerald**, EDWARD, was born March 31, 1809, at Bredfield House, near Woodbridge, in Suffolk. His father, John Purcell, took his wife's family name on her father's death in 1813. In 1816 the family went to France, and lived for a time at St Germain, and afterwards at Paris. In 1821 he was sent to King Edward VI's School at Bury St Edmunds, where James Spedding, W. B. Donne, and J. M. Kemble were among his schoolfellows. He went up to Trinity College, Cambridge, in October 1826, where Spedding joined him the next year, and where he formed fast friendships with Thackeray, W. H. Thompson, afterwards Master of Trinity, and John Allen, afterwards Archdeacon of Salop. He took his degree in January 1830.

His father's family resided at Wherstead Lodge, near Ipswich, from 1825 to 1835, and subsequently at Boulge Hall, near Woodbridge; there he lived with them until 1838, when he took up his separate residence in a cottage near the gate of Boulge Hall. His life at this time was a quiet round of reading and gardening, occasionally broken by visits from or to friends; his chief friends in the neighbourhood were the Rev. C. Crabbe, the son of the poet, and vicar of Bradfield, Archdeacon Groome, and Bernard Barton, the Quaker-poet of Woodbridge, whose daughter he afterwards married. Every spring he used to make a long visit to London to see his friends. There he constantly met Donne, Spedding, and Thackeray, and was a frequent visitor at Carlyle's house. Lord Tennyson and his brother Frederic had been his contemporaries at college; but it was in London that they became intimate; how fast the friendship was is best shown by Lord Tennyson's dedication of *Tiresias*. In 1853 he left the cottage and settled near Woodbridge, and afterwards in the town itself; but in 1874 he removed to Little Grange, a house which he had built for himself in the neighbourhood. His great outdoor amusement in these years was yachting; and every summer was spent cruising about the Suffolk coast, especially near Lowestoft and Aldborough, the latter locality being of great interest to him as associated with the poems of his favourite, Crabbe. He thoroughly enjoyed the life on his yacht, carrying his books with him, and delighting to take his friends for short trips, when they might read and talk over well-known passages together. He also enjoyed the rough, honest ways of the sailors and fishermen; and he liked to collect their peculiar words and phrases. But he could not escape 'the browner shade' which Gibbon ascribes to the evening of life, and the sea gradually lost its charm; one old sailer died, and another grievously disappointed him; and he at last gave up the yacht for his garden, where his favourite walk was called the 'Quarter-deck.' He died suddenly, June 14, 1883, while paying his annual visit to his friend the Rev. C. Crabbe, the poet's grandson, at Meriton Rectory, Norfolk. One of his great characteristics was steadfastness in friendship; he was slow to form intimacies, but, once riveted, the link lasted till death. His outward manner was reserved, and he might sometimes seem a little wayward or petulant; but under all this cold exterior there lay a tenderness like Johnson's, and a fine stroke of imagination or a noble deed would make his voice falter and his eyes fill with tears.

The first forty-two years of his life passed in quiet reading and thinking, and it was not till 1851 that he published anonymously his dialogue on youth, *Euphranor*, which was followed by *Polonius* in 1852. In the meantime a friend had persuaded him to begin Spanish, and this not only opened a new world of interest, but revealed to him his own powers. He at once took to Calderon's plays, and afterwards to *Don Quixote*, and in 1853 he published a translation of six dramas of the former with his name attached; but he soon withdrew it from circulation, and two more were afterwards printed privately. About 1853 the same friend interested him in Persian. Sa'di's *Gulistan* early attracted him by its quaint stories, and in 1856 he published an anonymous version of Jami's *Salimán and Absál*; and he also wrote, but never printed, an abridgment in verse of 'Attár's *Mantik ul ta'ir*. But the Persian poet who most interested him, from the time of his first seeing his works in 1856 in a MS. in the Bodleian Library, was 'Omar Khayyám, the astronomer-poet of the 11th century. These poems were then known only by a few current quotations, as they were first printed at

Paris in 1837 by M. Nieolas; but Fitzgerald at once recognised their beauty, and his name and the poet's will probably remain indissolubly linked together. Here his genius as a translator appears at its height. He possessed to an extraordinary degree the power of reproducing on his reader the effect of the original; and, though the original ideas are often altered, condensed, and transposed in an apparently reckless way, these lawless alterations and substitutions are like those in Dryden, and they all tell; the translator becomes the 'alter' and not the 'dimidiatus Menander.' His letters and collected works have been edited by Mr W. Aldis Wright (3 vols. 1889).

**Fitzherbert**, Mrs., a Roman Catholic lady, born Maria Anne Smythe in 1756, to whom, after she had been a second time left a widow, the Prince of Wales, afterwards George IV., was secretly married in 1785 by an Anglican clergyman. This marriage, contracted without the king's consent, was of course invalidate under the Royal Marriage Act of 1772; but the prince carried his meanness so far as to persuade Fox to deny that there had been a marriage at all, and afterwards denied that he had done so. On his marriage to the Princess Caroline in 1795 the connection was broken off for a time, to be resumed with the pope's consent, and finally broken off in 1806. Mrs Fitzherbert, whose conduct in trying circumstances has been warmly praised, died at Brighton, 20th March 1837. See her Memoirs, by Langdale (1836).

**Fitzroy**, the largest river of Western Australia, has its sources in the King Leopold Range, and, after describing a wide curve to the south, reaches the sea at the southern end of King Sound. Its total length is about 300 miles, the lower 100 of which are navigable for small boats. Its valley is a well-grassed country. The river was discovered by Stokes in 1838, and explored for about 250 miles by Alexander Forrest in 1879.

**Fitzroy**, ROBERT, admiral and meteorologist, a grandson of the third Duke of Grafton, was born at Ampton Hall, near Bury St Edmunds, July 5, 1805, and entered the navy in 1819. His first important work was that of surveying the coasts of Patagonia and Tierra del Fuego, 1823-30; and this work he was charged to continue on his reappointment to the command of the *Beagle* in 1831. On this voyage he was accompanied by Darwin, the two together publishing in 1839, three years after their return to England, a *Narrative of the Surveying Voyages of H.M.S. 'Adventure' and 'Beagle,'* vols. i. and ii. by Fitzroy, and vol. iii. by Darwin. For two years (1843-45) he was governor of New Zealand, then a newly-constituted colony. Although placed on half-pay in 1850, he was promoted in due course to be rear-admiral (1857) and vice-admiral (1863) on the retired lists. In 1854 he received an appointment in the meteorological department of the Board of Trade, his attention being principally given in his later years to meteorology and the lifeboat service. The cheap and serviceable 'Fitzroy barometer' was made on a plan suggested by him; and it was he who instituted the system of storm warnings that has grown into the daily weather forecasts. Among his works are *Meteorological Observations* (1859), and *Weather-book* (1863), as well as *Remarks on New Zealand* (1846). He put an end to his own life, in a fit of mental aberration, 30th April 1865, at Norwood in Surrey.

**Fitzwilliam**, WILLIAM, Earl Fitzwilliam, was born in 1748, and, succeeding his father in 1766, took his seat in the House of Lords in 1769. He at first opposed Pitt, to whom he afterwards went over, with a considerable portion of the Whig party, owing

to the excesses of the French Revolution. As lord-lieutenant for three months of Ireland (1794-95), where his warm support of Catholic emancipation aroused enthusiastic hopes, he was considered by Pitt too liberal; and his recall was followed by the rebellion of 1798. He was president of the council in the Grenville ministry, in 1806, and took some part in the Reform Bill agitation. He died 5th February 1833.

**Fiume** (Illyr. *Rika*, Lat. *Favum St Viti ad flumen*), an important seaport of Hungary, at the mouth of the Fiumara, 142 miles WSW. of Agram by rail, and 35 miles ESE. of Trieste across the Istrian peninsula, stands at the head of the beautiful Gulf of Quarnero, in the Adriatic, where the Julian Alps end. It consists of an old and new town, the latter, on the sea, being well built and laid out with many handsome streets and squares. Its extensive industries include manufactures of paper, torpedoes, tobacco (government factory, with over 2000 hands), sails, ropes, chemicals, starch, liqueurs, &c., besides a large petroleum-refinery, American flour-mills, and a rice-shelling factory. The tunny-fisheries of the Gulf also are valuable. Fiume's chief importance, however, is as the entrepôt of a great and steadily increasing commerce. A free port from 1717 till 1891, it has a harbour with a lighthouse and several breakwaters, which was greatly improved by the Hungarian government in the years following 1872, when new moles and quays with warehouses, and petroleum and other docks, were added, at a cost of nearly a million sterling, with the immediate effect of increasing the trade fivefold within the next twelve years. Moreover, further works were projected in 1888, to cost nearly half a million. In 1887 the exports amounted to £4,288,163, chiefly flour and grain, oak staves and timber, prunes, wine, mineral waters, sugar, and torpedoes; the imports reached £1,631,546, rice, crude petroleum, tobacco, wine, coffee, and cotton goods being the principal items. The trade is almost entirely a transit trade, even the petroleum and rice going forward into the interior after manipulation. Nearly half of the entire foreign trade is carried under the British flag; the aggregate direct trade in British vessels has increased, almost without a check, from £300 in 1876 to £1,638,872 in 1887; and the indirect or carrying trade from £27,700 to £1,067,524 within the same years. The chief imports from Britain are cotton goods and yarn, American tobacco, machinery, and coal; a large quantity of paddy rice and jute are imported from British India. Area of town and territory, over 12 sq. m.; pop. (1889) 22,029.—The county of Fiume, belonging to Croatia, lies to the east, between Carniola and the sea, and is almost entirely filled by the Karst range. In the relatively small valley area, and along the coast, olives, figs, pomegranates, and citrons flourish. Area, 1000 sq. m.; pop. (1881) 81,070. See Litrow, *Fiume und seine Umgebungen* (Fiume, 1884).

**Five Members, THE**, were those members of parliament—John Pym, John Hampden, Denzil Holles, Sir Arthur Haselrig, and William Strode—whom Charles I. endeavoured to arrest on 4th January 1642. This action, by which Charles had meant to prevent the impeachment of the queen, precipitated the Civil War. See CHARLES I.

**Five-mile Act**, an Act passed in 1665, enacting that no Nonconforming clergyman should be allowed to come within five miles of a corporate town, or of any place where he had once ministered, nor act as a tutor or schoolmaster, unless he first took the oath of non-resistance, and expressed his willingness to make no attempt to alter the constitution of either church or state.

**Fives**, a game of hand-ball still popular in England, chiefly at the great public schools. The game existed at least as early as the 14th century, both in France and England, being termed 'palm-play' in the former, and 'hand-tennis' in the latter; its name is derived from its being played with the 'bunch of fives'—i.e. hand. The principle of the game is very simple, although the minor rules depend largely on local tradition. In a 'single' one player constitutes a side; in a 'double' there are two on either side. A roomy court is requisite, bounded by a high wall at one end, and against this wall a ball is propelled by striking it with the open hand. A 'close' court has also two side walls, and the whole is sometimes covered. The game is begun by one player striking the ball against the wall, and causing it to rebound anywhere beyond the floor-score, which is about two yards from the wall; the ball as it rebounds is then returned by the opposing sides alternately, a player's stroke counting a failure whenever the ball does not touch the wall higher than three feet from the ground, and the opposite side scoring one. The ball may be struck either from a direct rebound before it reaches the ground, or after it has 'dapped' or hopped from the ground once. Fifteen is usually game. When the players are skilful the ball is kept going by the alternate strikers for many minutes at a time, and the game is thus rendered exciting both for players and onlookers.

**Fixed Bodies** is a term applied in chemistry to those substances which remain fixed, and are not volatilised at moderately high temperatures.—*Fixed Air* was the name given in 1756 by Dr Joseph Black (q.v.) to what in 1784 was named by Lavoisier Carbonic Acid.—*Fixed Oils* are those oils which, on the application of heat, do not volatilise without decomposition. See OILS.

**Fixed Stars.** See STARS.

**Fixtures**, THE LAW OF, is very much the same in England and Scotland. The general idea of a fixture is that a movable has been fastened to the soil or to a house, and has thus become the property of the owner of the soil or house. Such questions arise frequently between vendor and purchaser, heir and ordinary creditors, heir and executor, landlord and tenant. The last case is that most favourable for the right to remove a fixture. The first question is, however, whether the movable has become a fixture. There are constructive fixtures—e.g. the keys of doors, certain loose pieces of machinery, the bell of a factory, &c. In general, however, there must be physical annexation. Apart from this the main tests are: (1) can the thing be taken away without material injury to itself or to the premises? (2) is it essential, or material, or specially adapted to the enjoyment of the premises? In a famous case saltpans were held to be fixtures, because, though they could be removed without much injury, they were necessary to the use of the premises. But, further, especially between landlord and tenant, it is important to know what was the purpose of annexation, the intention of parties; were the things intended for perpetual or for temporary use? In *non-agricultural* subjects there are two main classes of fixtures—viz. those put up for ornament, convenience, or domestic use, and those put up for purposes of trade. The removability of the first class is a good deal settled by custom. The character of the article may show it to be purely temporary, otherwise the test must be whether the injury of detachment would be substantial. In dwelling-houses, for instance, pier-glasses, ornamental chimney-pieces, grates, book-cases screwed to the wall, are all regarded as

movables, and therefore removable by the tenant. Of course, injury caused to the premises by removal must be repaired by the tenant. In trade, on the other hand, nearly all fixtures are removable by the tenant, if there is no custom or stipulation to the contrary. Bakers' ovens, colliery-engines, spinning-mules, trees and glass frames in a nursery, are not put up by the tenant with any view of benefiting the landlord. Such questions are frequently settled by a remit to a practical man acquainted with the practice of the particular trade. As regards agricultural subjects, the law in both England and Scotland is now largely statutory. The English and Scottish Agricultural Holdings Acts of 1883 place the agricultural tenant (which includes pastoral, market-garden, and mixed holdings) in almost as good a position as the commercial tenant. To some extent this had been accomplished for England by a previous act in 1851. Prior to these statutes everything physically annexed by the tenant became the property of the landlord without compensation. The general statutory rule now is that, as regards any engines, machinery, fencing, and other fixtures and buildings for which the tenant is *not* entitled to compensation under the statutes, he is entitled to remove them without damage, if he has given a month's notice, and has paid his rent. The landlord, however, by counter notice, may purchase at a valuation. The Irish land legislation of recent years resolves everything into compensation, but formerly the tenant's right was the same as in England and Scotland.

**Flabellum** (Lat.). See FAN.

**Flaccus**. See HORACE, and FESTUS.

**Flaccus**, C. VALERIUS, a Roman poet, who flourished in the time of Vespasian, but of whose life nothing is known. He wrote the *Argonautica*, an unfinished epic poem, a good example of learned mediocrity rather than of genuine inspiration. The chief editions are those of Thilo (1863) and C. Schenkl (1871). An English metrical translation seems to have been published by one Nicholas Whyte as early as 1665.

**Flacius**, or VLACICH, MATTHIAS, surnamed Illyricus, a pupil of Luther and Melancthon, was born at Albana, in Illyria, in 1520. He studied at Basel, Tübingen, and Wittenberg successively, and became professor of the Hebrew Scriptures at this last-named university in 1544. From this time he took an active part in all the theological discussions of the time; and for his attacks upon Melancthon's compromise, known as the Leipzig Interim, he was, four years later, deprived of his professorship. Nor did he procure another appointment until 1557, when he became professor of Theology at Jena. This post he again lost, after holding it for five years, on account of his doctrine that original sin was essentially inherent in man's nature. After this he led a wandering life, dying in great poverty at Frankfurt-on-Main in 1575. Of his numerous works three deserve mention—*Clavis Scripture Sacre* (1567), *Catalogus Testium Veritatis* (1556), and *Eccelesiastica Historia* (1559-74). It is said that Flacius, in order to gather materials for his work, visited, in the disguise of a Franciscan monk, several monastic libraries throughout Europe, and purloined from them such MSS. as were useful to him, amongst those thus stolen being the original of Fordun's *Scotichronicon*, which, with other MSS., was after his death purchased by the Duke of Brunswick for the library at Wolfenbüttel. The history, called *Magdeburg Centuries*, was only partly written by him. See CHURCH HISTORY, and Preger's monograph (1861).

**Flag**, a popular name for many monocotyledonous plants with sword-shaped leaves, mostly

growing in moist situations. It is sometimes particularly appropriated to the species of Iris (q.v.) or Flower-do-luce, especially to the common yellow flag (*I. pseudacorus*); but is given also very indiscriminately to other plants of similar foliage, as the *Acorus calamus* (see ACORUS), which is called Sweet Flag. It is even frequently applied in the United States to some of the algae—c.g. Fucus (q.v.).

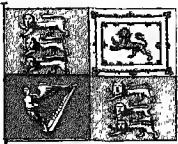

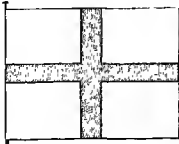

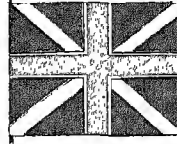

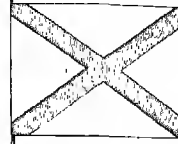

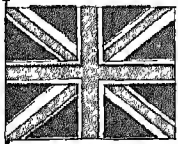

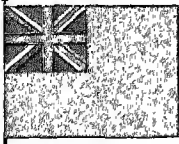

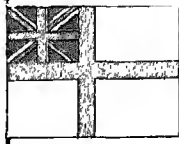

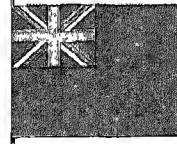

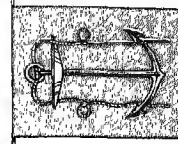

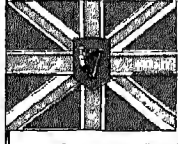

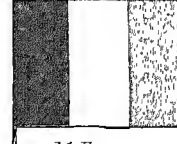

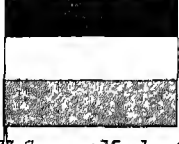

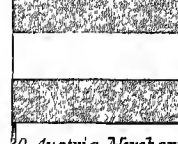

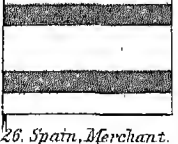

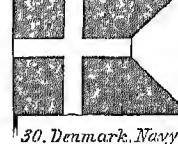

**Flag**, a strip of some light fabric attached at one end to a staff, used as a national, local, or corporate emblem, for military and naval purposes, to express rejoicing, mourning, and the like, or to make known some fact to spectators. As a military ensign it was probably developed out of the fixed standard of the Romans and other ancient nations, through the transitional forms of the *velillum* and *labarum*, in both of which a square piece of cloth was fastened to a cross bar at the end of a spear. It has, however, been asserted that the Saracens used flying flags prior to their adoption by any country of Christendom. One of the earliest known forms of flag was the *Gonfanon* or *Gonfalon*, which was borne near the person of the commander-in-chief, and fixed in a frame in which it could turn. The Bayeux tapestry, in the representation of the Norman Conquest of England, exhibits numerous flags as borne by the knights of William's army. The gonfanon of the Conqueror had three ends, and was charged with a golden cross on a white ground within a blue bordure. The other flags are chiefly small, often three-pointed, and bearing figures which may be considered anticipations of the pales, roundels, and crosses of heraldry. At the battle of Northallerton in 1138 the English standard is said to have consisted of the mast of a ship fitted into a high four-wheeled carriage. On the top of the mast was a silver pyx with a consecrated host. There were displayed from it three banners dedicated respectively to St Peter, St John of Beverley, and St Wilfrid of Ripon. In 1244 Henry III. of England ordered a dragon to be made in fashion of a standard of red silk sparkling all over with fine gold, whose tongue should resemble burning fire, and appear to be continually moving, the eyes being of sapphires or other appropriate stones. Besides the gonfanon, three kinds of flag were much in use in the middle ages—the Pennon, the Banner, and the Standard.

The *Pennon* was an ensign of knightly rank, only, however, to be used by a knight who had followers to defend it; it was carried below the lance-head, and was of a tapering, sometimes swallow-tailed shape, exhibiting in earlier ages some decorative design, and, after the introduction of heraldry, sometimes the badge, sometimes the arms of its owner. The arms were so represented as to be in their right position when the lance was held horizontally. A diminutive flag of the same kind, called the *Pennoncel*, was carried by the esquires.

The *Banner* (q.v.), rectangular in form, was borne by a king, prince, duke, or any other noble down to a knight-banneret (see BANNERET). The owner's coat of arms covered its entire surface, no shield or external ornaments being displayed; such at least was the uniform practice until the 17th century. The *Siege of Carlaverock*, a Norman-French rhymed chronicle of the 14th century, describes the arms on the banners of all the nobles and knights-banneret who wore with Edward I. in his campaign against Scotland in 1300.

The *Standard*, strictly so called, a large, long flag, tapering towards the fly (or edge farthest from the staff), and slit at the end, was much in use among persons of distinction in the last half of the 14th, and in the 15th and 16th centuries. Its

|                                                                                     |                                                                                     |                                                                                     |                                                                                     |                                                                                      |

## NATIONAL FLAGS.

Engraved & Printed by W. & A. K. Johnston, Edinburgh & London.

particular departments of the service. The lord-lieutenant of Ireland, for example, has the union flag with a blue shield in its centre charged with a golden harp (fig. 11). The governor-general of India has, in the centre of the union flag, the Star of India with a crown over it (fig. 12). British ministers at foreign courts have also the union flag, and in its centre the royal arms within a white circle surrounded by a wreath (fig. 13). British consuls have the blue ensign with the royal arms in the fly. Vessels in the service of British colonies have the blue ensign with the badge of the colony in the fly.

The *long pendant*, a familiar flag in the navy, is some 20 yards long, and very narrow and tapering. As flown from the mast-head of all ships of the Royal Navy in commission, it is white with a red cross. Such vessels in the service of British colonies as are commissioned as vessels-of-war under Act 28 Vict. chap. 14 wear the long pendant, but blue with a red cross on a white ground next the mast. There is also the *broad pendant* or *burgess*, a slightly tapering and swallow-tailed flag, white with a red cross, flown by a commodore or the senior officer of a squadron to distinguish his ship. If used by a commodore of the first class, it is flown at the main-topgallant mast-head, otherwise at the fore-topgallant mast-head.

The Scottish lion and the Irish harp, taken separately, but figured as they appear on the royal standard, are used in Scotland and Ireland as national flags, but have no official recognition.

In the following notice of the flags of other maritime nations the technical language of heraldry is as much as possible avoided. The word *standard* is used for the flag of the sovereign, and the form of flag is assumed to be rectangular unless otherwise described.

**France.**—As royal standard, the blue hood of St Martin was succeeded by the plain red oriflamme (the standard of the abbey of St Denis), and the oriflamme in the 15th century by a blue standard powdered with fleurs-de-lis, the fleurs-de-lis being, as in the arms of France, eventually reduced to three in number. The white flag afterwards became the standard in the reign of Henry IV. The history of the national flag is somewhat confused prior to 1794, when the tricolor of three vertical divisions, blue, red, and white (fig. 14), was adopted. The white flag was reintroduced as royal standard and national flag at the restoration of monarchy, giving place again in 1830 to the tricolor, which has ever since been used both in the navy and as mercantile flag. Under the two empires the imperial standard was the tricolor, powdered with golden bees, the central stripe being charged with the eagle of the empire.

**Germany.**—The standard of the German empire (fig. 15) has the iron cross (technically a cross patée sable fimbriated argent) on a gold or yellow field, each quarter being charged with three black eagles and an imperial crown, and over the whole a yellow or gold shield, with the imperial arms ensigned with a crown and surrounded by the collar of the black eagle. The naval ensign (fig. 16) is white, divided by a black cross of which the arm next the flag-staff is shorter than the other, and in the outer section of the cross is the Prussian eagle on a white field. The upper quarter next the flag-staff is composed of three horizontal stripes of black, white, and red, and has in its centre the iron cross. The flag of the merchant service consists of three horizontal stripes of black, white, and red (fig. 17).

**Austria.**—The imperial standard (fig. 18) is yellow, displaying the eagle of the empire, and has an indented border of gold, silver, blue, and black. The man-of-war's flag (fig. 19) has three horizontal divisions, the central one white, the other two red :

on the central division is a shield striped as the flag, with a narrow gold border, and ensigned with the imperial crown. The flag of the merchant service (fig. 20) is the same, but without the shield or crown. The Austro-Hungarian mercantile flag (fig. 21) has the lower stripe half red and half green, with two shields containing respectively the arms of Austria and of Hungary.

**Russia.**—The standard is yellow, charged with the arms of the Russian empire. The naval ensign (fig. 22) has a blue saltire on a white ground. The merchant flag (fig. 23) consists of three horizontal stripes of white, blue, and red.

**Italy.**—The royal standard, white with a blue border, displays the full armorial achievement of the king of Italy. The flag of the navy (fig. 24) has three vertical stripes of green, white, and red ; in the centre is a red shield charged with a white cross and bordered with blue (the arms of the dukes of Savoy) ensigned with the crown. The mercantile flag is the same, without the crown.

**Spain.**—The standard is entirely occupied with the quarterings of the Spanish escutcheon armorially marshalled. The flag of the navy (fig. 25) has three horizontal stripes, red, yellow, and red, the middle stripe being broader, and charged in the end next the staff with a circular shield ensigned with a crown and containing the impaled arms of Castile and Leon. The merchant flag (fig. 26) is yellow, with two horizontal bars of red across it.

**Portugal.**—The standard is red, charged with the Portuguese arms and crown. The flag of the navy (fig. 27) is of blue and white, divided vertically and similarly charged. The mercantile flag is the same.

**Belgium.**—The standard is striped vertically black, yellow, and red, the yellow stripe charged with the royal achievement. The mercantile flag (fig. 28) is like the standard, but without the achievement.

**Netherlands.**—The standard is striped horizontally red, white, and blue, with the royal achievement on the white stripe. The naval and merchant flag (fig. 29) have the same three stripes, without the achievement.

**Denmark.**—The flag (probably the oldest in existence, dating from the 13th century) is red, with a white cross. In the standard the cross widens into a square in the centre, in which are the royal arms surrounded by the collars of the Elephant and the Dannebrog. Both the standard and the man-of-war's flag (fig. 30) are swallow-tailed. The merchant flag is like the ensign, but rectangular.

**Sweden and Norway.**—The flag of Sweden being blue with a yellow cross, that of Norway red with a blue cross and white fimbriation, the two were combined in 1817 into one device, somewhat after the manner of the union flag of Britain. The ensign (fig. 31) is the above-described flag of Sweden (blue with a yellow cross), with the union device in the upper quarter next the flag-staff. The standard has the royal achievement in the centre of the Norwegian cross. Both standard and naval ensign are three-pointed; the mercantile flag differs from the latter in being rectangular.

**Turkey.**—The flag of the navy (fig. 32) is red, charged with a crescent moon and an eight-pointed star, both white. The merchant flag (fig. 33) is green, with a red circle in the centre, on which is a white crescent moon.

**Greece.**—The standard is blue, charged with a white cross, whose inner limb is shorter than its outer, the royal arms, supporters, &c. being in the centre. The flag of the navy (fig. 34) has nine horizontal stripes alternately blue and white, the upper quarter next the staff being blue, with a

white cross, in whose centre is a crown. The merchant flag is the same without the crown.

**United States.**—The stars and stripes of the United States of America (fig. 33) are said to have been suggested by the coat armorial of the Washington family (argent, three bars gules, in chief three mullets of the second), but it is hardly possible to reconcile this supposition with the actual history of the American flag. The earliest flag consisted of horizontal stripes, with the earlier British union device in the place which it occupies in the British ensign. Soon after the Declaration of Independence congress resolved that the flag of the United States should have thirteen stripes, alternately red and white, and that the British union device should be superseded by a blue field with thirteen white stars, the number both of stripes and of stars being correspondent to the number of states. In 1808 it was enacted that the stripes should continue to be thirteen, that the stars should be twenty in number, there being then twenty states, and that a star should be added for every new state that came into the union. In 1889, owing to the admission of four new states, the number of stars was increased to forty-two. The flag of the American admiral has the stripes alone, and the stars are used separately as a jack.

By a general international understanding, a flag of truce is white, and it is usual to hoist with it the national flag of the enemy, the white flag at the main, and the enemy's ensign at the fore. Striking the flag denotes surrender, and the placing the flag of one country over that of another indicates the victory of the former. The ensign and pendant at half-mast indicate mourning, the red flag mutiny, the black flag a pirate, and the yellow flag quarantine.

For the use of flags as signals, which has of late years been brought to great perfection, see SIGNALING.

Naval flags are now made of a light woollen fabric called bunting. Their size is expressed by the number of breadths of which they are composed, the regulation bunting being 9 inches wide.

**Flag-captain**, in the Navy, is the captain of the admiral's ship in any squadron, and is ordinarily his nominee.

**Flagellants**, the name applied to those groups of fanatical enthusiasts who, at intervals from the 13th to the 16th century, made their appearance in various countries of Europe, proclaiming the wrath of God against the corruption of the times, inviting sinners to atone for sin by self-inflicted scourgings or flagellations, and publicly enforcing this exhortation by voluntarily scourging themselves, as well as by other forms of self-castigation. In large and disorderly bands—frequently headed by priests, and by fanatics in the costume of priests and monks, bearing banners and crucifixes aloft, their breasts and shoulders bare, and their faces concealed by a hood or mask, each armed with a heavy knotted scourge, loaded with lead or iron—they marched from town to town, chanting hymns full of denunciations of vengeance and of woe. In the most public place of each town which they entered they threw themselves upon the earth, and there inflicted upon themselves the discipline of scourging, frequently to blood, and even to mutilation. Each member enrolled himself for thirty-three days, in honour of the thirty-three years of the life of our Lord on earth; and all for the time professed entire poverty, subsisting only on alms or voluntary offerings. These fanatical movements recurred at frequent intervals; the most remarkable, however, are three in number. The first originated at Perugia in 1260, at a time when society in Italy was greatly

disorganised by the long-continued struggles of the Guelph and Ghibelline factions. Numbers crowded to follow the new cry, until at last the body became so formidable as to draw upon itself the suspicions of Manfred, the son of Frederick II., by whom it was vigorously suppressed. Later offshoots of the party made their appearance in Bavaria, Austria, Moravia, Bohemia, Poland, and France; when to their extravagant practices they added still greater extravagances of doctrine. In virtue of a pretended revelation, they asserted that the blood shed in self-flagellation had a share with the blood of our Lord in atoning for sin; they mutually confessed and absolved one another, and declared their voluntary penances to be a substitute for all the sacraments of the church, and for all the ministrations of the clergy. The Jews were to them an object of special abhorrence, and suffered dreadfully from their fury in many towns of Germany and the Netherlands. In the second outbreak of Flagellantism, about 1349, the outrages against public decency were much more flagrant than on its first appearance. Men and women indiscriminately now appeared in public half naked, and ostentatiously underwent these self-inflicted scourgings. The immediate occasion of this new outbreak of fanaticism was the terror which pervaded society during the dreadful plague known as the Black Death. The same extravagances were again repeated in Upper Germany, the provinces of the Rhine, the Netherlands, Switzerland, Sweden, and even England. Although rigorously excluded from France, these fanatics effected an entrance into Avignon, then the residence of the popes, but were condemned by a bull of Clement VI. The mania gradually subsided, nor do we again find any permanent trace of it till the beginning of the next century. In the year 1414 a new troop of Flagellants, locally called *Flegler*, made their appearance in Thuringia and Lower Saxony, renewing and even exaggerating the wildest extravagances of their predecessors. These new fanatics appear to have rejected all the received religious usages, and indeed all external worship, placing their entire reliance on 'faith and flagellation.' Their leader was called Conrad Schmidt. They rejected not only the doctrines of the church upon the sacraments, but also purgatory and prayers for the dead. Their violence drew upon them the severest punishments of the Inquisition. Many of them were capitally condemned, and Schmidt himself was burned at Sangerhausen in 1414. Their doctrines, comprised in fifty articles, were condemned in the Council of Constance.

These strange extravagances are reprobated by the Roman Catholic Church in common with all other Christian communities; but Roman Catholics (relying on 1 Cor. ix. 27; Col. iii. 5) hold the lawfulness, and even the meritorious character, of voluntary self-chastisement, if undertaken with due dispositions, practised without ostentation or fanaticism, and animated by a lively faith and a firm hope in the merits of Christ. This is the self-castigation known under the name of 'the Discipline'—a form of mortification not unfrequent in the monastic state, and even practised by lay persons, and these sometimes of the highest rank, both in ancient and in modern times. See PENANCE.

See Wadding's *Annales Minorum Fratrum*; Raynaldi's *Continuation of Baronius*; Mosheim's *Church History*; Gieseler's *Kirchengeschichte*; and Milman's *Latin Christianity*. Also the following special treatises: Fürstmann, *Die Christlichen Geistesergesellschaften* (1828); Schneegans, *Die Geisler* (1840); W. M. Cooper, *Flagellation and the Flagellants* (new ed. 1887); and Rohricht in the *Zeitschrift für Kirchengeschichte* for 1877.

**Flagellum**, a vibratile filament of living matter associated with a cell, whether that be an isolated unit as in most flagellate Infusorians, or an

element in a multicellular organism, as in the flagellate chambers of a sponge. A flagellate cell has in most cases a single flagellum, and two are not uncommon; cilia, however, usually occur in numbers. A cilium is simply bent and straightened again; a flagellum wriggles from side to side with a more complex undulatory contraction and extension. A rudder-like flagellum, driving the cell before it, as in spermatozoa and bacteria, has been called a *pulsellum*; while the commoner type, which draws the cell after it, as seen in many Infusorians, has been termed a *tractellum*. A flagellum is usually locomotor or food-wafting in function, and is an expression and outcome of marked activity in the cell to which it belongs. See CELL, CILIA, PROTOZOA.

**Flageolet** (Old Fr. *flajol*), the modern form of the old *Flute à bec*, or straight flute, the simplest kind of which is the tin whistle with six holes. It is said to have been invented by Sieur Juvigny in 1580. The English flageolet has the same scale as the Flute (q.v.). The French flageolet, which at one time was very popular in dance music, is a smaller variety, having only four holes in front, with two behind for the thumbs, and additional keys. Its compass is a little over two octaves from G on the treble staff. The flageolet is not used in orchestral music.

**Flag-lieutenant** is an officer who, in the navy, performs such duties for an admiral as would devolve upon an aide-de-camp in the army. He communicates the admiral's orders to the various ships, either personally or by signal.

**Flag-officer**, in the British Navy, is an admiral, vice-admiral, or rear-admiral. He is so called from his right to carry, at the mast-head of the ship in which he sails, a flag denoting his rank. The Lord High Admiral, or the commissioners appointed to fulfil his duty—i.e. the Lords of the Admiralty, fly the union flag at the main. For an admiral the flag is borne at the main; for a vice-admiral, at the fore; and for a rear-admiral, at the mizzen: the flag being, in either case, a red St George's cross on a white field. For the former division by squadrons, see FLAG.

**Flagship**, the ship in a fleet which bears the admiral's flag, and therefore forms a sort of centre to which all other vessels must look for orders. It is usually the most powerful vessel in the fleet.

**Flagstone**, a rock which splits into tabular masses, or flags of various size and thickness, in the original planes of stratification. Flagstones are generally sandstones combined with more or less argillaceous or calcareous matter; some, however, are indurated clays, and others thin-bedded limestones. They are used for paving, cisterns, &c. The most famous are those of Festiniog (North Wales), remarkable for their large size, even grain, and great beauty; those of Yorkshire, also of large size, and of great hardness and toughness; and those of Caithness, which are extremely tough and durable. The Caithness flags belong to the Old Red Sandstone; the Yorkshire are taken from the millstone grit division of the carboniferous system.

**Flahault de la Billarderie**, AUGUSTE CHARLES JOSEPH, COMTE DE, a French soldier and diplomatist, was born at Paris on 21st April 1785. Entering the army a mere lad, he was rapidly promoted to the rank of aide-de-camp of Napoleon. He distinguished himself in the Peninsular war and the Russian campaign, and in 1813 received the title of Count, and the rank of general of division in the new army. He became an exile after Waterloo; and while in England married a Scottish peeress, the Baroness Keith and Nairne, proprietor of Tulliallan, in Clackmannan-

shire. After the revolution of 1830 Flahault returned to France, entered the household of the king, and was appointed ambassador at Vienna (1842-48). By Napoleon III. he was sent as ambassador to London (1860-62), and made Grand Chancellor of the Legion of Honour. He died 2d September 1870.

**Flail.** See THRASHING.

**Flambard**, RANULF or RALPH, justiciar of England under William II., was a Norman of obscure birth. Although he entered the church, and in 1099 obtained the bishopric of Durham, he did not scruple to make himself the king's man, ministering to his vices and extravagances by cruel and oppressive extortion of the king's subjects. He it was who taught the king to apply the usages of feudalism to the estates belonging to the church. He died 5th September 1128.

**Flamborough Head**, a promontory of the Yorkshire coast, forming the northern horn of Bridlington Bay, 18 miles S.E. of Scarborough (by road 21). It terminates a range of steep chalk cliffs, 300 to 400 feet high. Its rugged sides are pierced with many caverns, and in the sea close by are picturesque chalk rocks, which swarm with sea-birds. On the Head is a lighthouse, 214 feet above sea-level, and 80 feet high, seen 21 miles off. Across the peninsula, ending in the Head, runs a double entrenchment called Danes' Dyke, but really an ancient British earthwork.

**Flamboyant**, the latest style of Gothic architecture, which prevailed in France during the 15th and part of the 16th centuries, and corresponds to the Perpendicular (q.v.) in England. The name is derived from the flame-like forms of the tracery of the windows, panels, &c. (fig. 1). The characteristics of this style are minute and elaborate ornament, combined with general bareness of surface. The crockets, for instance, are generally cut into a great number of small leaves, while they are placed far apart; the mouldings are divided into large empty hollows and small thin fillets and beads; the finials have crockets minutely carved, set upon bare pyramidal terminals; the arch-mouldings are divided into a great number of small members, and want the boldness and decision of the earlier styles. These mouldings are frequently abutted on the pillars, or continued down them without any caps; and when there are caps, they are small and without effect (see fig. 2). When mouldings join, they are frequently run through one another, so as to appear to interlace. The effect is intricate rather than beautiful, suggestive, like the rest of the style, of ingenuity in stone-cutting rather than art. The doorways and windows are sometimes large and fine (as in fig. 1); but, while these are highly enriched, the general surface of the building is left too plain. The foliage and running enrichments are

Fig. 1.—Window, Harfleur.

frequently carved with great spirit. There are many large buildings in France executed in this style, but it is usually portions only which are fine, not the general effect. Some of the spires of this period are also very beautiful. The north-western spire of Chartres (q.v.) Cathedral, for example, is considered one of the finest in France.

Fig. 2.

**Flame** consists of gaseous matter undergoing combustion. In this process heat is given out as the result of the chemical combinations effected, and also, generally, light from the incandescence of some of the substances undergoing combustion.

When the gas and the supporter of its combustion (i.e. the substance with which it combines in burning), which is usually oxygen or atmospheric air, are thoroughly mixed together, and when any part of it is raised, as by the application of a light, to the temperature of ignition, combination is effected with great rapidity throughout the mass of the gas, and a flame of no particular shape or form is produced. But if the combustible gas issues from a jet or orifice and is burned there, the flame assumes a definite shape, and exhibits certain more or less well-defined parts. The flame of such a substance as coal-gas issuing from a jet consists of three parts:

Flame of a Candle: Showing 1, area of non-combustion; 2, area of partial combustion; 3, area of complete combustion.

(1) An inner dark space filled with the gas alone, and in which no combustion takes place; it may be termed the *area of non-combustion*, and that it is of this nature may be proved by inserting into it a small piece of phosphorus, when it will be found that the phosphorus does not take fire, as it would were it placed in any other part of the flame. (2) A luminous envelope, completely surrounding the dark inner part except at the jet, and consisting of the combustible gas mixed with oxygen and atmospheric air.

Into this part of the flame the oxygen of the air penetrates and effects combustion; but, as it is not present in sufficient quantity to completely burn all the constituents of the gas, part of the carbon is separated; this portion of the flame is therefore termed the *area of partial combustion*. (3) An outer portion in which the separated carbon particles are raised to incandescence and completely burned, as also are any other products the combustion of which has not been completely effected in the area of partial combustion; hence this is known as the *area of complete combustion*.

The colour of a flame depends partly on its temperature, but principally on the nature of the substances undergoing combustion or incandescence. The luminosity of flames varies also with the nature of the gas; it is due to the incandescence of carbon particles, and also of dense hydrocarbons present. Feebly luminous flames, such as those of hydrogen, can be increased in luminosity by the admixture with the combustible gas of such substances as benzole vapour; also by an increase in pressure of the agent supporting the process of

combustion, or by heating the gas before it enters the flame. Of 100 units of light emitted by a gas flame burning under an atmospheric pressure of 30 inches of mercury, 5.1 units are lost by each reduction in pressure of 1 inch.

**Singing and Sensitive Flames.**—If the flame of coal-gas or, better still, hydrogen issuing from a blowpipe nozzle be slowly passed up a wide glass tube, it will be found that at a particular position up the tube the flame alters its character; being rapidly extinguished and rekindled, while at the same time it gives forth a peculiar musical note. To this is given the name of a *singing flame*. The sound is caused by longitudinal vibrations of the air in the tube, originally set up by a decrease in pressure above the flame, caused by the upward draught; a downflow is thus momentarily produced, which in its turn is checked by the upward motion of the air; and so on.

When an inflammable gas issues from a narrow vertical jet, and is ignited above a sheet of wire-gauze held horizontally about two inches above the orifice, a flame is produced which is easily affected by any sound-waves which strike it, and is hence termed a *sensitive flame*. Such a flame will respond to sounds, especially those of high pitch, produced in its neighbourhood, by sinking down to the wire-gauze. A flame which is highly sensitive and responsive to sounds too acute to be perceived by the human ear can be made by igniting gas issuing under great pressure from an exceedingly narrow jet.

**Flamens** were priests in ancient Rome devoted each to some special deity. There were fifteen in all. The chief of these (*Flamines Majores*) were the flamen of Jupiter (*Flamen Dialis*), of Mars (*Martialis*), and of Quirinus (*Quirinalis*), who were always patricians; the remaining twelve (*Flamines Minores*) were chosen from the plebeians. The flamens were elected at first by the Comitia Curiata, but afterwards by the Comitia Tributa, and were installed into their office by the supreme dignitary of the Roman official religion, the pontifex maximus. The flamen of Jupiter was a privileged person; he was not required to take an oath, was attended by a lictor, his house was an asylum, and he had a seat in the senate. But all this was attended by numerous restrictions: he might not have a knot on any part of his attire, nor touch flour, or leaven, or leavened bread; he might not touch or name a dog, or mount a horse, or be a night out of the city, &c. His wife, called Flaminica, was subjected to similar restrictions, and when she died the flamen was obliged to resign. The majority of Roman writers attribute the institution of flamens to Numa.

**Flamingo** (*Phenicopterus*), a genus of remarkable birds, usually regarded as forming a distinct family, Phenicopteridae, near the Anseres or ducks and geese, considered by Huxley as 'completely intermediate between the Anserine birds on the one side and the storks and herons on the other.' The genus includes eight species, four of which are American (in Chili, Galapagos, Mexico, West Indies), while the others are distributed in Africa, South Europe, India, and Ceylon. The bill is very peculiar, longer than the small head, and suddenly bent downwards in the middle; the neck is very long and thin; the same adjectives are even more applicable to the legs; the short toes are webbed. The flamingoes live sociably on marshy shores, usually of the sea, but sometimes of fresh water. They wade in the water, stirring up the bottom with restless feet, and grub for small animals. In thus fishing, the neck is bent upon itself so that the upper half of the spoon-like bill is turned downwards. The edges of both upper and lower jaw are

furnished with small transverse plates, which serve, as in common Aseres, for a sieve, allowing the escape of the mud, but retaining the small worms, crustaceans, molluscs, fishes, &c., on which the birds feed. The upper surface of the tongue is beset on the sides and base with flexible, recurved, horny spines.

Flamingo (*Phenicopterus ruber*).

The flamingoes are birds of powerful flight, and fly like geese in strings or wedge-shaped flocks. They also swim in deep water, but the legs are too long to be well adapted for this purpose. They are habitual waders, and the webbed membrane of the feet helps to support them on soft muddy bottoms. Hundreds feed and nest together, and, being large and richly coloured, form a brilliant assembly, their exquisite pink plumage sometimes making a striking contrast against a background of dark-green mangroves. The nests are mounds of mud, from 8 to 15 inches in height, gradually raised year after year, and built at distances of 3 to 4 feet apart. During incubation the females, according to some, sit with their legs dangling down behind; but Mr Blake, who watched them carefully, says that the limbs are folded under the birds in the usual fashion. The nesting occurs about the end of May, the hatching about a month later. There is usually only one egg. One species (*Ph. ruber* or *antiquorum*) occurs in Europe, from spring to autumn, on Mediterranean coasts, and within the century as far north as the Rhine. It measures about four feet from bill to tail, and stands about six feet high from bill to feet. The male in full plumage is for the most part of a rose-red colour; the female, and the young for several years, are less brilliant. The young birds were among the delicacies of the ancients. See II. A. Blake, 'Flamingoes at Home,' *Nineteenth Century* (December 1887, pp. 886-890).

**Flaminian Way** (*Via Flaminia*), the great northern road of ancient Italy, leading from Rome to Ariminum (*Rimini*) on the Adriatic. It was constructed by C. Flaminius during his censorship (220 B.C.) in order to secure a free communication with the recently conquered Gaulish territory, and was one of the most celebrated and most frequented roads of Italy both during the period of the Republic and of the Empire. Its importance may be estimated from the fact that, when Augustus (27 B.C.) appointed persons of consular dignity road-surveyors for the other highways of his dominions, he reserved the care of the Flaminian Way for himself, and renewed it throughout its whole length.

**Flammarion**, CAMILLE, French astronomer, was born in 1842 at Montigny-le-Roi, entered the Paris Observatory in 1858, and shortly afterwards made a reputation by his popular lectures on astronomy. The titles of his principal books will sufficiently indicate the line of his activity: *The Plurality of Inhabited Worlds* (1862; 30th ed. 1884); *Imaginary Worlds and Real Worlds* (1864; 19th ed. 1884); *God in Nature* (1866; 18th ed. 1882); *Celestial Marvels* (1865; Eng. trans. 1870); *Studies and Lectures on Astronomy* (1866-81; 9 vols.); *History of the Heavens* (1872); *The Atmosphere* (1872; Eng. trans. 1873); *The Stars and the Curiousities of the Heavens* (1881); *The Lands (Terres) of the Heavens* (8th ed. 1882). In 1868 Flammarion took considerable interest in ballooning, made several ascents, and wrote a work entitled *Travels in the Air* (Eng. trans. by James Glaisher, 1871).

**Flamsteed**, JOHN, the first astronomer-royal of England, for whose use the Royal Observatory at Greenwich was built, was born near Derby in 1646. He early devoted himself to mathematics and astronomy with such success as to attract the notice of Sir Jonas Moore, and through him he was appointed astronomer to the king in 1675, in which capacity he endured the unhappy conjunction of too much work and too little pay. The year after, the Observatory at Greenwich was built, and Flamsteed began the series of observations that really commenced modern practical astronomy. He formed the first trustworthy catalogue of the fixed stars, and furnished those lunar observations on which Newton depended for the verification of his lunar theory. Extracts from the papers of Flamsteed, found in the Observatory by Francis Baily, and published by authority of the Admiralty in 1835, brought to light a very sharp quarrel that had taken place between Flamsteed and Newton and Halley with regard to the publication of the results of Flamsteed's labours. His great work is his *Historia Caelestis Britannica*, an account of the methods and results of astronomical observation up to his time, published in 3 vols. in 1723. Flamsteed, while following his scientific pursuits, took holy orders, and in 1684 was presented to the living of Bustow, in Surrey, which he held till his death on 31st December 1719. See Baily's *Account of Flamsteed* (1835).

**Flanders** (Flemish *Vlaanderen*), the country of the Flemings, a territory lying adjacent to the North Sea, between the Scheldt and the Somme, which embraced the present Belgian provinces of East and West Flanders, the southern portion of Zealand in Holland, and the greater part of ancient Artois in France. This region was originally inhabited by Belgic tribes, on whose subjection by one of Caesar's lieutenants their territory was incorporated in Roman Gaul. Under the supremacy of Rome they attained to a certain degree of civilisation, being renowned for their agriculture, their industry, and their commerce. The region was afterwards overrun by the Franks on their way to Gaul, many of them settling there permanently. By the Treaty of Verdun (843) Flanders was assigned to Neustria. The real nucleus of Flanders as a political state was the patrimony of a noble family whose possessions were grouped around Bruges and Sluys. In 862 the king of France, as suzerain, changed the title of the head of the family from forester or ranger to count. The first recipient of the honour was Baldwin I., Iron-arm (877-877), who was likewise invested with the maritime region of north-east France, on condition that he defended it against the Normans. His descendant, Baldwin IV. (989-1036), having seized upon the emperor's town of Valenciennes in 1006, and proving himself able to keep what he had

taken, was allowed to retain it (1007) as a feudatory of the empire. At the same time the emperor invested him with Ghent and the Zealand islands (Walcheren, Beverland, &c.). Thus the Count of Flanders held of the emperor as well as of the king of France. Under this count's son and successor, Baldwin V. (1036-67), the county of Alost (Aalst), Tournai, and Hainault were added to the principality. On his death the Netherlands portion of Flanders was erected into an appanage for his younger son, Robert the Frisian, who on the death of his elder brother, Baldwin VI. (1067-70), also wrested Flanders from Baldwin's widow Richilde, leaving to her and her son Hainault only. From this time down to the end of the 12th century the Flemish territories remained thus divided. The counts of Flanders of the 10th and 11th centuries were active in promoting the well-being of their people; they built churches and monasteries, and encouraged the industries of the towns, whereby Flanders rose to be the chief centre of woollen-weaving and fulling in Europe. At this period Ghent, Arras (the capital of the county), Courtrai, Rousselaere, Valenciennes, Cassel, Tournai, Lille, St Omer, Ypres, and Bruges were prosperous cities, the centres of the intelligence and public spirit of the country. Robert II. (1093-1111), son of Robert the Frisian, distinguished himself in the first crusade. His son, Baldwin VII. (1111-19), rigorously suppressed the private feuds of his nobles, and administered justice with Draconian severity. As he left no heir, the county was held by a succession of alien princes, as Charles of Denmark (1119-21); William, son of Robert of Normandy, till 1129; Thierry (Diedrich) of Alsace (1129-69), who took part in more than one crusade; and Thierry's son Philip (1169-91), who, besides championing the Christian faith against the Saracens, did much to foster industry and trade at home.

The accession of these foreign princes was turned to account by the Flemish cities, which extorted from them important charters of liberty and self-government. On Philip's death, Baldwin of Hainault reunited the two Flemish counties under one sceptre. But he had a rival for Flanders proper in Philip of France, who, having married Baldwin's own daughter, the niece of Philip of Flanders, claimed this district as her dowry; and Baldwin was constrained to buy off his more powerful antagonist by the cession of the county of Artois, a large part of southern Flanders, and the towns of St Omer, Hesdin, and some others. From this time forth Ghent superseded Arras as the capital. The next prince of Flanders was Baldwin IX. (1194-1206), son of Baldwin of Hainault, who, after winning back from France most of southern Flanders (though not Artois), took the crusader's cross and became the founder of the Latin empire of Constantinople. Baldwin was followed successively by his two daughters, Johanna (1206-43) and Margaret (1243-78), and by Margaret's son, Guy of Dampierre (1278-1305), who spent a large part of his life as a prisoner in France. Under these rulers the king of France first began to exercise a determining influence upon the government of Flanders. In 1256 the Zealand islands were given to the Count of Holland, and to Holland they have ever since belonged. The next century presents a series of disputed successions, mostly fomented by the kings of France, who made strenuous efforts to unite Flanders to the French crown. The country was in fact divided between two streams of preponderating influence: on the one hand the nobles, headed by the counts, were enamoured of France, and French society, and French institutions (*Leliarts*); and on the other the burghers of the towns (*Claeuwaerts*) clung tenaciously to their national independence and municipal freedom. It was the latter party that con-

stituted the backbone and strength of the country. From the middle of the 12th century the cities, growing more independent and more turbulent with the increase of wealth, began to play an increasingly important part in the politics of Flanders, warring one against another, and even waging civil strife within their own walls, taking up arms against their counts, and by their factions either consolidating or marrying the fortunes of the rulers of the country. It was especially under Johanna and Margaret that the burghers of such cities as Bruges, Ypres, Ghent, and Lille made rapid progress in commercial prosperity and in the establishment of democratic principles of local government. Each of these cities possessed nearly 40,000 looms for weaving cloth; whilst Damme was a thriving seaport, doing a large shipping trade in wool, corn, cattle, wine, beer, &c. The struggle of the cities, represented chiefly by Bruges, Ghent, and Ypres, against the counts and other rulers, lasted more or less down to the Treaty of Utrecht (1713).

Philip IV. of France, having for some years steadily fanned the dissension in Flanders, at length got Count Guy into his hands and took possession of his country (1300), which he governed by means of a regent, Châtillon. This man's oppressive rule, however, provoked a general revolt of the Flemings, who in the battle of the Golden Spurs, fought near Courtrai on 11th July 1302, almost destroyed the army sent against them by the king of France. The contest continued until 1320, during all which time the Flemings successfully repelled the attempts of Philip to invade their country; and at last wholly shook off the claims of France. Under Louis, who became Count of Flanders in 1322, and who neglected his country to spend most of his time at the court of France, the cities frequently broke out into open revolt; Bruges even held Louis a prisoner for several months, nor were the rebels quelled except with the aid of a large French army (1328). In 1336 Jacob van Artevelde (q.v.), who had acquired supreme influence and power in Ghent, induced the chief cities, in defiance of their count, to make an alliance with Edward III. of England to help him in his quarrel with France. From this time down to 1345, when he was slain by a rival in Ghent, Van Artevelde was the real ruler of Flanders, though he found it an impossible task wholly to restrain the violence and disorder in the restless cities. Under Louis II., who succeeded his father, Louis I., in 1346, it was Ghent and Ypres that at first refused to submit to his rule. Then, in 1379, the keen rivalry of Ghent and Bruges came to a head in a civil war, which soon swelled into a general uprising of the entire country, led by the Ghent faction of the White Caps, against the count. The people of Ghent held out stubbornly under Philip van Artevelde, who, however, was slain in battle against the French, 27th November 1382, at Roosbeke. Two years later Count Louis III. died, leaving an only daughter, married to Philip of Burgundy (q.v.), with which duchy the history of Flanders became thenceforward intimately associated, until in 1477, by the marriage of Mary of Burgundy to Maximilian of Austria, both states passed to the empire, Flanders becoming part of Austrian Netherlands. Against this arrangement France vainly protested; and in 1526 she was compelled finally to renounce her claims as suzerain. With the accession of Philip II. to the throne of Spain the history of Flanders becomes identical with that of the Spanish Netherlands (see HOLLAND). By the Treaty of Westphalia Dutch Flanders was transferred to the United Netherlands, whilst by the treaties of the Pyrenees (1659), Nimeguen (1678), and Utrecht (1713) Louis XIV. succeeded in adding to France Artois and a large part of French Flanders. By

this last treaty and by that of Rastatt (1714) the rest of Flanders was assigned to Austria, and became known as the Austrian Netherlands. On the formation of the new kingdom of Belgium in 1831, the provinces of East and West Flanders were incorporated with it.

See Oudegherst, *Chroniques et Annales de Flandre* (1571); Warnkönig, *Fländrische Staatsgeschichte* (Tübingen, 1835-39); Conscience, *Geschiedenis van België* (1845); and the more recent works of Kervyn de Lettenhove. For the Belgian provinces of East and West Flanders, see BELGIUM; for the Flemish language, see HOLLAND; and for the Flemish School of Painting, see PAINTING.

**Flandrin**, JEAN HIPPOLYTE, historical and portrait painter, was born at Lyons, 23d May 1809, the son of a miniature-painter. After studying in his native town, he proceeded in 1829 to Paris, where he attended the School of Fine Arts. But he also worked under Ingres, who was his true master; and from him he imbibed that love of severe and definite form and that classical feeling which he used for his own ends in his religious painting. He had a severe struggle with ill-health, and endured many privations; but in 1832 he won the *Prix de Rome* by his 'Recognition of Thesens'; and before his five years' residence in Italy was completed he had produced his fine rendering of 'St Clair healing the Blind,' now in the cathedral of Nantes. Henceforward he was mainly occupied with decorative monumental work, though he also executed many admirable portraits. In 1842 he began his great frescoes of 'Christ entering Jerusalem,' and 'Christ going up to Calvary,' in the sanctuary of the church of St Germain-des-Près, Paris, deeply impressive works, which already entitled his painter to rank as the greatest religious painter of the century. The choir of the same church he adorned (1846-48) with figures of the Saints and the Virtues. He also decorated the church of St Paul at Nîmes (1847-49), the church of St Martin d'Ainay at Lyons (1855), and painted the frieze of St Vincent de Paul, in Paris, with a noble series of saints and martyrs. In 1855 he began his last great work in the nave of St Germain-des-Près, consisting of subjects from the Old and New Testaments, of which some were left uncompleted at his death, at Rome, 21st March 1864. His *Lettres et Pensées*, with a memoir and a catalogue of his works, were issued by the Count Delaborde, in 1865. See also *Lives by Poncet* (1864) and *Montrard* (1876).

**Flank** ('the side'), a word used in many senses in military matters. *Flanks of an army* are the wings, or bodies of men on the right and left extremities. *Flank files* are the soldiers marching on the extreme right and left of a company or any other body of troops. *Flank company* is the company on the right or left when a battalion is in line. *Flanking parties*, or *flankers*, are cavalry or infantry marching some distance from the sides of the main column to prevent a sudden attack upon them.—*Flank*, as applied in fortification, will be best described under that article. Generally it is any part of the works from which fire sweeps, or flanks, the front of any other part. The *flanks of a frontier* are certain salient points on it, strong by nature and art, between which an enemy dare not penetrate, at the risk of their garrisons attacking his rear, and cutting off communication between him and his base.—In manœuvring, 'to flank' is either to protect the flanks of one's own army by detached bodies of troops, or field-works, or to threaten those of the enemy by directing troops against them. To *outflank* is to succeed by manœuvres in overlapping the flank of an enemy who has been, on his part, endeavouring to flank one's own force.

**Flannan Islands**, or THE SEVEN HUNTERS, a small group of uninhabited islets off the outer Hebrides, 20 miles NW. of Gallon Head in Lewis.

**Flannel** (Welsh *gwlanen*, close to which is the provincial *flanfen*). The processes in the manufacture of flannel are similar to those employed for woollen cloth, which differs in its nature from worsted cloth. For flannel the wool, after passing through the preparatory processes of scouring and deffling, is carded, spun, woven, and filled or milled. Those kinds with a fleecy pile on the surface are passed through the teasing-machine (see WOOLLEN MANUFACTURES). Yarn for ordinary flannel is loosely spun to impart softness to the fabric. Flannel wears better and shrinks less if the pile is slightly raised than if it is much raised, and it is better to get it of the natural white colour than slightly blued, as this tint gives way at the first washing.

Welsh flannel made from the wool of the Welsh mountain-sheep fetches the highest price. But it is well known that the supply of this wool is not nearly enough to make the quantity of flannel sent into the market as 'real Welsh.' Some of the Lancashire flannels made of other wools are hardly inferior to those made in Wales. Yorkshire flannels are lower in price than either of these. Special kinds of flannel are made, such as the comparatively firmly spun and closely woven flannel for cricket dresses and fancy shirts; thin all-wool gauze flannel for use in India and other warm countries; similar flannel made with a silk warp; domettes made of wool and cotton; and gray, dyed, and printed flannels. The manufacture of flannels is chiefly carried on in England at various places in Lancashire and Yorkshire, and in Wales at Newtown, Welshpool, and Llangollen. Flannel shirtings are made on a considerable scale at Auchterarder in Scotland.

In the United States flannels are manufactured on a very extensive scale. In order to prevent shrinkage these are made of yarns more closely twisted than those used for English flannels. American flannels are also less highly filled, and smoother in the face. The French excel in the manufacture of fine dyed flannels. On the Continent, also, a substitute for flannel is made of the fibre of the leaf-needles of the Scotch Fir (see FIBROUS SUBSTANCES).

**Flat**, a musical character, shaped thus ♭, which, when placed before a note, lowers that note half a tone. The double flat, ♭♭, lowers a note two semitones. Singing or playing is called flat when the notes are at all below the right pitch.

**Flat**, a story or floor of a building, especially when fitted up as a separate residence for a family; four, six, or more such dwellings (often only half-floors) being approached by a common stair. This tenement system is much more common in Scotland and on the Continent than in England, though of late years it has been largely adopted in London, both in the richer and in the poorer districts. In New York and other large American towns, besides the older tenement houses, there are more expensive modern flats, often fitted with conveniences unknown in similar houses in Europe.

**Flatbush**, a post-village of Long Island, in a township of the same name, adjoining Prospect Park, Brooklyn, with a lunatic asylum. Pop. of township, 7634.

**Flat-fish** (*Pleuronectidae*), an important family of marine bony fishes, in the order Anacanthini, with the body compressed from side to side, and markedly unsymmetrical. The turbot (*Rhombus maximus*), the halibut (*Hippoglossus vulgaris*), the flounder, plaice, and other members of the genus *Pleuronectes*, and the soles (*Solea*) are well-known

examples, valuable as food-fishes. There are about three dozen genera and two hundred species. They occur in all seas, and some thrive in fresh water. The adults keep to the bottom, especially on sandy coasts, and come nearer shore in the spring spawning season and during summer. They are all carnivorous. Many of them alter the colour of their exposed upper side in sympathetic and automatic adjustment to the nature of the ground on which they lie concealed. They are all destitute of a swim-bladder, but the most remarkable feature is the asymmetry of the skull, eyes, and musculature. Unlike the gristly skates, which are flattened from above downwards, the *Plenoneetidae* are flattened sideways, and swim or rest on one side, either right or left. The under side is virtually uncoloured, the upper side is often markedly pigmented, and bears both the eyes. The young forms, however, are striking contrasts to the adults. They are almost transparent, occur in the open sea, are quite symmetrical, with an eye as usual on either side, and swim vertically. With increasing size the normal structure and habit are lost, the fishes become asymmetrical, and keep to the bottom. While the skull is still gristly and plastic it is twisted, and the lower eye comes to lie beside its fellow on the upper surface. The exact mechanism is not yet clear. See FISHES, FLOUNDER, PLAICE, SOLE, TURBOT, &c.

**Flatheads**, a term officially but incorrectly applied to the Selish Indians, a small tribe dwelling on Clarke's Fork, in Idaho. The men are industrious and willing to learn, and have become good farmers; preferring peace, they nevertheless make brave warriors, but have never fought against the whites. A grammar of their difficult language has been published by Mengarini (New York, 1861). The term Flatheads refers to the very ancient practice of flattening the skulls of young infants by various mechanical means, such as was prevalent in Peru, both before and after the arrival of the Incas, among the Caribs in Central America and Mexico, in Florida, and among the mound-builders of the Ohio and Mississippi valleys. Among modern Indians it is mostly confined to the Chinooks (q.v.) and other tribes of the north-west coast of North America.

**Flattery**, CAPE, a headland of Washington state, U.S., washed on the NE. by the Strait of Juan de Fuca, and on the SW. by the Pacific.

**Flatulence**, distension of the stomach or bowels by the gases formed during digestion. See INDIGESTION.

**Flaubert**, GUSTAVE, who is considered by competent judges the most remarkable French novelist of the second half of the 19th century, was born at Rouen on the 12th December 1821. He was the son of a physician of eminence, and inherited, though not wealth, a fortune sufficient to enable him to choose his own way of life. He hesitated long between his father's profession and literature; and in literature he began with poetry, which, however, he definitely gave up before long for prose. Flaubert's life was extremely uneventful in outward incident, the turning-point of it being, according to his intimate friend M. Maxime du Camp (whose account, though traversed by some of Flaubert's other friends, seems to be accurate in the main), the access when he was still a young man of some obscure form of brain-disease, which altered, and even to some extent arrested, his intellectual development. M. du Camp goes so far as to hold that almost all the original part of Flaubert's work was conceived, if not actually sketched, before this time. But however this may be, Flaubert was a very late producer, and his work, when it did appear, was marked by a very

strong and somewhat morbid idiosyncrasy. He had comparatively early (before 1849) written some fragments of a work only completed much later on the Temptation of St Anthony, but his first published book was the famous novel of *Madame Bovary*, which appeared in 1857. This is the history of a girl of some education, with strong aspirations after elegance of life and depth of passion, whose fate condemns her to live in the country as the wife of a well-intentioned but utterly stupid and commonplace doctor. Her successive lapses into vice, her desertion by each of her lovers, her extravagance, and her final suicide form the central part of a story, the outline of which is filled up by a series of the most wonderful studies of scene and character, charged with satiric melancholy, and expressed in an extraordinarily careful and vivid style. Style, indeed, was the object of Flaubert's main devotion, and as he advanced in years he for the most part shut himself up in his small country-house near Rouen to wrestle, as his own favourite phrase expressed it, with the language which was to clothe his thought. Although *Madame Bovary* is not constructed according to English ideas of decorum, its license in that respect does not exceed what had long been common in French, and the author was most indignantly surprised at its prosecution as an offence against morals, a prosecution which did not succeed. His second work, *Salammô* (1862), dealt with the last struggle of Rome and Carthage. The author had taken immense pains to study the locality and all the authorities; and he put into his book in consequence an amount of archaeological detail and local colour which sometimes seems to overweight the story. *Salammô* is moreover deeply tinged with the sombre horror which was one of Flaubert's notes.

In 1866 Flaubert was decorated with the Legion of Honour. Three years later *L'Éducation Sentimentale*, a much longer book, appeared, but was far less popular. No book of Flaubert's displays more accurate observation of life, but the absence of central interest and the disheartening effect of a mere succession of disillusionings undergone by the hero make it a book for few. In 1874 appeared the splendid phantasmagoria of *La Tentation de St-Antoine*, worked up from the early fragments already referred to, and the masterpiece of its kind; while in the same year the author produced a play, *Le Candidat*, with little success, and of no merit. In 1877 there followed his last book (exclusive of posthumous work), *Trois Contes*, which represents all his best manners; the first tale, on the daughter of Herodias, being a *Salammô* in little, *Un Cœur Simple* displaying all the power of *Madame Bovary* with a perfectly harmless subject, and *St-Julien l'Hospitalier* being in the same vein as the *Tentation*, with the addition of something like a central thread of interest. Flaubert died on May 9, 1880, and after his death appeared a novel, *Bourvard et Péuquet*, which had not received his final revision, and which is somewhat undigested. It tells of the attempts of two retired men of the middle class to interest themselves in literary and scientific researches. There has been published (also posthumously) an extremely interesting correspondence with George Sand; and other letters throwing much light on Flaubert's character have followed. In his last years he was a member of a small set of distinguished writers (the other three being the great Russian novelist Turgenieff, M. Daudet, and M. Zola), who frequently met, and who acquired the reputation as of a sort of headquarters-staff of what has been successively called realism and naturalism in fiction. Flaubert, however, never belonged to either of these schools, least of all to

that of naturalism. His minute and exhaustive description was indeed a point in common with both; but this description was always subordinated to a strictly romantic conception of the general scheme of story-telling. Flaubert was in fact a pure romanticist who came late and had engrafted on the earlier romanticism not a few characteristics rather inherited than borrowed from Balzac on the one hand, and Stendhal on the other. It is improbable that any more remarkable examples of this combined mode will ever be created than *Madame Bovary* and *Salammô*, each in its kind, though from the mere fact of the combination it follows that some readers will fix their attention most on the realism, others on the romance. A splendid 'édition définitive' of Flaubert's works was issued in 8 vols. (1885).

**Flavel, JOHN**, an English Nonconformist divine, born at Bromsgrove in Worcestershire, most probably in 1630, was educated at University College, Oxford, took Presbyterian orders in 1650, and had already held livings at Diptford (in Devon) and Dartmouth, when he was ejected by the Act of Uniformity of 1662. He continued to preach privately at Dartmouth, and after the Declaration of Indulgence (1687) was minister of a Nonconformist church there till his death at Exeter, 26th June 1691. He was four times married. His writings were long popular, and do not entirely deserve the neglect into which they have fallen. His best books are the *Treatise on the Soul of Man*, *The Method of Grace*, *A Token for Mourners*, and *Husbandry Spiritualised*. An edition in 6 vols. was issued in 1820.

**Flavian Cæsars** were Vespasian (q.v.), Titus Flavius Vespasianus and his sons and successors, Titus and Domitian.

**Flavine**, a concentrated preparation of quercitron bark imported from America. Until recently it was an important yellow dye, but cheaper colouring materials are now being substituted for it. See DYEING.

**Flax** (*Linum*), the typical genus of Linaceæ, a sub-order of Geraniaceæ, consisting of about 140 species of annual and perennial herbaceous plants, with a few small shrubs, all inhabitants of temperate climates, most abundant in Europe and northern Africa. Some are cultivated as showy

Common Flax (*Linum usitatissimum*).

garden annuals—e.g. *Linum grandiflorum*, &c., while the allied *Radiola millegrana* (Allseed) is the smallest of our phanerogamic weeds. *L. catharticum*, an annual weed, is the Purging Flax, long a standard resource of domestic medicine. But

all essential interests centre round the Common Lint or Flax, well named by Linæus *L. usitatissimum*, since in its importance for civilised man it rivals the staple food plants. There are two main varieties or sub-species—*vulgare* and *crepitans*, the latter distinguished by its shorter and more branched stems and rather larger leaves, but more easily by its larger capsules, which burst open when ripe with a characteristic sound, so scattering the seed. Though shorter, this yields the finer, softer, and whiter fibre. In both the flower is a loose corymb of beautiful blue flowers. *L. austriacum* is also cultivated in France, *L. maritimum* in southern Europe, and *L. Levisi* in North America, but all yield a coarser fibre. The flax of prehistoric times found in the Swiss pile-dwellings, and in the remains of the stone age in northern Italy, was derived from *L. angustifolium*, as not only the manufactured product but the actual remains of the stems, fruit, and seeds clearly show. The common lint of the Aryan peoples was, however, *L. usitatissimum*, and the occurrence of the name lint with little modification in all European languages is usually interpreted as indicating that its use dates from the remote antiquity of their common home. The same culture is shown by an examination of the mummy-cloths of Egypt, which are always of linen; and the species is also recognisably delineated upon the walls of the tombs.

The quantity of flax produced in Great Britain, once large, has steadily decreased, and is now quite inconsiderable; but the flax grown in Ireland is still an important crop. While in Scotland and England the total area under flax was in 1888 but 2208 acres, in Ireland there were in that year 113,586 (as against 108,147 in 1885, and 95,935 in 1883). The crop of Ireland produced 3,937,259 tons of flax in 1883, and 4,136,095 in 1885. But by far the most important producing country is Russia, which mainly supplies the manufactures of Britain, as well as in large measure those of Germany. The acreage in flax in Russia in 1881–85 was above 1,950,000 acres; Germany had about 260,000 acres; France only 126,000. In the United States flax was grown as early as 1626; bounties for its production in Virginia were given in the middle of the 17th century, and the British parliament made grants to the patentees of Georgia in the middle of the 18th century. Manufactories of sailcloth were established at Salem and Springfield in 1790. In 1880 the American crop of flax produced 7,170,951 bushels of seed, and 1,565,546 lb. of fibre.

For an account of the mode of preparation of its bast as a textile fibre, see below; for processes of manufacture, see LINEN; and for a description of the useful applications of its seed, see LINSEED, OILCAKE, OIL.

**FLAX-DRESSING.**—Growing stems of flax are not cut by scythe or reaping-machine, but pulled up by the roots. The best time for doing this is when the stalks begin to turn yellow at the base, and the seeds begin to change from green to a pale brown. A heavier crop is obtained when the plant is riper, but the quality of the fibre is injured. It is of importance that the stems of equal length should be separated, uniformly in this respect simplifying the dressing processes.

**Rippling**, the process of removing the seeds, follows the harvesting. The ripple, or rippling-comb, consists of a row of round iron teeth set in a wooden frame which is fixed to a plank. In length the teeth are about 18 inches, and at the pointed tops they are about half an inch apart. The rippler, taking up a bundle of flax, spreads out the tops like a fan, and generally draws first the one half of it and then the other through the teeth, a sheet being placed on the ground to receive the seeds or bolls as they fall. One or two machines

have been introduced for rippling flax. One of these removes the seeds by passing the stems between two cast-iron cylinders. Another performs the operation by means of beaters which loosen the seeds, and shakers which then shake them out of the bundles of flax-straw.

**Retting** is the name given to the next process in the treatment of the stems of flax. Its object is to facilitate the separation of the useful fibre from the boon or woody part of the stem through the removal, by fermentation, of the gummy or resinous matters present in the plant. This is done either by dew-retting or by water-retting with or without the aid of heat. Dew-retting consists in spreading the flax on the grass, and exposing it to the influence of dew, rain, air, and light for a considerable time. It is a method practised in Russia, and produces a soft and silky fibre. Water-retting or steeping is the plan most generally followed. Soft water is essential, and the dam or pond should not be more than four feet deep. In this the flax bundles or 'beets' are placed in rows, roots downwards, and then covered with weeds or straw weighted with boards and stones, or with turf and stones, to keep the flax below the water. If the weather is warm fermentation begins soon, a change which causes the flax to rise in the water, and it must then be more heavily weighted. The flax sinks again as the fermentation slackens, the extra weight being then removed. Great judgment is required to determine when the retting has proceeded far enough. The stems are examined with much care, and if one finds on breaking them at one or two places, or twisting them in the middle in opposite directions, that the woody core called 'shore' or 'slive' separates freely from the fibre, the flax is ready for removal from the pond. From ten to fourteen days are required for the process with water at ordinary temperatures. The smell that accompanies the process is most offensive, and water in which flax has been steeped is valuable as a liquid manure.

A quicker process of retting, in which water at a temperature of 75° to 90° F. is used, was introduced by an American, R. B. Schenck, in 1847. Wooden vats are employed, and the fermentation goes on so much more rapidly that the time of steeping is reduced to from 50 to 60 hours. By another invention (Pownall's) the flax is passed between heavy rollers after it is taken from the vats, clean water being kept flowing over the stems during the operation to remove the gummy matters. Schenck's method is not much favoured now.

**Grassing** follows the ordinary retting process. The flax stems are spread in rows of thin layers upon short grass for a few days, during which time they are sometimes turned with a pole; but if this is not done, the tips of the stems of one row should overlap the root ends of the next. The flax is lifted when it is found that a slight rubbing suffices to separate the woody core from the fibre.

**Breaking.**—After the retted stems are dried they undergo 'breaking' to prepare them for the scutching process. One simple and efficient machine for breaking consists of two pairs of horizontal fluted rollers—one pair having finer flutes than the other—mounted in a frame, and turned by the necessary gearing. There is also a feed-table. In passing between the rollers the brittle woody parts of the stems are broken throughout their length. Later breaking-machines have more numerous fluted rollers, some of which have a reciprocating motion. The more efficiently the breaking is performed the less will be the amount of scutching required.

**Scutching.**—The woody matter of the flax stems being broken up and ready to be separated from the fibrous portion, this is done either by hand-scutching or, as is chiefly now the case, by scutching-

machines. In the hand-process the flax is hung up in such a position that it can be struck repeatedly with the blade of a scutching-knife, so as entirely to remove the woody portion. In scutching-mills—which are usually driven by water-power—the scutching is performed by a series of vertical wheels, on each of which are mounted a few wooden blades projecting considerably beyond the rim. These blades take the place of the scutching-knife, and work against wedge-shaped projections in a partition, striking the flax in the direction of its length, a workman sliding the 'broken' flax gradually forward as the scutching proceeds. Besides this arm-scutch in scutching-mills there are scutching-machines of more elaborate construction used in the dressing of flax. Brushing-machines are sometimes employed to give the flax a final cleaning before baling it for the market. For the manufacture of flax into cloth, see LIXEN, and SPINNING.

**Flax, NEW ZEALAND**, a valuable fibre quite different from common flax, and obtained from the leaf of a monocotyledonous, instead of the stem of a dicotyledonous, plant. The plant yielding it is *Phormium tenax*, often called New Zealand Flax, and sometimes Flax Lily and Flax Bush (Harakeke of Maoris). It belongs to the order Liliaceæ, and is an evergreen growing wild over large areas, and very easily cultivated, even upon the poorest soils; it has also been introduced into southern France and Dalmatia, and is familiar in colder climates as

New Zealand Flax (*Phormium tenax*):  
a, inflorescence; b, separate flowers, enlarged.

a decorative plant in greenhouses and sheltered gardens. Its leaves resemble those of an Iris, and are from two to six feet long and one to two or three inches broad. The flowers are produced in a tall branched panicle, and are numerous, brownish-yellow, and not very beautiful; the fruit is a three-cornered capsule, with numerous compressed jet-black seeds. The fibre of the leaves is both very fine and very strong, and was used by the New Zealanders, before their country was discovered by Europeans, for making dresses, ropes, twine, mats, cloth, &c. New Zealand flax is imported into Britain for making twine, ropes, sailcloth, and other uses to which its strength and durability alike well adapt it. To obtain the fibre the leaves are cut thrice yearly, and the fibre is easily separated by maceration. But the New Zealanders procure the fibre in its greatest perfection, very long and slender, shining

like silk, by a more laborious process, and without maceration, removing the epidemis from the leaf when newly cut, separating the fibres by the thumb-nails, and then more perfectly by a comb. The root-stocks are bitter and purgative, and have been used as a substitute for sarsaparilla. The leaves, when cut near the root, exude a viscid juice, which becomes thick and gummy, and is then eaten; the New Zealanders prepare a sweet beverage from the flowers.

**Flaxman, JOHN, R.A.**, sculptor, was born at York, 6th July 1755. His father, a moulder of plaster figures, removed to London when his son was six months old; and the delicate, slightly-deformed child, confined to home-pleasures and stimulated by the works of art which surrounded him, soon developed a taste for drawing. Seated in his little chair behind the counter, with his crutches by his side, he attracted the attention of some of his father's customers. The Rev. Mr Mathew found him attempting to teach himself Latin, and forthwith befriended him, introducing him to his cultured and refined home-circle, where his wife read Homer and Virgil to the boy. At the age of ten his health greatly improved, and he devoted himself to art. In 1767 and 1769 he exhibited models at the Free Society of Artists, and in the latter year he was admitted a student of the Royal Academy, whose silver medal he won in 1770, when he began to contribute to its exhibitions. From this period he was constantly engaged upon works of sculpture; but patronage was long of coming, and from 1775 till 1787 his chief source of income was the Messrs Wedgwood, whom he furnished with exquisite designs and decorations for their pottery, work for which he was admirably fitted by his unrivalled skill in modelling in relief. In 1782 he quitted the parental roof, established himself in a small house and studio in Wardour Street, and married Ann Denham, a cultivated and estimable woman, who was his true helpmate for thirty-eight years. He now began to be employed upon monumental sculpture, into which he infused much of pathos and of grace. Among his works of this class may be named his monument to Chatterton, in St Mary Redcliffe, Bristol; to Collins, in Chichester Cathedral; to Mrs Morley, in Gloucester Cathedral; and to the memory of Miss Cromwell. By 1787 he had gained enough by his art to warrant a visit to Italy, and, accompanied by his wife, he proceeded to Rome, and studied there for seven years. During this period he executed a group of Cephalus and Aurora; his ill-remembered group of 'The Fury of Athamas,' from Ovid; and his restoration of the Hercules torso; and began his great series of designs to the *Iliad* and the *Odyssey* (published 1793), to *Æschylus* (1795), and to Dante's *Divina Commedia* (1797), which were engraved in Rome by Piroli, under his own supervision, and widely extended his fame. They were followed by his designs to Hesiod, engraved by Blake in 1817. Returning to England in 1794, he occupied himself upon his fine monument to Lord Mansfield, in Westminster Abbey. In 1797 he was elected A.R.A., in 1800 R.A., and in 1810 he became professor of Sculpture to the Royal Academy. His lectures, which were collected in a volume in 1829, are judicious and well considered, but somewhat wanting in lightness, point, and charm of style. Among the works of his later life are his monuments to Sir Joshua Reynolds, to Lord Howe, and to Lord Nelson; 'Michael and Satan,' his most important example of ideal sculpture, executed for Lord Egremont; and his drawings and model for his great 'Shield of Achilles,' completed in 1818. He died 7th December 1826, and was buried in the church of St Giles-in-the-Fields, London.

Personally Flaxman was a man of extreme gentleness, modesty, and courtesy; simple and abstemious in his tastes; devout in spirit, a follower of Swedenborg. As an artist he ranks at the very head of English sculptors on account of his inventive power and felicity, and of the purity, grace, and sweetness of his style. Never has the beauty of Greek sculpture found a more perfect embodiment and reutterance in modern work. Occasionally, however, his productions are wanting in force and strength, and he was unequal to the suggestion of strenuous motion, or to the portrayal of the intenser passions. He was more skilful as a modeller than as a sculptor in marble, and more successful in bas-relief than in his treatment of the round. But, indeed, the simple and exquisite grace of his design is often seen most completely in the slighter of his pencil sketches in outline, which, along with his other works, may be studied in the Flaxman Gallery, founded by his wife's sister, his adopted daughter, in University College, London. See Allan Cunningham's *Lives of the Most Eminent British Painters, Sculptors, and Architects*, vol. iii. (1830); and Professor S. Colvin, *The Drawings of Flaxman in Thirty-two Plates, with Descriptions and an Essay on his Life and Genius* (fol. 1876).

**Flea**, a name applicable to any member of the small order Siphonaptera or Aphaniptera, of which *Pulex irritans* is a familiar example. They are wingless insects, probably related to flies; with saw-like, biting jaws (mandibles); with other mouth-appendages (labial palps) adapted for sucking; with legless, biting, maggot larvæ. The compressed shape of the body, the long, powerful, bristly legs, which are able to take such relatively gigantic leaps, and the abdomen with eight rings bearing bristles may be readily perceived on the common species; while microscopic examination will show the biting and sucking mouth-appendages, the small eyes and minute antennæ, and two pairs of little bristly scales, like remnants of wings, on the second and third segments of the thorax. The eggs, usually not numerous, are laid in safe corners, or in the fur, feathers, &c. of the animal infested; the hatching is rapid (six to twelve days), and bristly, footless larvæ emerge; after a few (eleven) days' voracity these form cocoons, and so rest in pupal quiescence for variable periods. In summer the entire development of *Pulex irritans* occupies about a month. The fleas

Metamorphoses of Common Flea (*Pulex irritans*), magnified:  
a, larva; b, pupa or nymph; c, perfect insect.

are all ectoparasitic on warm-blooded animals, and the numerous species are more or less rigidly confined to diverse furred and feathered hosts. The common flea (*Pulex irritans*) is sometimes regarded as the only species of the genus *Pulex*, and the others are ranked as species of *Ceratophyllus*, &c.; but this seems rather in honour of man as being the host of the first-named flea than from any real difference. It seems probable that the flea of the dog is an intermediate host of a tapeworm common in that animal. The muscular energy of these pests has

been utilised in 'flea-exhibitions,' in which tamed captives drag miniature carriages, and perform similar exercises. As regards their leaping powers, Kirby and Spence have the following note: 'Aristophanes, in order to make the great and good Athenian philosopher, Socrates, appear ridiculous, represents him as having measured the leap of a flea. In our better times scientific men have done this without being laughed at for it, and have ascertained that, comparatively, it equalled that of the locust, being also two hundred times its (the flea's) length.' Where fleas prevail in spite of cleanliness, recourse may be had to insecticide preparations, the modern substitutes for the old-fashioned fleabane and wormwood. According to Tusser, 'where chamber is swept and wormwood is strown, no flea for his life dare abide to be known.' The more formidable Chigoe (q.v.) or Jigger is separately noticed. See Frank Buckland, *Curiosities of Natural History*; Taschenberg, *Die Flohe* (1880); W. A. L. Philoppyllus, *Der Floh, von literarischer und naturwissenschaftlicher Seite beleuchtet* (1880).

**Fleabane** (*Pulicaria*), a genus of Compositæ (sub-order Tubulifloræ, family Inulacæ), readily recognised by a peculiar aromatic smell, sometimes compared to that of soap, which is said to be efficacious in driving away fleas. There are two British species, *P. vulgaris* and *P. dysenterica*, and the latter has a considerable reputation in diarrhoea and dysentery. *Conyza squarrosa*, also called fleabane, belongs to a closely allied genus.

**Fliche**, in French, a spire generally, is also used specially for the slender spire that sometimes rises from the intersection of the nave and transepts of large churches. A good illustration will be seen in the picture of Cologne Cathedral given in Vol. III. p. 358.

**Fliche**, L.A., a town of France, in the department of Sarthe, on the Loir, 60 miles NW. of Tours by rail. It has manufactures of paper, oil, leather, and timber, and since 1764 has been the seat of a famous military school (*Prytanée*), founded in 1607 as a Jesuit college, where Eugene of Savoy and Descartes were educated. Here, too, are the heart and a statue (1857) of Henri IV.; and here David Hume spent three years (1734-37). Pop. 7977.

**Flecknoe**, RICHARD, an Irish Roman Catholic priest and playwright, who after some ten years' travels in Europe, Asia, Africa, and Brazil (1640-50) came to London, mingled in the wars of the wits, wrote several plays, all of which are now forgotten, and died about 1678. His name is now remembered only as that of the stalking-horse over whom Dryden applied the merciless lash of his satire to Shadwell, the most virulent of his literary assailants. His famous satire, entitled *Mac Flecknoe*, is partly the model of Pope's more famous *Dunciad*. Flecknoe is represented as seeking for a successor to the throne over the realms of nonsense, on which he had long sat supreme, and as having fixed on Shadwell as the one of all his sons best fitted for it.

**Fleet** (that which floats), a collection of ships, whether of war or commerce, for one object or for one destination. 'Division' and 'squadron' are portions of a fleet. In the royal navy of Great Britain a fleet is ordinarily the command of an admiral or vice-admiral, and should, strictly speaking, consist of ten ships or more of the first class, with an appropriate number of cruisers, sloops, gun-vessels, torpedo-boats. Great Britain maintains a fleet in the Channel and another in the Mediterranean; whilst the number of her war-ships in the West Indies, India and China, and the Pacific enables these squadrons to assume the dimensions of a fleet by very trifling additions from other quarters.

**Fleet Prison**, a celebrated London gaol, which stood on the east side of Faringdon Street, on what was formerly called Fleet Market. The keeper of it was called the Warden of the Fleet. It derived its name from the Fleet rivulet (A.S. *fleot*, 'a bay'; afterwards applied to any shallow stream where small craft could float), which flowed into the Thames. The Fleet was the king's prison so far back as the 12th century. In the 16th century it acquired a high historical interest from its having been the prison of the religious martyrs of the reigns of Mary and Elizabeth; and the victims of the Star Chamber were confined here in the reign of Charles I., and numbers of Puritans in that of his son. Afterwards it became a place of confinement for debtors and persons committed for contempt from the Courts of Chancery, Exchequer, and Common Pleas. During the 18th century it was the scene of every kind of atrocity and brutality, from the extortion of the keepers and the custom of allowing the warden to underlet it. The Fleet was several times rebuilt; the last building was erected after the burning of the older one in the Gordon riots of 1780, the predecessor of which had been destroyed in the great fire of London in 1666. In 1776 Howard found here 243 prisoners, their wives and children numbering 475; there were also 78 outdoor *détenus* for debt, privileged to live within the 'rules.' In 1830-34 the annual number confined in the Fleet for debt ranged from 700 to 884. The prison was abolished in 1842, and the debtors transferred to the Queen's Bench, under the new name of the Queen's Prison. The buildings were demolished in 1845-46, and part of the site is now occupied by the Congregational Memorial Hall.

**FLEET MARRIAGES**.—The practice of contracting clandestine marriages was very prevalent in England before the passing of the first marriage act (see MARRIAGE). The chapels at the Savoy and at May Fair, in London, were long noted for the performance of these marriages; but no other place was equal in notoriety for this infamous traffic to the Fleet Prison. The first notice of a Fleet marriage is in 1613, and the first entry in a register is in 1674. Up to this time it does not appear that the marriages contracted at the Fleet were clandestine; but in the latter year, an order having been issued by the ecclesiastical commissioners against the performance of clandestine marriages in the Savoy and May Fair, the Fleet at once became the favourite resort for those who desired to effect a secret marriage. At first the ceremony was performed in the chapel in the Fleet, but by 10 Anne, chap. 19, sect. 176, marriages in chapels without banns were prohibited under certain penalties, and from this time rooms were fitted up in the taverns and the houses of the Fleet parsons for the purpose of performing the ceremony. Mr Besant's romance gives a vivid description of the persons who celebrated these marriages—real or pretended clergymen of the Church of England, who had been consigned for debt to the prison of the Fleet, and who shamelessly employed touters to bring to them such persons as required their office. The sums paid for a marriage varied, according to the rank of the parties, from half-a-crown to a large fee. During the time that this iniquitous traffic was at its height every species of enormity was practised. Young ladies were compelled to marry against their will; young men were decoyed into a union with the most infamous characters; and persons in shoals resorted to the parsons to be united in bonds which they had no intention should bind them. Registers of the marriages were kept by the various parties who officiated; a collection of these books, purchased by government in 1821, is deposited at Somerset House. In 1840 they were declared inadmissible as evidence in a court of law.

Various ineffectual attempts were made to stop the practice by acts of parliament, and at length, the nuisance having become intolerable, in 1753 an act was passed which struck at the root of the matter by declaring that all marriages, except in Scotland, solemnised otherwise than in a church or public chapel, where banns have been published, unless by special license, should be utterly void. The public, however, were unwilling to surrender their privilege, and on the 26th March 1754, the day before the act came into operation, there were no less than 217 marriages entered in one register alone. See Burn's *History of Fleet Marriages* (1833), and Ashton, *The Fleet: its River, Prison, and Marriages* (1888).

**Fleetwood**, or **FLEETWOOD-ON-WYRE**, a modern seaport and military station of Lancashire, at the mouth of the Wyre, 21 miles NW. of Preston by rail. Founded in 1836, it has an excellent harbour, and is a favourite resort for sea-bathing. A new dock was opened in 1877. Steamers ply daily to and from Belfast, and there is a regular service to the Isle of Man. Within the town is a lighthouse, the light, 90 feet high, being visible for 13 miles. Rossall School (q.v.) is two miles to the south-west. Pop. (1851) 3121; (1881) 6733.

**Flegel**, **EDUARD ROBERT**, born of German parentage at Wilna, in Russia, 13th October 1845, made it the principal object of his life to acquire for Germany the preponderating share of the commerce of the Niger. His first ascent of this river was made in 1879, in the steamer of the London Missionary Society, and his second a year later, when he reached Sokoto by a left-hand tributary of the river. But his next journey, in 1883, was the most fruitful in results, for during the course of it he discovered the sources of the Benue, to the south of Adamawa. After a short visit to Europe, he again started for Africa in April 1885, having been commissioned by the German African Society and Colonial Company to explore the country stretching between the sources of the Benue and the Cameroons; it was also his intention to penetrate from the Benue to the Congo, but he was suddenly struck down by death, near the mouth of the Niger, on 11th September 1886.

**Fleischer**, **HEINRICH LEBERECHEIT**, Orientalist, was born at Schandau, in Saxony, 21st February 1801. Having studied theology and oriental languages at Leipzig, he was for some years after 1828 engaged in cataloguing the oriental MSS. in the royal library at Dresden, the catalogue being published at Leipzig in 1831-34. After acting for five years as teacher in a school at Dresden, Fleischer was appointed professor of Oriental Languages at Leipzig in 1836. He edited Abulfeda's *Historia Moslemica* (1831-34), the continuation of Habicht's edition of the original of the *Thousand and One Nights* (vols. ix.-xii. 1842-43), Ali's *Hundred Sayings* (1837), Baidhavi's *Commentary to the Koran* (1846-48), and wrote an account of the Arabic, Persian, and Turkish MSS. in the town library of Leipzig, printed in Naumann's *Catalogue* (1838); also a *Critical Dissertation on Habicht's Glosses to the First Four Volumes of the Thousand and One Nights* (1836). He died 10th February 1888.

**Fleming**, **JOHN**, naturalist, born near Bathgate, Linlithgowshire, in 1785, entered the ministry, was professor of Natural Philosophy at Aberdeen, 1832-43, and filled the chair of Natural Science in the New College, Edinburgh, from 1845 till his death in 1857. His works include the *Philosophy of Zoology* (2 vols. 1822), a *History of British Animals* (1828), and *Molluscan Animals* (1837).

**Fleming**, **PAUL**, one of the best German poets of the 17th century, was born 5th October 1609, at

Hartenstein, in Vogtland. He studied medicine at Leipzig, and accompanied embassies sent by the Duke of Holstein to Russia and to Persia. He returned in 1639, married, and resolved to settle as a physician in Hamburg, but died there, 2d April 1640. Fleming stands at the head of the German lyric poets of the 17th century. His *Geistliche und weltliche Poemata* (1642) contain many exquisite love-songs, which for more than a century remained unequalled in finish and sweetness. Others are full of glowing enthusiasm, ardent patriotism, and manly vigour, while his sonnets are marked by strength and thorough originality. The most complete collection is that of Lappenberg (2 vols. 1866), who had already edited his Latin poems in 1863.

**Flemish Language and Literature.** See **HOLLAND** (LITERATURE OF).

**Flensburg**, a shipping-town in the Prussian province of Sleswick-Holstein, at the extremity of Flensburg fjord, an inlet of the Baltic, 19 miles N. of the town of Sleswick. Its principal industrial establishments embrace iron and machine works, copper and zinc factories, shipbuilding-yards, brick, cement, and lime works, and breweries; fishing and fish-curing are also carried on. Along with Sleswick-Holstein, Flensburg passed from Denmark to Prussia in 1864. Pop. (1875) 26,525; (1885) 33,094.

**Fliers**, a town of France, in the department of Orne, 41 miles S. of Caen by rail. It has large spinning, bleaching, and dyeing establishments, and is the centre of a busy manufacturing district, where linen and cotton goods, especially fustian and tiekings, are produced. It contains an old castle, which was burned down in the Chouan war, but since restored. Pop. (1872) 8011; (1886) 11,257.

**Flesh.** While in common parlance the term flesh is applied to those parts of the body composed of muscular tissue (see **MUSCLE**), it is now, in physiological language, used as a term including all the living protoplasmic matter of the body which has a chemical composition closely resembling that of muscle. This use of the word (*Fleisch*) we owe chiefly to the Munich school of physiologists, who have done so much to advance our knowledge of the chemical changes in the tissues. In such investigations the terms loss of 'flesh,' gain of 'flesh,' &c. are to be understood in this inclusive sense.

This flesh has something of the following composition:

|                 |       |          |
|-----------------|-------|----------|
| Water.....      | 75    | per cent |
| Solids.....     | 25    | "        |
| Inorganic.....  | 1     | "        |
| Organic.....    | 24    | "        |
| Proteids.....   | 10-10 | "        |
| (Nitrogen)..... | 3.4   | "        |

**Flesh-fly.** See **BLUE-BOTTLE**, and **FLY**.

**Fleta**, the title of an early treatise on the law of England, presumably written about 1290 by a judge who was confined in the Fleet prison. It consists of six books, the language being Latin. Selden edited it in 1647.

**Fletcher**, **ANDREW**, of Salton, a famous Scottish patriot, was born in 1655, the son of Sir Robert Fletcher, himself of English descent, and of Catharine Bruce, whose father, Sir Henry Bruce of Clackmannan, was directly descended from Robert Bruce. His father dying when he was still an infant, he was brought up under the care of the celebrated Gilbert Burnet, and early imbibed his preceptor's passion for political freedom, but not his prudence. After some years of continental travel, he sat in parliament in 1681 as commissioner for his native county, and offered so determined an opposi-

tion to the measures of the Duke of York that he found it necessary to flee to England, and thence to Holland. Here he formed fast friendship with the refugee English patriots, and on his return to England in 1683 shared the counsels of Rusell, Essex, Howard, Algernon Sidney, and John Hampden, the greater patriot's grandson. Though a republican, Fletcher was very far from being a modern democrat, for one of his favourite schemes was to utilise the hosts of vagrants and paupers of the time like the slaves of ancient Greece and Rome. On the discovery of the Rye-house Plot, Fletcher fled to Holland, returned as a volunteer with Monmouth, but was obliged almost at once to leave the army for having shot the mayor of Lyme in a personal quarrel about a horse. He now fled to Spain, but had no sooner landed at Bilbao than, at the instance of the English ambassador, he was flung into prison, from which he was soon mysteriously delivered by an unknown guide. In disguise he passed through Spain, not without further more than romantic adventures, in Hungary distinguished himself greatly as a volunteer against the Turks, and returned to Scotland at the revolution. He was the first patron of William Paterson, the founder of the Bank of England and projector of the Darien expedition, and it was the bitterness caused in Scotland by the base treatment the unfortunate Darien colonists received from King William's government that gave Fletcher and the nationalist party their strength in the struggle against the inevitable union with England. His famous 'Limitations' aimed at constructing a federative instead of an incorporating union—a frail structure that would have borne neither the burden of recent irritation nor the weight of ancient hatreds. Fletcher's orations in the Scottish parliament still glow with eloquence, and carry the stamp of genuine sincerity, but the modern reader has feelings other than admiration for a statesman whose eyes were too much blinded by prejudice to recognise that the only salvation for a country distracted by intestine jealousies and hopelessly corrupt domestic government lay through incorporation with the larger and healthier life of the great southern kingdom. After the consummation of the union, Fletcher retired in disgust from public life, devoting himself to promoting agriculture. His fanners for winnowing corn and his mill for making *pot-barley* were better gifts to his country than all his speeches. He died at London in the September of 1716. His writings were collected and reprinted at London in 1737. Fletcher is described as follows by a contemporary pen: 'He is a low, thin man, of a brown complexion, full of fire, with a stern, sour look; of nice honour, with abundance of learning, brave as the sword he wears, a sure friend and an irreconcilable enemy, would lose his life readily to serve his country, and would not do a base thing to save it. His thoughts are large as to religion, and not such as can be brought within the bounds of any particular set, and his notions of government are too fine-spun, and can hardly be lived up to by men subject to the common frailties of nature.' Fletcher of Salton's name survives popularly only in the famous but usually misquoted saying, in his *Account of a Conversation concerning a Right Regulation of Government for the Common Good of Mankind*: 'I knew a very wise man, so much of Sir Christopher's sentiment, that he believed if a man were permitted to make all the ballads, he need not care who should make the laws of a nation.'

**Fletcher**, GILES and PHINEAS, poets, were cousins of Fletcher the dramatist, and sons of Giles Fletcher, LL.D. (1549-1611), himself a poet and writer on Russia, and Queen Elizabeth's

minister in negotiations in Germany and at the court of Russia.—GILES, the younger of the two brothers, was born about 1588, was educated at Trinity College, Cambridge, and died at his living at Alderton, in Suffolk, in 1623. Fuller tells us that his 'clownish low-parted parishioners, having nothing but their shoes high about them, valued not their pastor according to his worth, which disposed him to melancholy and hastened his dissolution.' His chief poetical work is a sacred poem, entitled *Christ's Victory and Triumph in Heaven and Earth over and after Death*, published at Cambridge in 1610. It is full of splendid versification and imagery, and is saved from the fatal dullness of most professedly religious poems by a quickening glow of genuine enthusiasm. It is of course based upon Spenser, and most of his distinctive characteristics are imitated and overdone. The metre is original and not entirely successful. Each stanza has eight lines, the last an Alexandrine, rhyming thus: *ababbbcc*; and a lyrical interlude occurs here and there. The poem, although once admired, is now unknown to general readers, and is chiefly remarkable for having to some extent influenced the majestic muse of Milton. His poems were edited by Dr Grosart in the 'Fuller Worthies Library' (1868), and in 'Early English Poets' (1870).—PHINEAS was born in 1582, educated at Eton and King's College, Cambridge, and in 1621 became rector of Hilgay, in Norfolk, where he died in 1650. His most important poem, the *Purple Island, or the Isle of Man*, was published in 1633, in twelve cantos of seven-lined stanzas, a regular elegiac quatrain taking the place of the irregular quintet of Giles's poem. It contains an elaborate description of the human body, given with great anatomical minuteness. The body is an island, the bones its foundations, and the veins the streams by which it is watered. The vices and virtues that affect it are similarly allegorised with laborious ingenuity. Although to a large extent formal and pedantic, the *Purple Island* abounds in fine passages, in which the splendour of Spenser and the gravity of Milton are curiously mingled. His poetical works were edited by Dr Grosart in the 'Fuller Worthies Library' (4 vols. 1868).

**Fletcher**, JOHN (1579-1625). See BEAUMONT AND FLETCHER.

**Fleur-de-lis**, a heraldic device representing very imperfectly, as Littré says, three flowers of the white lily (*Lilium*) joined together: though often said to be a representation of the white iris, which is on that hypothesis called *Flower-de-luce* (q.v.). The *Fleur-de-lis*, or *Fleur-de-lys*, came to be the arms of the Bourbons and of France (see FLAG). The three heads of the *fleur-de-lis* have been said to *Fleur-de-lis*, typify the Trinity.

**Fleurus**, a market-town (pop. 5084) of the Belgian province of Hainaut, on the Sambre, 15 miles W. of Namur, has been the scene of three great battles: (1) in 1622, when the Germans, under the Duke of Brunswick and Count Mansfeld, defeated the Spaniards; (2) in 1690, when the French, under Luxembourg, routed the allied Germans and Dutch, commanded by the Prince of Waldeck; and (3) in 1794, between the French, under Jourdan, and the Austrians and their allies, under the Duke of Coburg, on which occasion the latter, although he had virtually beaten his antagonist, gave the signal to retreat.

**Fleury**, or **FLORY**, in Heraldry, signifies that the object is adorned with *fleurs-de-lis*; a cross-fleury, for example, is a cross the ends of which are in the form of *fleurs-de-lis*. See CROSS, TRESSURE, &c.

**Fleury**, ANDRÉ HERCULE DE, CARDINAL, Louis XV.'s prime-minister, was born in 1653, at Lodève, in Languedoc, became in 1677 almoner to the queen, and after her death (1683) filled the same post under Louis XIV., who in 1698 made him Bishop of Fréjus. Under Louis's will he was appointed preceptor to the heir-apparent, a child of five years, who in 1715 succeeded as Louis XV. In 1726, at the age of seventy-three, Fleury was raised by the young king to be prime-minister; in the same year he received the cardinal's hat. Fleury was honest and well meaning, but not a statesman: the extortions of the farmers-general were not checked, although it was probably for the people's sake that the minister practised a rigid economy that approached avarice and even crippled the power of France; whilst in foreign affairs he was earnestly desirous of peace, and yet was dragged by court intrigues into two wars over the succession to foreign thrones (see SUCCESSION WARS). The war of the Austrian Succession was not finished when he died, 29th January 1743, in the ninetieth year of his age, leaving the king thenceforth to the unchecked guidance of his mistresses. Fleury was an academician, and the friend and patron of learning; he sent out two expeditions to measure arcs of the meridian, gathered rare MSS. from Egypt and Greece, and completed the Bibliothèque Royale (now Nationale). See Verlaque, *Histoire du Cardinal Fleury* (Paris, 1879).

**Fleury**, CLAUDE, church historian, was born at Paris in 1640, and forsook the law for an ecclesiastical career. In 1672 he became tutor to the young Princes de Conti, and at a later period to the Comte de Vermandois, natural son of Louis XIV. After the death of the young count in 1693, the French monarch appointed Fleury abbot of the Cistercian monastery of Loc-Dieu, and afterwards, under Fénelon, tutor to the Dukes of Burgundy, Anjou, and Berri. He was elected to fill La Bruyère's place in the Academy in 1696; and ten years later, on the completion of the prince's education, he was rewarded with the priory of Argenteuil. The Duke of Orleans selected him for confessor to the young king, Louis XV., giving as his reason for so doing that Fleury was neither Jansenist, nor Molinist, nor Ultramontanist, but Catholic. He died 14th July 1723. Fleury was as learned as he was modest, and as mild and kind-hearted as he was simple in his manners and upright in his conduct. Among his numerous works may be mentioned *Mœurs des Israélites* (1681); *Mœurs des Chrétiens* (1682); *Institution du Droit Ecclésiastique* (1687); and, above all, the *Histoire Ecclésiastique* (20 vols. Paris, 1691-1720). On this work, really the first complete and systematic history of the church, its organisation, doctrines, and rites, Fleury laboured thirty years. It is marked by great learning, and, on the whole, by a judiciously critical spirit. The work was translated into many languages, and praised by orthodox and heretics, both for its matter and style. Fleury's own work only reached to 1414; it was continued to 1778 by Fabre, Lacroix, and others.

**Flexure** is the bending or curving of a line or figure (see CURVE). In building, flexure denotes the bending of loaded beams; see STRENGTH OF MATERIALS.

**Fliedner**, THEODOR, founder of the Protestant order of Deaconesses (q.v.), was born in Nassau in 1800, and in 1822 became pastor of Kaiserswerth, near Düsseldorf, where in 1836 he founded the first deaconesses' home and a seminary for infant-school teachers, besides other institutions. He died 4th October 1864.

**Flies.** See FLY, ANGLING.

**Flight.** See FLYING.

**Flinders**, MATTHEW, an English navigator, who surveyed a great portion of the Australian coasts, was born at Dornington, in Lincolnshire, 10th March 1774, and in 1790 entered the navy. Going out to Australia in 1793, he determined to investigate the coast south of Port Jackson, about 250 leagues of which were laid down in the charts as 'unknown.' With an equally daring and ambitious young surgeon in his ship, named Bass, he departed on the enterprise in a small decked vessel, with a crew of only six men. Their chief discovery was the strait between Van Diemen's Land (now Tasmania) and the mainland of Australia, which was named after Bass. In 1801 Flinders obtained from the British government the command of a scientific expedition for the investigation of the Australian coasts and their products. Commencing his examination at Cape Leeuwin, Flinders in the course of two years gradually explored the coast to Bass Strait (q.v.), thence northwards—laying down carefully the Great Barrier Reef—to the Gulf of Carpentaria, which he thoroughly surveyed across to Timor, then back to Cape Leeuwin, and round the south coast to Port Jackson (1803). On his way home he was first wrecked, and then detained a prisoner by the French governor of Mauritius, and not allowed to proceed to England until 1810. He gave the world the result of his explorations in *A Voyage to Terra Australis*, and died July 19, 1814, the day on which his book was published.—The coast of South Australia was long called after him Flinders Land. His name is still attached to the southernmost county in Eyre Peninsula, and to Flinders Island, off that coast; to the Flinders Range in South Australia, rising near the head of Spencer Gulf, and running north (highest peaks, 3100 feet); as also to a small town in Victoria, 61 miles SE. of Melbourne.

**Flindersia**, a sub-genus of Swietenia (Cedrelaceæ), of which *F. (S.) scyriulensis* and *F. australis* yield timber in their respective countries little inferior to true mahogany (*S. Mahagoni*), and largely imported as African mahogany, Madeira mahogany, or Calcedon wood.

**Flint**, a mineral which may be regarded as a variety of quartz, allied to chalcedony, consisting almost entirely of silica, with a very little lime, oxide of iron, water, carbon, and sometimes even traces of organic matter. It has a flat shell-like fracture, is translucent or semi-transparent, and varies in colour from a very dark brown, or almost black, to light brown, red, yellow, and grayish-white, and is sometimes veined, clouded, marbled, or spotted. Dark-coloured flints are most common in the chalk, in which principally flint occurs imbedded, forming tabular sheets and nodules of various sizes, sometimes large nodular masses, of irregular and often grotesque shape; but gravel formed of light-coloured flints is very common, and it is disputed whether or not a change of colour has taken place by exposure to atmospheric and other chemical agencies. Flint is sometimes found in beds or veins. It is very abundant wherever the chalk formation extends, in England and other countries; rolled flint nodules are also often found in conglomerate rocks, and in alluvial soils—vast alluvial tracts being sometimes full of them. Flint geodes often contain crystals of quartz. Flint nodules are usually moist in the interior if broken when newly taken from their beds.

Flint is sometimes harder than quartz, sufficiently so to scratch it. The readiness with which it strikes fire with steel is well known, and it would seem that the sparks are not all merely incandescent particles, heated by the friction, but that in some of them a chemical combination of silica and iron

takes place, causing great increase of heat. The use of the flint and steel for igniting tinder, once so common, has been almost superseded by that of lucifer matches, and gun-flints have given place to percussion-caps. The most ancient use of flint was probably for sharp weapons and cutting instruments; and flint knives, axes, arrow-heads, &c. are among the most interesting relics of rude antiquity. In East Anglian churches squared flints have been used for centuries to ornament the porches, towers, buttresses, &c.; but at present the principal use of flint is in the manufacture of fine earthenware, into the composition of which it enters, being for this purpose first calcined, then thrown into cold water, and afterwards powdered.

The origin of flint is a subject of considerable difficulty. Siliceous deposits are sometimes the result of a purely chemical operation, as in the case of the siliceous sinter formed round the geysers of Iceland, from the evaporation of water largely charged with silica. But at the bottom of the sea, as no evaporation could take place, some other agent than springs of water saturated with siliceous must have supplied the materials. It is a fact of considerable importance in this inquiry that almost all large masses of limestone contain siliceous concretions, or flints. Thus, chert is found in carboniferous and other limestones, and menilite in the tertiary limestones of the Paris basin. The conditions necessary for the deposition of calcareous strata seem to be those required for the formation of siliceous concretions. The materials of both exist in solution in sea-water, and, as it needed the foraminifer, the coral, the brachiopod, and the mollusc to fix the carbonate of lime which formed the chalk deposits, so the siliceous was secreted by innumerable diatoms and sponges, and their remains most probably supplied the material of the flint. The discovery by Dr Dowerbank and other microscopists of the spicules of sponges and the frustules of diatoms in almost every specimen of flint has clearly shown that flint to a large extent, if not entirely, owes its origin to these minute organisms. After the death of the organisms their silica appears to have been redissolved and redeposited, perhaps through the agency of decomposing animal matter, sometimes in the form of irregular concretions, and sometimes replacing the calcareous skeletons and exuviae of other organisms.

**Flint**, a parliamentary borough and seaport in the east of Flintshire, North Wales, on the left side of the estuary of the Dee, 13 miles by rail NW. of Chester. In the vicinity are very extensive alkali-works, besides copper-works, collieries, and lead-mines. Pop. (1851) 3296; (1881) 5096. It unites with Caergwrle, Caerwys, Holywell, Mold, Overton, Rhuddlan, and St Asaph in sending one member to parliament. Flint Castle, built by Edward I., captured by the parliament in 1643, and four years later dismantled, exists in a ruined condition. Here Richard II. surrendered to Bolingbroke, 19th August 1399. See Taylor's *Notes on the History of Flint* (1873).

**Flint**, a maritime county of North Wales, bounded on the NE. by the river Dee, on the E. by Cheshire, on the S. and W. by Denbighshire, and on the N. by the Irish Sea. The main portion of the county is 26 miles long by 10 to 12 broad, and the detached hundred of Maelor, lying 8 miles SE. of the main part, measures 9 miles by 5. Flintshire is the smallest of the Welsh counties, its area being 289 sq. m. The coast is low and sandy, but along the Dee estuary fertile. The county is bisected by a low range of hills, stretching almost due north. The geological basis consists of rocks of the Carboniferous series. Coal, iron, lead, copper, calamine, zinc, and limestone are the chief mineral

products. Some chemical works and potteries of coarse clay give employment. There are numerous well-watered and picturesque valleys, the soil of which is for the most part fertile and well cultivated. The uplands afford good pasturage. The Dee in the east and the Clwyd in the west of the county are the principal rivers. The Chester and Holyhead Railway skirts the east and north shores. Pop. (1801) 39,469; (1881) 80,587; (1891) 77,189. Flintshire returns one member to parliament; its county council consists of fifty-six members. The chief towns are Flint, Mold, St Asaph, Holywell, and Hawarden. Flintshire has traces of Roman lead-mines, and is traversed by Watt's and Olla's Dykes. In the 7th century Saxon invaders massacred all the Christian monks of the monastery of Bangor-iscoed (q.v.). Several barrows and menhirs occur in the county. See D. R. Thomas, *History of the Diocese of St Asaph* (1874).

**Flint**, capital of Genesee county, Michigan, on the Flint River, 64 miles NNW. of Detroit by rail, with numerous sawmills, and manufactures of beer, flour, bricks, paper, machinery, &c. There is a large state institution for the deaf, dumb, and blind here. Pop. (1884) 9087.

**Flint**, ROBERT, theologian, was born at Dumfries in 1837, educated at the university of Glasgow, and ordained in 1859 to the East Church, Aberdeen, whence he was transferred in 1861 to the parish of Kilconquhar in Fife. In 1864 he was called to the chair of Moral Philosophy at St Andrews, and in 1876 to that of Divinity at Edinburgh, receiving at the same time the degree of D.D. from the latter. His *Philosophy of History in France and Germany* (vol. i. 1874) established his reputation as a profound thinker and scholar of unusually wide erudition, and procured him the honour of being elected a corresponding member of the French Institute. This was followed in 1876 and 1877 by two series of admirable lectures on the Baird foundation, *Theism and Anti-Theistic Theories*, and by a monograph on Vico (1884), in Blackwood's 'Philosophical Classics.'

**Flint Glass.** See GLASS.

**Flint Implements and Weapons** of the primitive peoples of prehistoric times are commonly found in the graves or on the sites of settlements of the earlier inhabitants of almost every country in Europe. They also occur not only in the surface soil or *humus* and in peat-bogs, beds of rivers and lakes, but naturally imbedded in such superficial or quaternary deposits as the old terraces of river-valleys. These terraces, which are formed of gravel and sand deposited by the river, are the marginal remains of the old river-bed, which, having been gradually deepened by the erosion of the current, has left here and there portions of the fringes of earlier deposits on the slopes of the valley. Flint implements, however, are not universally distributed through the diluvial drifts; for, while they occur pretty generally over the south-eastern area of England, they have not been found in the northern and western areas, nor in Scotland. Similarly, on the Continent, although they are found somewhat abundantly in the north-western area of France, they do not occur in Denmark, Sweden, or Norway. The types of flint implements found in these river-gravels closely resemble those from the caves of Périgord in France, and from Kent's Cavern and other caves in England. Besides possessing similar typical forms, the flint implements from the river-drifts and caves are in both cases found associated with the remains of animals which either are extinct or are no longer indigenous. For this reason, and also because the flint implements found in these associations are fashioned by chipping alone, they have

been assigned to the earlier part of the Stone Age (q.v.). On the other hand, the flint implements, whether fashioned by chipping alone or finished by grinding and polishing, which are found in the surface soil, or in graves, or in lake-dwellings, &c., and in association with remains of the common domestic animals, are assigned to the later part of the age of stone. The types characteristic of these two divisions being thus distinguished by their form and finish, as well as by their associations, are classified by archaeologists as palæolithic and neolithic implements.

The palæolithic implements of rudely chipped flint are reducible to three classes. The first or best finished is an oval, sharp-rimmed implement, with a cutting-edge all round, the second a long, pointed implement, and the third a tongue-shaped implement. They differ from the neolithic types most markedly in this, that they do not obviously reveal their special uses and purposes, and that their conceivable uses or purposes are few in comparison with those so obviously disclosed by the more specialised forms and the more elaborate finish of the neolithic types, which a glance suffices to classify as arrow and spear heads, daggers, knives, saws, bovers, serapers, chisels, axes, &c. Most of the neolithic implements are finely shaped and carefully finished, while some varieties, such as the long thin knife-blades and the handled dagger-blades of Denmark and Sweden, which are finished by chipping only, are perfect marvels of workmanship—so skilfully executed that experienced lapidaries and scientists can only speak of the process of their manufacture as a lost art. No modern savages or barbarous tribes of the historic period have produced anything approaching to the masterpieces of prehistoric flint-working. Flint, from its conchoidal fracture, is the only kind of stone that is capable of being readily worked into a variety of shapes by flaking and chipping, and this is probably the chief reason why the palæolithic implements have been formed almost exclusively of this material. The methods of manufacture appear to have been in all ages pretty much the same, and in general they seem to have been analogous to those employed in the manufacture of gun-flints and strike-lights of flint still carried on at Brandon (q.v.) in Suffolk, the principal differences being that steel tools are now used instead of tools of stone and bone, and that the finer processes of surface chipping and flaking are not now practised. Detailed descriptions of the various processes of flint-working, and of the ancient and modern methods of manufacture, are given in the first part of Mr Evans's work on the *Ancient Stone Implements, &c. of Great Britain* (Lond. 1872); and, for the finer forms of flint implements, see Madsen, *Afbildninger af Danske Oldsager* (Copen. 1869), and Montelius, *Civilisation of Sweden in Prehistoric Times* (Lond. 1889).

**Flintlock.** See FIREARMS.

**Flint River,** in Georgia, U.S., rises about 10 miles S. of Atlanta, and unites, after a southerly course of some 400 miles (of which 150 are navigable for steamboats), with the Chattahoochee, at the south-west angle of the state, to form the Appalachicola (q.v.).

**Flintshire.** See FLINT.

**Flinty Slate** is an impure quartz, assuming a slaty structure. It contains about 75 per cent. of silica, the remainder being lime, magnesia, oxide of iron, &c. Its fracture is rather splintery than shell-like. It is more or less translucent. It passes by insensible gradations into clay-slate, with which it is often in most intimate geological connection. Lydian Stone (q.v.) is a variety of flinty slate.

**Floating-battery,** a hulk heavily armed and made as invulnerable as possible, formerly used in defending harbours or in attacks on marine fortresses. They were used by the French and Spaniards in the memorable siege of Gibraltar (q.v.) in 1779-83, when ten of these vessels, carrying 212 large guns, were brought to bear on the fortress; they had sides of great thickness, and were covered with sloping roofs, to cause the shot striking them to glance off innocuously. But General Elliott succeeded in destroying them with red-hot cannon-balls. Steam floating-batteries of iron were constructed for the war with Russia in 1854, both by the British and French governments; but, notwithstanding that they rendered good service before Kinburn, they have since been discarded. They are interesting as a stage in the development of the modern ironclad.

**Floating-docks.** See DOCKS.

**Floating-islands** are formed either by the aggregation of driftwood in the creeks and bays of tropical rivers and the deposition thereon of soil and vegetable matter, or by the detachment of portions of a river-bank or lake-shore, on which the interlacing roots of plants constitute a foundation sufficiently strong to support soil whereon herbage, and occasionally even trees, are able to grow. Such islands are sometimes seen 50 or 100 miles distant from the mouth of the large rivers of America, Asia, and Africa. Portions of the alluvial soil from river-deltas, held together by the roots of mangroves and other trees, are sometimes detached by hurricanes or typhoons and then swept out to sea; such islands have been met with in the Philippines, in the seas of the East Indies, and in the Pacific. A floating-island is mentioned by Herodotus as existing in Egypt. Others were known to Roman writers; Seneca speaks of them as being in the Vadimonian, Cutilian, and Stationian lakes in Italy; to these Pliny adds the islands floating on lakes near Cuenabum, Rente, and Modena, and two others in Asia Minor. Those

known with floating-islands. Passing over others in Prussia, Italy, and South America, we come to Great Britain, where we find it recorded that Loch Lomond long possessed a floating-island, which has now, however, disappeared or become attached to one of the stationary islands of the loch. In Ireland large masses of peat float about some of the bogs—the Bog of Allen, for instance. In England, in Lake Derwentwater, there is an instance of an island which appears and disappears from time to time in the same spot. Perhaps the most satisfactory of the many theories which have been proposed to account for this phenomenon is that which attributes its rising from the bottom of the lake, where it ordinarily rests, to the permeation of its mass by marsh-gas during hot weather, the upward motion being assisted by the growth of buoyant water-plants on its surface. See Symons, *Floating Island in Derwentwater* (1888).

Between 1690 and 1829, similar islands were observed at irregular intervals, generally, however, after great droughts and violent storms, in Lake Rälång in the Swedish province of Småland. Oceanic floating-islands sometimes perform important service in the transportation of vegetable seeds from place to place, also in the distribution of animal species, by carrying insects, land molluscs, and small mammals, more rarely reptiles. Darwin met with islands floating on Lake Tagna-Cagua in Chili which passed from side to side of the lake and carried 'cattle and horses as passengers.' Between 1863 and 1881 the rivers of the central

Nile system were rendered almost unnavigable owing to the accumulations of floating vegetable matter getting set fast across the channels, practically forming dams, which in some instances gave rise to serious inundations. The vale of Cashmere contains many lakes, which frequently overflow and drown the surrounding country. This has taught the inhabitants to construct floating-gardens for the cultivation of their vegetables. The gardens are in reality portions of the marshy ground made to float artificially by cutting through the roots of the reeds and other plants about two feet below the surface. The Chinese, too, devote considerable attention to this style of horticulture, but more by way of ornamentation. Floating-gardens, or *chinampas*, also existed in Mexico before the Spanish conquest. Clavigero describes them as formed of wicker-work, the stems of water-plants, and mud, the largest sometimes having on them a tree or a hut. Both flowers and vegetables were grown on them.

**Floatstone**, a variety of quartz, consisting of fibres—delicate crystals—aggregated so that the whole mass is sponge-like, and so light, owing to the air confined in the interstices, as to float for a while in water. It is found in a limestone of the chalk formation near Paris, in imbedded masses, or interesting flint nodules.

**Flodden**, BATTLE OF, fought between James IV. of Scotland and an English army under the Earl of Surrey, September 9, 1513, the most grievous defeat ever Scotland suffered. King James, with 30,000 men, had taken up a strong position on Flodden Hill, one of the east and lowest spurs of the Cheviots, about 6 miles south of Coldstream, and on the morning of the 9th the Earl of Surrey, with 32,000 men, advanced from the south-east, crossed the Till by a skilful movement, and thus cut off all communication between King James and Scotland. James neglected the opportunity of attack while the English were crossing the river, but, seeing that they were aiming at taking up a strong position to the north-west of Flodden Hill, ordered his tents to be set on fire, and advanced to the attack about four o'clock in the afternoon. The Earls of Huntly and Home, who commanded the left wing of the Scottish army, charged the English right, which was led by Sir Edmund Howard, and entirely defeated it, but Home's borderers threw away the advantage of their success by commencing to pillage the baggage of both armies. On the Scottish right the clansmen under Lennox and Argyll, goaded to fury by the English archers, rushed heedless of order upon their opponents, but were routed with great slaughter and put to flight. Meantime a desperate resistance was made by the Scottish centre, where the king fought on foot among his nobles. Night fell upon them still fighting heroically, the ring still unbroken, though within it the king lay dead. The Scots held the hill during the night, but at dawn retreated with a loss of from 5000 to 12,000 men, including the flower at once of bravery and of rank. The Archbishop of St Andrews and as many as twelve earls were among the slain, and long after, indeed, there was not a worshipful Scots family that did not own a grave on Brankstone Moor. The English loss amounted at most to 4000; but Surrey's victory was so nearly a defeat that he was unable to prosecute the war with any vigour. The sixth canto of Sir Walter Scott's *Marmion* contains a splendid and fairly accurate description of the battle. See Robert White, *The Battle of Flodden* (Newcastle, 1859).

**Flogging**. Corporal punishment, which, in deference to public opinion, was abolished in 1881, had existed from time immemorial in the

British army and navy. It was often inflicted upon slight occasion, and with barbarous severity. Thus, at the beginning of the 19th century court-martial sentences of a thousand lashes were very common for mutiny and other grave offences even in time of peace. After the Crimean campaign, however, it became usual, unless the troops were on active service, to remit the sentence of corporal punishment, which a court-martial could still legally award to the extent of fifty lashes, administered with a whip or 'cat' of nine tails on the bare back. The Act of 1879 went further in this direction, and made it illegal to inflict corporal punishment except on active service, for offences punishable by death, and limited the amount to twenty-five lashes. Finally this provision was repealed by the Army Act of 1881, and summary punishment provided as a substitute. This consists of hard labour, personal restraint by being kept in fetters, and, in its severest form, of being attached to a fixed object in such a manner as to be kept in a fixed position for two hours at a time. Soldiers are still liable to corporal punishment, limited to twenty-five lashes, when in prison, for an offence against the prison rules, and for highway robbery with violence.—In European armies recruited by conscription from all classes of society, flogging is not a military punishment, but sentence of death is more often inflicted.

As a punishment for misdemeanours at common law whipping has never been formally abolished, though it has never been exercised in modern times except under the provisions of some special statute. Local police acts give power to whip juvenile offenders; and by a statute of 1863 (which does not apply to Scotland) flogging was made a competent punishment for certain forms of robbery with violence, as garrotting. Sir James Stephen says of this statute that it is 'an act so capriciously worded, that if a man beat a woman about the head with intent to rob her he may be flogged, but not if his object is to ravish or murder her.'

At common law the instrument to be used for whipping and the number of strokes are left to the discretion of the person who inflicts the punishment. When sentence of whipping is pronounced by justices, the order must specify the instrument and the number of strokes. If the offender is under fourteen years of age, the number of strokes must not exceed twelve, and the instrument must be a birch rod. Under the Act of 1863 a court may direct a person convicted of robbery to be privately flogged—not more than three times. If the offender is under sixteen, the number of strokes at each whipping must not be more than twenty-five; and, no matter what the offender's age, the number must not be more than fifty. In Scotland no offender above sixteen years can be whipped for theft or for any crime committed against person or property.

**Flood**, HENRY, Irish orator, was born in 1732, and educated at Trinity College, Dublin, and at Christ Church, Oxford. Elected to the Irish parliament as member for Kilkenny in 1759, and for Callan in 1761, he soon became a leader in the popular party. His oratory was vigorous and impressive, but was marked by all the offensive personalities of his time. In 1769 he was unfortunate enough to kill an electioneering opponent in a duel, and was brought to trial, but acquitted. In 1775 he took office as vice-treasurer of Ireland, but was removed in 1781 on account of his strong nationalist sympathies. Disliking Grattan's Irish Bill of Rights as not going far enough, Flood strove without success to carry a more sweeping measure, and became involved in a bitter quarrel with his former friend, which would have resulted in a duel but for the timely intervention of the authorities. In 1783 he

was returned for Winchester to the English House of Commons, and two years later for Seaford, but he failed to make as great a mark at Westminster as in Dublin. He died at Farnley, his seat near Kilkenny, December 2, 1791, leaving £5000 a year to Trinity College, Dublin. See his *Life and Correspondence*, edited by W. Flood (Lond. 1838).

**Floods and Inundations** are caused by excessive rains, giving rise to an overflow of the rivers; by the bursting of the banks of rivers, lakes, and reservoirs; by the sudden melting of ice and snow; and by irruptions of the sea, produced by high tides, wind-storms driving the sea-water inland, earthquakes, volcanic outbreaks, and the bursting of sea banks. The felling of forest trees throughout extensive tracts of mountainous country also tends to make the rivers which have their origin there swell rapidly after a heavy rainfall; good and complete drainage of land has the same tendency. For the Noachian flood, see DELUGE. The subjoined list embraces some of the most disastrous floods and inundations of which we have record.

- 634 A.D. Japan; 780 sq. m. of Isle of Shikoku covered by sea.  
 693. Persian Gulf; many cities destroyed, and new islands formed by irruption of sea.  
 1014. Many English seaports destroyed by sea.  
 1033 or 1160. East of Kent inundated; Goodwin Sands formed.  
 1100 or 1103. Flanders inundated.  
 1101 or 1105. Shelly; irruption of sea; thousands drowned.  
 1170. Holland and Friesland; great flood.  
 1173. Holland; Zuyder Zee much enlarged.  
 1219. Norway; lake burst; 36,000 people perished.  
 1223. Friesland; invasion of sea; 100,000 people drowned.  
 1277. Friesland; the Dollart formed.  
 1280-87. Holland on both sides of Zuyder Zee inundated in consequence of a storm.  
 1800. Holland; islands of Texel, Vlieland, and Wieringen separated from mainland, and Marsdiep, the channel between Texel and North Holland, formed.  
 1421 or 1446. Holland; 72 villages inundated, of which 20 permanently, about 100,000 persons drowned, Biebosch formed east of Dordrecht, and this town separated from mainland.  
 1521. Holland; 100,000 lives lost by an inundation.  
 1570. Holland; storm drove in the sea, destroying numerous villages and 20,000 people in Friesland.  
 1617. Catalonia, Spain; 15,000 perished in floods.  
 1620. Mexico (city) inundated.  
 1642. China, at Kailong; 800,000 drowned.  
 1646. Holland and Friesland inundated; loss of life, 110,000.  
 1720. Floods and inundations all over Europe.  
 1745. Peru; Callao destroyed by irruption of sea caused by earthquakes.  
 1767. England; irruption of sea on east coast.  
 1782. Formosa; west side of island submerged, and Taiwan destroyed.  
 1757-58. India, in North-western Provinces and Punjab; 15,000 lives lost by floods.  
 1791. Cuba; floods from excessive rain; 3000 drowned.  
 1811. Hungary; 24 villages swept away by overflow of Danube.  
 1813. Austria, Hungary, Poland, and Prussian Silesia; floods caused by rains; 4000 perished in Poland, 6000 in Silesia.  
 1824. St Petersburg and Cronstadt; 10,000 lives lost from overflow of Neva.  
 1825. Denmark; sea broke through from North Sea to Limfjord, making northern Jutland an island; one-third of Friesland submerged by rising of sea and rivers.  
 1840. France; overflow of Saône and Rhone swept away many villages and inundated Lyons, Avignon, Nîmes, Marseilles, &c.  
 1851. Northern China; Yellow River burst its banks, and made a new outlet into Gulf of Pechili.  
 1862. Floods throughout Europe from Belgium to Switzerland.  
 1866. South of France; floods did damage to extent of £6,000,000.  
 1868. Peru; Arica and Iquique nearly destroyed by earthquake waves.  
 1871. United States; Mill River valley (Massachusetts) inundated by bursting of a dam; 144 drowned. Also floods in western Pennsylvania; 230 drowned.  
 1875. Disastrous floods throughout central Europe, in United States, Burmah, India, and West Indies.  
 1876. China; floods in northern provinces; in Bengal 202,000 persons perished from inundation of a tidal wave.  
 1833. Java and Sumatra; west coast of former and east coast of latter submerged by volcanic wave, new islands formed in Sunda Straits, whilst part of Krakatoa disappeared.  
 1887. China; floods in Ho-nan, caused by the Hoang-ho bursting its southern bank; millions of lives lost.  
 1880. Johnstown (Pennsylvania), United States; 10,000 lives lost from bursting of a reservoir.

There are certain parts of the world which are periodically submerged, such as extensive tracts in

the North Valley of Siam, Cochin-China, Annam, &c. See, for a detailed list of floods and inundations, C. Walford, in *Journal of Statistical Society*, 1878, pp. 451-467.

**Floor.** The floors of the upper stories of ordinary houses are nearly always constructed of wood, but in many large public and other buildings all the floors are fireproof, some of these, for example, being formed of a series of flat brick arches between iron girders. Basement floors and others near the level of the ground are often laid with flagstones, tiles, or cement, but many of these are also of wood. According to the nature of their construction, wooden floors are of three kinds—viz. *single*, *double*, and *framed floors*. When the span between the walls does not exceed 15 feet, a single-joisted floor is sufficiently strong. Sometimes it is even adopted

Section of a Single Floor:  
 a, b, c, d, joists; s, strutting; f, flooring-boards; p, sound or deafening boarding; p, pugging or deafening; m, ceiling-lath; n, plaster.

for a 20-foot span. The annexed figure shows the section of a floor of this kind. The joists vary in section; but 9 inches by 3 inches for moderate, and 11 inches by 3 inches for larger spans are common sizes, and they should not be more than 16 inches apart from centre to centre. They are laid at the ends on wall-plates of wood. If their lengths much exceed 10 feet, joists should be struttet in order to stiffen them and keep them in position. This can either be done by herring-bone strutting, shown in the figure, which is the better way, or by key strutting with solid pieces of wood morticed through the joists with small tenons. The latter method is called 'dwanging' in Scotland, and the rows of dwangs or keys are usually nailed between the joists. The lines of struts or keys should be at intervals of about 7 feet. Flooring-boards are nailed on the top of the joists, and laths (q.v.) on the bottom of them to support the plaster of the ceiling of the room below. To prevent the passage of sound to and from rooms between which the floor forms the horizontal partition, what is called 'pugging,' or (in Scotland) 'doefening,' is required. It consists of coarse plaster, &c., laid on rough boards or laths supported on fillets nailed to the sides of the joists (see BUILDING).

**Double-joisted floors** are constructed by laying strong timbers, called *binders* or *binding-joists*, from wall to wall, at a distance of about 6 feet apart; and a double set of joists, one above for the flooring-boards, and one below for the ceiling, are laid across these, and notched down upon them. Of these the upper ones are called *bridging-joists*, as they bridge over the interval between the larger binding-joists. A *bay* is the general name for the space between binders; if between a binder and wall, it is called a *tail bay*.

The **framed floor** is one degree more complex than the double-joisted. Binding and bridging joists are used in the framed floor, but the binding-joists cease to be the primary support, as for this purpose strong balks of timber, called *girders*, are used. They are laid across, at distances of from 8 to 10 feet, and the binding-joists are framed into them by a *task-tenon* joint. The bridging-joists are notched to these in the same manner as for double-joisted floors. When the span is too great for a wood-girder, either a girder wholly of iron is used, or one formed of a wrought-iron plate with

wood on each side, all three pieces being bolted together. The latter is called in Scotland a 'sandwich beam.'

Flooring-boards are jointed in several ways. Perhaps the most common is the *grooved and tongued* joint, in which a tongue worked on one edge of a board fits into a groove in the next board. In a *ploughed and tongued* joint each board is grooved on both sides, and a separate tongue of wood or iron inserted. A *rebated* joint means that each board is checked along the edges, and these fit into reverse checks on the two adjoining boards. In a *dowelled* joint the edges of the boards are square and unbroken, and small oak pins or dowels are inserted at intervals in holes bored along the edges. Flooring-boards should not be more than 6 inches broad, and in the best floors they do not exceed 3 or 4 inches. They are from 1 inch to 1½ inch thick—very commonly 1½ inch. On the continent of Europe polished oak floors are very common. In America, and occasionally in Britain, two thicknesses of flooring-boards are used in floors of a superior description.

For fireproof flooring, see FIRE; and for special kinds of ornamental and other floors, see ASPHALT, CONCRETE, ENCAUSTIC TILES, MOSAIC, and PARQUETRY.

**Floorcloth.** There are several kinds of floorcloth. Formerly the name was confined to painted canvas, which is now called oilcloth; but the more recently introduced linoleum and other fabrics in which ground cork bulks largely are now extensively used for covering floors.

**Oilcloth.**—The basis of oilcloth is a coarse canvas generally made of jute, but it is stronger when made of flax tow. It is woven into pieces often as long as 150 yards and as wide as 8 yards. The first step is to fix a piece of this, say 75 feet in length by 24 feet in width, upon an upright frame provided with screws by means of which the canvas can be uniformly stretched. Stages or platforms are placed at convenient heights to enable the workmen to cover the canvas. Before paint is applied the canvas receives a coating of size, the chief object of which is to prevent injury to the cloth by acid products arising from the oxidation of the linseed-oil with which the paint is made up. When the size is thoroughly dry and pumiced, a layer or coating of paint is put on with steel trowels like those used by plasterers. Yellow ochre is much used for this thick coating, which if unaided by artificial heat sometimes takes fourteen days to dry. A second coat is applied in the same manner to finish the back, but the face receives five or six trowel coats, the surface being once or twice pumiced between the coats. The wearing surface receives a coat of paint with a brush if some other colour than that of the last trowel coat is wanted for the ground shade. In the case of cheap oilcloths, the coats of paint, instead of being applied by trowels, are put on by a roller machine. A man keeps pouring the prepared paint out of a bucket on the moving canvas, and a long blunt knife-blade, almost touching its surface, regulates the thickness of the coat of paint. When made by this method, the oilcloth receives nine coats.

In printing, wood blocks are chiefly used, a separate one being required for each colour of the pattern. These are about 18 inches square, and the face is commonly made of pear-wood, with a pattern cut out by steel tools. There is an ingenious way of producing patterns on wood blocks by heated iron punches. Sometimes the raised portions of these printing-blocks consist of type-metal or brass. Figs. A, B, C, D (Vol. II. p. 645) of the article CALICO-PRINTING will give an idea of how the impressions from several blocks complete a pattern. Beside the printers there is a table upon which

are placed the colour-pads. Another table, padded with felt or flannel, supports the floorcloth, each pattern block, charged with colour, being applied by means of a small screw-press. A machine is in use for printing floorcloth which to a certain extent imitates hand-printing. The blocks which form the pattern are depressed by cans carried on shafts. Roller machines are not applicable to this kind of printing, because the paint would 'run' on a revolving surface. The durability of oilcloth depends very much on the length of time given for the paint to harden, and also upon its quality.

**Linoleum.**—The floorcloth called by this name suits the purpose for which it is made admirably, being lasting, comfortable, and noiseless when trod upon. Its wearing face consists chiefly of pulverised cork and oxidised linseed-oil, with smaller quantities of copra and kauri resin, all well mixed together, and made to adhere to canvas backed with size and pigment.

The chief operations in the manufacture of linoleum are based upon processes patented by F. Walton in 1860 (specification No. 209) and in 1863 (specifications No. 1037 and 3210).

Of these the more important are the preparation of the cork, the oxidising of the oil, the formation of the mixture of all the ingredients for the coating, and the application of this to the surface of the canvas. Pulverised cork, of which linoleum most largely consists, is obtained from waste cork-cuttings. These are exposed to the action of a series of toothed steel discs revolving on a shaft and working against steel plates, the ends of which have also teeth like those of a saw. By this machine the cork is reduced to the size of peas. It is afterwards ground with millstones.

The oxidised linseed-oil is produced by diffusing or 'flooding' the boiled oil in thin films upon the surface of long pieces of calico or scrim, placed in an upright position. This is repeated daily till the successive films of oil reach half an inch in thickness. It takes six or eight weeks to effect this, and the scrim with its many films is then called a skin. Owing to the injurious action upon vegetable fibre of the vapours given off during the oxidation of the oil the scrim becomes completely rotten. Even mineral substances are attacked by these vapours. The gain in weight shows that a large quantity of oxygen is absorbed by the boiled oil, and that a good supply of air in the oxidising buildings is therefore necessary. After being cut into small pieces the skins are ground by means of grinding-rollers. Care must be taken not to heap up the pulverised material, as in bulk it is very liable to char or ignite by the rapid oxidation of such particles as have not undergone this change previous to grinding.

A mixture is now made consisting of from 4 to 8 cwt. of the oxidised oil to 1 cwt. common resin and 1 cwt. kauri resin, the mixing operation being conducted in a pan with an outer jacket or casing containing steam. The pan has an air-tight lid, and at a valve at the bottom and inside there are stirrers. Resin is first put in and melted, the oil and kauri being separately added. As soon as the mixture is warmed the steam is shut off, the oxidation of the materials keeping up a sufficient heat till the charge becomes homogeneous. The valve at the bottom of the pan is then opened, and the mixture, now called cement, passes down between grinding-rollers. The cement is next cooled, but before mixing it with ground cork it is again heated to at least 120° F. The proportions of these two ingredients are about equal, but sometimes the cork is rather in excess of the cement. The colouring materials (ochre and oxide of iron) are either added with the cork or previously to the cement.

There is still another mixing-machine—the most

important of all. Here the material is fed by a hopper into a cylinder in which both fixed and revolving knives are placed. It has a steam jacket. When the linoleum mixture leaves this machine, the cork and cement are so thoroughly mixed that they are scarcely distinguishable by the naked eye. The next operation is to pass the mixed material between two rollers, one of which is steam heated, and the other kept cool by a current of cold water. Here it is formed into a sheet, which is then broken up by a similar arrangement of rollers, one of them being studded with points for the purpose of breaking up the linoleum material into small pellets. Finally the mixture is spread over and pressed into the canvas by a pair of rollers of chilled cast-iron heated by steam to a high temperature. The canvas afterwards receives a backing of size and pigment, and then the linoleum is finished if it is to be left plain. When a pattern is required it is printed in the same way as upon oilcloth. A mosaic linoleum has been recently made in which the pattern is not merely on the surface, but the different colours which form parts of the design go through nearly the whole thickness of the coating of the canvas. The separate pieces or tessere are cut out of sheets of coloured linoleum by metal projections on a pattern block, and these pieces are made to adhere to a thin backing of linoleum fabric by some adhesive substance and pressure. This particular kind of linoleum is built up somewhat in the same way as a floor of coloured tiles. See patent specification, No. 6039, 1882, F. Walton.

*Kumputicon*, which is made of ground cork and india-rubber, was introduced earlier than linoleum, but its manufacture has almost ceased.

*Cork Carpet*, a flooreloth the manufacture of which has been quite recently begun. It is made of cork bound with oxidised linseed-oil, but differs from linoleum in having the particles of cork larger and purer in colour, as no pigment is mixed with it. It has a canvas backing, and is the warmest kind of flooreloth.

**Flora**, an ancient Italian deity, the Roman goddess of flowers and vegetable productiveness, also of exuberant youthful vitality. At Rome she had two temples, one on the Quirinal, the other near the Circus Maximus. On the occasion of her festival (*Floralia*), held in the end of April, the dwellings were decked with flowers, whilst feasting, with dance and song, prevailed everywhere. Flora was represented as a flower-crowned maiden in the full bloom of maidenly beauty.—*Flora* is used botanically to designate the collective plants or vegetable species of a region, country, or district, cryptogamic as well as phanerogamous, or to any work containing a descriptive enumeration of these.

**Florence** (Ital. *Firenze*), a city of Italy, capital of the former duchy of Tuscany, is situated in the valley of the Arno. It is about 123 feet above the level of the sea, 194 miles NW. of Rome, 62 E. of Leghorn by rail. Pop. (1881) of town, 132,039; of commune, 169,001 (in December 1888, 178,342). The Arno, spanned by four fine bridges, divides the city into two unequal parts, the chief on the northern bank of the river. Beyond the line of the ancient walls are chiefly peopled suburbs, and a lovely, fertile, and salubrious neighbourhood, encircled by sloping hills, and studded with pictur-

esque villas and fruitful vineyards and gardens. Florence and its environs, viewed from the heights of Fiesole, appear but one vast city. The influx of population consequent on the establishment here, in 1864-65, of the seat of the Italian government, necessitated a considerable extension of the city, and it is now nearly double its former extent. The ancient walls of the city have been razed; but several of the old towers pertaining to the various gates are retained, and constitute an interesting historical feature of modern Florence and a useful topographical indication of the former limits of the city. Many improvements and embellishments have been effected in the Florence of our day, and amongst these none ranks higher than the magnificent carriage-way known as the Viale dei Colli. It ascends from the Porta San Niccolò to the historic church and cemetery of San Miniato, and gradually slopes down to the Porta Romana. From the highest level of the drive, the Piazza Michel Angiolo, the panorama of Florence, the Arno, with the surrounding hills and distant Apennines, is quite unique for beauty and variety of scenery. Fine new streets, which stretch along the Arno, also add much picturesque attraction to the town, and the hygienic conditions of Florence have been greatly improved by the thickly planted avenues which encircle the greater part of the city, by the opening of several spacious squares, and by the erection of extensive new market-halls. Many causes render this city a most attractive place of residence to foreigners—a lovely country and healthful climate, cheap living, and the universal courteous intelligence of the people, united to the immense sources of interest possessed by the city in her grand historical monuments and collections of art.

The massive and austere forms of Florentine architecture impart an air of gloomy grandeur

Florence—the Cathedral and the Palazzo Vecchio—from the Palazzo Pitti.

to the streets, for the most part regular and well kept. The chief building in the city is the Duomo, or Cathedral, the foundations of which were laid with great solemnity in 1298; while in 1887 the completed façade was uncovered amidst equal pomp and ceremonial in the presence of the Italian sovereigns. The Florentines having ambitiously resolved on erecting a monument which for architectural splendour and proportions should outvie all preceding structures, the honour of preparing the design was entrusted to Arnolfo di Cambio. On his death Giotto superintended the

works; and many eminent architects were employed before this splendid edifice was completed. Brunelleschi, the last, conceived and erected the grand dome, so much admired by Michael Angelo as to have served him as model for that of St Peter's. The church contains sculptures by Ghiberti, Luca della Robbia, Michael Angelo, Sansovino, Bandinelli, and other famous artists. At the side of the cathedral springs up the light and elegant Campanile (q.v.), detached, according to the custom of the times. In front is the Baptistery of San Giovanni, in form an octagon, supporting a cupola and lantern; all three edifices being entirely coated with a varied mosaic of black and white marble. Three bronze gates in bas-relievo are a great additional adornment of the Baptistery; the two by Ghiberti (q.v.) have been immortalised by Michael Angelo, with the name of Gates of Paradise. The church of the Santa Croce, the Pantheon of Florence (built in 1294—architect, Arnolfo), contains monuments to Galileo, Dante, Machiavelli, Michael Angelo, Alfieri, &c. The church of San Lorenzo was consecrated as early as 393 by St Ambrose, and rebuilt by Brunelleschi in 1425, by command of Giovanni and Cosmo de' Medici. It contains an interesting monumental memorial of Cosmo il Vecchio, bearing inscribed the title *Pater Patriæ*, which had been conferred on his memory by public suffrage the year following his death. In the *Nuova Sagrestia*, or New Sacristy, are the two famous monuments by Michael Angelo to Julian and Lorenzo de' Medici. The Medicean chapel, gorgeous with the rarest marbles and most costly stones, agate, lapis lazuli, chalcidony, &c., stands behind the choir, and contains the tombs of the Medici family and their successors of the House of Lorraine. Annexed to the church of San Lorenzo is the Laurentian Library, with its inexhaustible store of rare MSS., founded by Giulio de' Medici. The beautiful church of Santa Maria Novella, formerly Dominican, dates from 1278 to 1360, and has famous frescoes by Cimabue, Orcagna, Filippino Lippi, and Ghirlandajo. The church of San Marco dates from 1436; adjoining it is the former monastery of San Marco, now secularised as the Museo Fiorentino di San Marco. Fra Angelico, Savonarola, and Fra Bartolommeo were inmates, and it is still adorned with the famous frescoes of Fra Angelico.

Amongst the numerous palaces *Il Bargello*, long a prison, but now restored and opened as a national museum, is one of the most ancient, and was formerly the abode of the republican magistrate, the Podestà. In 1841 some interesting portraits were brought to light by the removal of a coating of whitewash from the revered features of Dante, Brunetto, Latini, Corso Donati, &c., in the chapel of the palace. The Palazzo Vecchio, the seat of the republican government from its establishment till its abolition in 1530, is an imposing mass of building, surmounted by a lofty tower 260 feet high, the great bell of which used to warn the citizens of danger or summon them to defence. Adjoining the palace is the Palazzo della Signoria, a square containing a fine collection of statues, and a noble arcade, the Loggia dei Lanzi, under the porticoes of which are magnificent groups of sculpture. In one of the halls of the Palazzo Vecchio there now stands a colossal statue of Savonarola a few paces distant from the spot where the reformer perished at the stake. The Palazzo degli Uffizi is a handsome building adjoining the Palazzo Vecchio, founded by Cosmo I., in the first floor of which are deposited the archives of the court of justice and other public offices, also the Magliabecchi Library, now united with that of the Pitti Palace to form a national library of 200,000 volumes and 10,000

MSS. On the second floor, in a circular suite of twenty-three rooms, is contained the famous Florentine gallery of art; rich in paintings, engravings, sculpture, bronzes, coins, gems, and mosaics. A splendid apartment, known as the Tribuna, contains the rarest treasures of the collection. The Palazzo Pitti, formerly the grand-ducal residence, boasts of a superb gallery of paintings. Behind it are the beautiful Boboli Gardens, royal, but accessible to the public. The Palazzo Riccardi, now public property, is the residence of the prefect. The Palazzo Strozzi is a fine type of Tuscan architecture. Florence abounds in other public edifices and monuments, too numerous to mention, and there are several fine libraries besides those already named.

Since Italy has become a united kingdom, Florence, in common with the other cities of the country, enjoys a greatly improved educational organisation. Although not in possession of a university, the Florentines have the advantage of several superior and special educational institutions. The foremost of these, the Istituto di Studi Superiori, has adopted the ordinary university curriculum, and confers various degrees. Its success has been largely due to the able and enlightened direction of Italy's chief historian, Professor Pasquale Villari. The School of Social Science was founded by the Marchese Alfieri di Sostegno. In the Museum of Natural History medical students derive exceptional advantage from the admirable anatomical wax models of Susini; and, since 1871, in the same museum a most interesting collection of Galileo's instruments has been placed. Florence contains also a good school of art and a musical institute.

The hospital of Santa Maria Nuova contains an ancient college of medicine and surgery. The Academy of the Fine Arts and the Museum of Natural History afford unlimited resources to the public interested in their collections. There are three hospitals, one lunatic asylum, nine theatres. The Academy della Crusca (see ACADEMY) is entrusted with the care of sifting and preserving uncorrupted the Italian language. The Academy dei Georgofili was established in the interests of agriculture. Florence is the see of an archbishop, the seat of a prefecture and of numerous provincial courts, as well as the military headquarters of the district. Its railway communications are ample. The chief industrial occupations of the Florentines are the fabrication of silk and woollen textures, and of straw-plaiting for hats, &c., jewelry, and exquisite mosaics in rare stones. The Florentines are famous for their caustic wit and natural gifts of eloquence, as well as for their shrewd thriftiness and unflagging labour. In their moral superiority may be recognised the effects of a better and more upright government than those which existed in most parts of the peninsula previous to the recent union of Italy.

*History.*—The city of Florence sprang originally from Fiesole (q.v.), at the foot of which it lies extended. The inconvenient and hilly site of the Etruscan Fiesole, perched on the crest of an irregular height, rendered that town so difficult of access to the traders who resorted to its market-places with their varied merchandise that it was at length decreed they should assemble at the base of the hill, in the fertile plain traversed by the Arno. The few rough shelters erected for the accommodation of these traders may be considered the original nucleus of the important and splendid city of Florence. It would seem that as early as the time of Sulla there was a Roman colony here; another was established after the death of Julius Cæsar, and it soon became a thriving town. The *Florentini* are mentioned by Tacitus, 16 A.D., as sending delegates to Rome, but

it was not till the time of Charlemagne that Florence began to rise out of obscurity. It was now governed by a political head with the title of Duke, assisted by various subordinate officers, who were elected by the united suffrages of the duke and citizens. In the 11th century Florence and a great part of Tuscany were bequeathed to Pope Gregory VII. by his friend and partisan the Countess Matilda, who inherited from her mother, the Countess Beatrix, her jurisdiction over the city. Under the protection of Rome, Florence speedily adopted the forms and institutions of a free city; and the republican spirit which then arose amongst the people imparted an impulse to national life, and awoke a spirit of patriotism and enterprise. As early as the 11th century the Florentines were European traders and the possessors of commercial depôts in the seaports and cities of France and England, and their skill as workers in gold (see FLORIN) and jewels had grown famous. The 'arti' or trade-guilds were of great importance. In proportion as papal preponderance increased in Florence, that of the empire sunk; and in 1113 the citizen forces routed the troops and slew the delegate of the emperor at Monte Cascioli, near Florence. During the bitter wars between pope and emperor which raged throughout Italy, Florence and all Tuscany seemed to have been saved from the fends of Guelphs and Ghibellines—the former adherents of the papacy, the latter of the empire. But in 1215 Florence became involved in the great party struggle, owing to a private feud breaking out between two noble families, chiefs of the contending principals. A Guelph noble, Buondelmonti, mortally incensed the Ghibelline family of the Amidei, by breaking off his alliance with a daughter of their house, and contracting marriage with a member of a Guelph family. To avenge this insult the Amidei appealed to their powerful kinsmen, the Uberti, and in fact to all the Ghibelline party of Florence. Buondelmonti was stabbed to death as he crossed the Ponte Vecchio, and was speedily avenged by the Guelphs in the blood of his enemies. Thus for thirty-three years was Florence distracted by the deeds of bloodshed and violence of these two rival factions, who assumed the names and adopted the respective causes of Guelphs and Ghibellines. See GUELPH and GIBELLINE.

In 1250 the animosity of these parties seemed somewhat blunted, and public attention was directed to wise internal reforms. Twelve magistrates, or anziani, were appointed in place of the consuls, each of the six sections into which the city was divided being entrusted to two of these magistrates, whose tenure of office was annual. To avoid all local dissensions, two other magistrates, strangers by birth, were elected: the one, invested with supreme authority in civil and criminal cases, was called the podestà; the other, with the title of captain of the people, had the chief command of the militia, in which were enrolled all the youth of the state, who were bound, at the call of this magistrate, to join their company fully equipped for fight: twenty companies defended the town, ninety-six the country. After the death of the Emperor Frederick II., the great protector of the Ghibellines, the Guelph or papal party gradually rose in power in Florence, and during ten years of their predominance the city increased in grandeur and prosperity, until it stood not only the first in Tuscany, but one of the first of all Italy. Its forces successively humbled the adjoining towns of Siena, Arezzo, Pisa, and Pistoia, and in 1254 captured Volterra. In 1260 the standard of civil war was again raised by the Ghibellines of Florence, who, in league with Manfred of Naples, attacked the Guelphs, and cut their forces to pieces in the sanguinary battle of Monte Aperto. The

conquerors entered Florence forthwith, and in the name of Manfred abolished all trace of the popular institutions, establishing an exclusively aristocratic executive; they even strongly advocated the entire destruction of the city, the hotbed of Guelphism. This barbarous scheme was indignantly repudiated by their own famous leader, Farinata degli Uberti, immortalised by Dante for his patriotism. He even declared his intention of heading the Guelphs, were such a sacrilege perpetrated by his own party.

Pope Urban IV., French by birth, summoned against the Ghibelline Manfred a French army, led by Charles of Valois, to whom he offered the prospective kingdom of the Two Sicilies. Manfred was defeated and slain in the famous battle of Benevento, and Guelph ascendancy was restored anew throughout Italy and Florence. Charles fully restored to the Florentines their internal institutions, and received their offered allegiance for ten years in 1266. In 1282 the *Priori*, a new executive power, was established in Florence; and in 1293, by the consent of the *Priori*, a higher chief than their own order was elected, with the title of *Gonfaloniere*. In 1300 Dante became one of the *Priori*, and the former feud was recommenced with new vigour between two factions, who now bore the names of Bianchi (Whites) and Neri (Blacks). Their dissensions were, however, interrupted by the appearance of Charles of Valois, sent by Boniface VIII. to restore tranquillity, in 1301. Charles espoused the part of the Guelphs or Neri, and sanctioned every outrage on the Bianchi, who were plundered and murdered barbarously, the survivors being exiled and beggared; among these were Dante and Petrarco dell' Ancisa, the father of Petrarca. In 1306 Pistoia was besieged and taken by famine with great barbarity. In 1315 the Florentines met with a severe check from the Ghibellines of Pisa, under the command of Uguccone della Fagginola; and in 1325 they were completely defeated by Uguccone's successor in command, the valiant Castruccio Castracani, in the battle of Altopascio. Florence, weakened by long dissensions, and alarmed by Castruccio's threat of marching on the city, appealed to the king of Naples for aid. They received joyfully an officer of the king, entitled the Duke of Athens, sent as viceroy; and, such was the public demoralisation of the moment, they proclaimed him dictator of the republic, unanimously suppressing the offices of *priori* and *gonfaloniere*. The intrigues of this ignoble schemer to overturn the republic being discovered, he was ignominiously expelled by a general popular rising, and barely escaped with his life. An attempt to admit a proportion of the nobles into the government signally failed at this time, and only led to renewed animosity between them and the citizens. This was the last effort of the nobles to secure power.

A terrible pest decimated Florence in 1348, sweeping off 100,000 inhabitants (see BLACK DEATH). The chief power of Florence about this time seems to have been alternately wielded by the democratic families, the Alberti and the Rici, and by their patrician rivals, the Albizzi, who for the space of fifty-three years guided the republic in the path of progress. In 1406 the ancient and illustrious republic of Pisa (q.v.) fell under the sway of Florence, after a heroic resistance. From 1434 the history of Florence is intimately bound up with the House of Medici, distinguished for their patronage of art and literature—especially Lorenzo the Magnificent (see MEDICI). The Medici were repeatedly banished from Florence for aiming at sovereign power; and to their intrigues Florence owes her final loss of republican rights and institutions. The extraordinary labours of Savonarola (q.v.), his trial and

execution at the stake, belong to the last decade of the 15th century. Pope Clement VII., of the House of Medici, formed a league with the Emperor Charles V., by which the liberties of Florence were to be extinguished and the sovereign power to be invested in Alexander de' Medici. In September 1529 an army of imperialists, under the Duke of Orange, entered Tuscany; and on the 8th August 1530 the siege of Florence terminated, after a defence of unexampled devotion and bravery on the part of the citizens.

Thus fell the name and form of the republic of Florence, quenched in the best blood of the city. From this period Florence loses her distinctive history, and is only known as capital of the grand-duchy of Tuscany, Pope Pius V. having conferred on Cosmo de' Medici the grand-ducal dignity. On the extinction of the Medici in 1737, Tuscany fell to the Duke of Lorraine; and in 1808 was given by Napoleon to his sister Elise. Florence continued to be the seat of the grand-ducal court until 1859; and after the constitution of the united kingdom of Italy the city held the position of provisional capital of the country from 1864 until 1871. The departure of the court gave for a time an inevitable check to the prosperity of the town. Some idea of the splendour of Florence as a republic may be gathered from the facts that her capitalists were so enormously wealthy that they supplied the chief sovereigns of Europe with funds; her manufactures of wool, silk, and gold brocade were exported throughout the world; and she possessed great commercial establishments in all the countries of Europe.

In art Florence holds a unique place: the Florentine school of painting, from Cimabue to Andrea del Sarto, is admittedly the most important in Italy. In Italian literature the position of Florence is only hardly less conspicuous. Florentine eminence is attested by the names of Florentine worthies such as Dante and Boccaccio; the painters Cimabue, Gaddi, Orcagna, Masaccio, Ghirlandajo, the Lippi, Andrea del Sarto, Carlo Dolce; the sculptors Luca della Robbia, Donatello, Ghiberti, Bandinelli, Cellini; the architect Brunelleschi; the musicians Lully and Cherubini; Machiavelli and the historian Guicciardini; the navigator Amerigo Vespucci; the Medici, &c. Through the works of its writers the Florentine Italian, not that of Rome, became classical.

See the articles MACHIAVELLI, DANTE, BOCCACCIO, SAVONAROLA, MEDICI, &c., and works quoted there; the histories of ITALY and of PAINTING; Capponi, *Storia della Repubblica di Firenze* (1875); Perrens, *Histoire de Florence* (5 vols. 1877-80); T. A. Trollope, *History of the Commonwealth of Florence* (4 vols. 1865); Mrs Oliphant, *The Makers of Florence* (1876); Yriarte's great illustrated work, *Florence* (1880; Eng. trans 1882); A. J. C. Hare's *Florence* (1884); Ruskin's *Mornings in Florence*; and George Eliot's *Romola*.

**Florence of Worcester**, a chronicler of whose life nothing is known beyond the fact that he was a monk in the monastery of Worcester, where he died in 1118. His *Chronicon*, which comes down to 1116, in its earliest part is scarce more than a compilation from the Saxon Chronicle and Marianus Scotus; but about the year 1030 it becomes of greater value as an independent authority, meriting the approbation of Mr Freeman. It was edited by Benjamin Thorpe for the English Historical Society (2 vols. 1848), and translated by Forester (1847) and Stevenson (1853).

**Flores**, the name of two islands. (1) One of the Sunda islands in the East Indies, lying due south from Celebes. It is of an oblong shape, with an area of 6026 sq. m., is heavily timbered, and mountainous in the interior, forming, in fact, an eastward continuation of the Sumatra-Java volcanic

girdle. The western half, called Mangarai, is subject to a native chief; the eastern half, known as Endeh, belongs to Holland. Pop. 250,000. Trade, principally in tortoiseshell, cinnamon, sandalwood, and edible birds'-nests, is almost exclusively in the hands of Bugis (see BOXI).—(2) An island of the Azores (q.v.).

**Flores**, JUAN JOSE, first president of Ecuador, was born in Venezuela in 1800, and fought with distinction through the long war of independence. He was elected president of the new republic in 1830, resigning in 1835, and was re-elected in 1839 and 1843. He died in 1864.—His son, ANTONIO, born at Quito in 1833, was minister at Washington in 1860-64, and again in 1884-88, acting also, during the latter period, as ambassador to France and (in 1887) to Great Britain and Belgium. He was elected president of Ecuador in 1888.

**Floret**, a term applied to the flowers of any small and closely-crowded inflorescence which resembles at first sight a single flower—e.g. composites, teasels, scabiouses, grasses, &c.

**Florian**, JEAN PIERRE DE, a French novelist and fabulist, who was born in 1753, and died in 1794. He was a literary pupil of Voltaire, by whom he was held in very high esteem. He wrote two prose romances (*Numa Pompilius* and *Gonzalve de Cordoue*), and a number of pastorales, nouvelles, plays, and fables. He appears to most advantage in his *Fables*, which are neatly and often wittily turned. His romances are cold and languid in interest; they are fair examples, however, of the correct but colourless French prose of the 18th century.

**Floriculture**. See FLOWER, GARDENING.

**Florida** ('Land of Flowers') is a large peninsular state in the extreme south-east of the United States, bounded E. by the Atlantic Ocean, N. by Georgia and Alabama, and W. by the Gulf of Mexico. It lies in about 25°–31° N. lat. and 80°–87° W. long. The state is nearly 400 miles in length, and about 84 miles in mean breadth, its coast-line embracing about 1150 miles, and its area 58,680 sq. m., or 37,555,200 acres. About one-fifth of this area is water surface. Florida has nineteen navigable rivers, making an aggregate of 1000 miles; swamps and marshes are still extensive, and the lakes and isolated ponds number at least 1200. Of the lakes the largest is Okcechobee, a shallow fresh-water expanse of about 1000 sq. m., in the southern part of the peninsula; the Everglades (q.v.) form a delta-like expansion of this lake. No general survey of Florida has yet been made, but from a preliminary inspection the state geologist finds the formations to be the equivalent of the Tertiaries of the Paris and Thames basins. There are indications that there is an upheaval of the land still in slow progress; and this, together with the drainage operations, points to the possibility of at least a great part of the Everglades being reclaimed. The best bays, harbours, and estuaries are Fernandina, St John's River, St Augustine, Indian River, Key West, Caloosahatchie, Charlotte Bay, Tampa Bay, Cedar Keys, Deadman's Bay, Apalachee Bay, Apalachicola, St Andrew's Bay, and Pensacola Bay. The long coast-line is dotted with innumerable islands of all sizes, from Santa Rosa and Key Largo, 30 to 50 miles long, to the smallest possible sandy keys.

In climate and products Florida is like a great tropical island. It is cooled by delightful sea-breezes from the gulf, making the climate remarkably equable and healthful; and the state is a favourite winter-resort, both for tourists and invalids, although malarial fevers prevail in some

parts, and yellow fever has occasionally, as in 1839, visited the seaports heavily. Even in the southernmost portions the summer heat is not extreme. The range between the mean summer and winter temperature is only about 20°; but the observations published by the Signal Service present the recorded extremes as 105° and 10° F., showing a difference of 95°. The soil, while much of it seems a sterile sand, is helped to fertility by the moisture, the rainfall being about 54 inches annually. Florida furnishes abundantly the rich fruits and valuable products of the tropics. Large areas are devoted to orange orchards, while lemons, limes, grapes, pine-apples, bananas, pears, guavas, &c. grow with equal luxuriance; and coffee, rice, cotton, and tobacco are natural products. Sea-island cotton, so valuable, and elsewhere limited to a few islands, here grows far inland. Cocoa-nuts also are grown in the subtropical region. Horticulture is one of the most profitable pursuits, and of late years market-gardening has assumed considerable dimensions in many parts of the state. An abundance of fruits and vegetables may be had fresh every month in the year, and during the winter and early spring months they are in great demand in northern markets. Florida is not rich in minerals, but there may be found some iron ore, a little coal, peat, corals, silicified shells, oolite, amethyst, topaz, agate, carnelian, chalcodony, and calcareous limestone. The *coquina*, a shell conglomerate, furnishes an excellent building-stone; but concrete of sand, shells, and lime or cement is now more extensively employed, as in the vast hotel at St Augustine (q.v.). Mineral springs are numerous. Large tracts of alluvial swamp and shallow lake-lands are being reclaimed by drainage. Next to these are the low hummocks or bottom-lands, dry enough for cultivation, and producing large crops of cotton, sugar-cane, grain, fruits, and vegetables. The high hummocks have a dark, gray soil, very rich at first, but soon running out if not kept well fertilised. Then come first-class pine, oak, and hickory lands, sandy, but containing a good deal of lime. Oranges and other citrus fruits grow well on these lands. There is a second-class pine land that is barren, but supplies a tolerably good pasturage. The forest trees are live-oaks and other evergreen oaks, cypress, hickory, magnolia, holly, groat dogwood, bay-laurel, sassafras, lignum-vita, mahogany, palmettos, *Juncus* kina, mangrove, manchineel, torch-wood, &c. Figs are grown in great abundance. Indian corn is largely raised. Numerous wild animals abound in the central and southern parts of the state, such as the black bear, the cougar, the panther, wild-cats, wolves, foxes, raccoons, opossums, fish-otters, deer, and smaller game; alligators are found in nearly all rivers, lakes, and swamps; turtles are taken among the keys; and manatees are found on the Atlantic side as far north as latitude 27°.

Among the industries of Florida is a large business in the production of pine and other lumber, and live-oak timber for shipbuilding. The preparation of naval stores, turpentine, tar, rosin, and pitch employs many hands; cigars are manufactured in large quantities; all along the coast there are valuable fisheries, oysters abound in many parts, and the inland waters also teem with fish; and the evaporation of salt, the production of cotton-seed oil and meal, the manufacture of fertilisers, and sponge and coral fisheries are among the profitable industries.

During the latter half of the decade 1880-90 many capitalists and energetic northern men have invested and settled in Florida, contributing greatly to its wealth and the development of its resources. The assessments for taxation show a remarkable advance from \$32,794,383 in 1879 to \$86,265,662 in

1887. The state is traversed by numerous railroad lines, the principal of which are the Florida Railway and Navigation Company; the Florida Central and Peninsular; the Savannah, Florida, and Western; the Jacksonville, Tampa, and Key West; the South Florida; and the Florida Southern. The chief towns are Tallahassee (the capital), Pensacola, Apalachicola, Jacksonville, Fernandina, St Augustine, Tampa, Key West, Bartow, Orlando, Ocala, and Gainesville. There are forty-five counties of irregular shape, but many of the large ones are to be divided with the increase of population. In 1870 there were 187,748 inhabitants; in 1880, 269,493 (142,605 white; 126,888 coloured, including 18 Chinese and 180 Indians); in 1890, 391,422.

The common-school system is popular and efficient. There are over 2000 public schools, and the enrolled pupils in 1887 numbered 82,453. There are numerous institutes and colleges, including the State College at Lake City, which is endowed by the United States, and offers free tuition.

Florida was discovered on Easter Day (*Pascua Florida*), 1512, by Juan Ponce de Leon (q.v.). In 1539 it was explored by De Soto (q.v.), and in 1565 a body of French Calvinists, who had established a settlement three years previous, were butchered or driven out by the Spaniards. The latter held possession till 1763, when Florida was ceded to England in exchange for Cuba. The Spanish regained the country in 1781, and two years later were confirmed in their occupation by the Peace of Versailles. Florida was ceded to the United States as a territory in 1819, received a constitution in 1833, and was admitted into the Union as a state in 1845. In 1835-42 it was the theatre of a desperate war between the aborigines (Seminoles, q.v.) and the white settlers, a war which was only terminated after a sacrifice of hundreds of lives, and at a cost to the United States government of over \$20,000,000. Florida passed an ordinance of secession, January 10, 1861, siding with the Confederates; but the battle of Olustee in February 1864 was the only important fight within its boundaries. It was one of the first states to return to the Union, framing a new constitution in October 1865, but was not re-admitted till June 1868. It is represented in the United States senate by two members, and in the House of Representatives also by two. See Davidson, *The Florida of To-day* (1889); Whitehead, *The Campfires of the East* (1891); Powell, *The American Siberia* (1892).

**Florida**, capital of the Uruguayan department of the same name, 67 miles N. of Montevideo by rail. Pop. 2500.—The department has an area of 4650 sq. m., and a pop. (1886) of 26,411.

**Florida Strait** is the name given to the channel separating the American state of Florida from Cuba on the S. and the Bahamas on the E. It is 310 miles long, and varies from 50 to 100 miles in width, and from 2220 to 5070 feet in depth. The Gulf Stream flows through the strait at a rate varying from  $\frac{1}{4}$  mile to 5 miles an hour.

**Florin** was the name of a gold coin first struck in Florence in the 11th century. It was the size of a ducat, and had on one side a lily, and on the other the head of John the Baptist. The silver florin, with the same designs as the gold florin, was first struck in 1181. These coins were soon imitated all over Europe. It was out of them that the German gold and silver gulden of the middle ages and the silver gulden of modern times arose. These last are still marked with the letters *FL*. The gulden or florin is the unit of account in Austria, and has a value of about 2s. Till 1876 a florin or gulden of 1s. 8d. was the unit in the South German

States. The Dutch florin or guilder is also worth 1s. 8d. The English 2s. piece is called a florin; the 4s. pieces first coined in 1887 are double florin.

**Florio**, JOHN, the translator of Montaigne, was born in London about 1553. His father was a Protestant exile and Italian preacher in London, but his labours came to a discreditable conclusion. Wood says that for safety's sake he kept his family out of England till after the death of Mary. John Florio appears as a private tutor in foreign languages at Oxford about 1576, and two years later published his *First Fruits, which yield Familiar Speech, Merry Proverbs, Witty Sentences, and Golden Sayings*, accompanied by *A Perfect Induction to the Italian and English Tongues*. In 1581 Florio was admitted a member of Magdalen College, and became a teacher of French and Italian. He enjoyed the patronage successively of Leicester, the Earl of Southampton, and other noble persons. His next work was *Second Fruits, to be gathered of Twelve Trees, of divers but delightful Tastes to the Tongues of Italian and English men*, with, annexed to it, the *Garden of Recreation*, yielding six thousand Italian Proverbs (1591). His Italian and English dictionary, entitled *A World of Words*, was published in 1598. Florio was appointed reader in Italian to Queen Anne, and afterwards groom of the privy-chamber. In 1603 he published in folio his famous translation of Montaigne, of which it is praise enough to say that it is a version worthy of its original. A copy of this work in the British Museum bears the authentic autograph of Ben Jonson; another, that of Shakespeare, although its authenticity is more than dubious. At any rate it is certain from the *Tempest* that the great dramatist was familiar with the book. It was long believed that the pedantic Holofernes in *Love's Labour's Lost* was a study after Florio; but it is satisfactory to lovers of Montaigne to know that for this there is no foundation. Florio died of plague at Fulham in 1625. Second and third editions of his Montaigne appeared in 1613 and in 1632. A reprint of the first of the three books of this noble monument of Elizabethan English was issued in the 'Stott Library' (1889).

**Florists' Flowers.** See FLOWERS (FLORISTS').

**Florus**, generally, but on insufficient evidence, called L. Annaeus Florus, was a Roman historian who flourished in the reign of Trajan or Hadrian, but of whose life we know nothing. He wrote an epitome of Roman history (*Epitome de Gestis Romanorum*), based mainly on Livy, from the foundation of the city to the time of Augustus, in an inflated and metaphorical style. The best edition is that of O. Jahn (1852), as revised by C. Hahn (1854). See the books by Sprengel (1861) and Reber (1865).

**Flory.** See FLEURY.

**Flotow**, FRIEDRICH, FREIHERR VON, an operatic composer, born at Teutendorf in Mecklenburg, 27th April 1812. He was at first intended for the diplomatic profession, but on his arrival at Paris in 1827 his sense of his own musical abilities was awakened, and he began to study under Reicha. His reputation was made by his earliest operas, *Le Naufrage de la Méduse* (1839), *Stradella* (1844), and *Martha* (1847), the last two characterised by pleasing melody and by the light and lively character of the music. Of Flotow's later operas only three have attained marked success—*Indra* (1853), *La Veuve Grapin* (1859), and *L'Ombre* (1869). In 1856 he was appointed intendant of the theatre at Selwerin; but this position he resigned in 1863, and returned to Paris. He died at Wiesbaden, 24th January 1883.

**Flotsam**, JETSAM, and LIGAN, terms of English law used to denote goods cast away from a ship

that is wrecked or sunk. *Flotsam* is the term where the goods continue to float or swim upon the surface of the water; *jetsam*, where they are cast into the sea and sink; *ligan*, where they are sunk in the sea, but fastened to a cork, bladder, or buoy in order to be found again. Unless the owner appear to claim them within a year and day, goods in each of these states belong to the crown. *Jetsam*, *flotsam*, and *ligan* did not fall within the meaning of the term 'wreck' in its original meaning at common law. In that sense wreck was the part of the cargo of a lost ship that came to land and belonged to the crown. A grant of 'wreck' from the crown accordingly did not carry *flotsam*, *jetsam*, and *ligan*. At the present day, however, 'wreck' has come to include these classes of goods in the provisions of the Merchant Shipping Acts and other statutes. Statutory officers, called Receivers of Wreck, preserve wreck until it is claimed by the owner, or, if not claimed, sell it and pay the proceeds to the Exchequer. All such matters are under the general supervision of the Board of Trade. *Jetsam* must not be confounded with *jettison*, which means the throwing overboard of goods in order to save the ship, as where she must be lightened in a storm, or to gain speed to escape from capture, or for other good cause. In such a case the loss for the general good is apportioned by general average. See AVERAGE.

**Flounder** (*Pleuronectes fesus*), a common species of flat-fish, of wide distribution in the shallow waters round Britain and other north temperate countries. It is the Scotch 'fluke,' and the Swedish 'flundra,' and differs but a little from the plaice and dab, two of the commonest neighbour-species. Like other flat-fishes, the flounder is asymmetrical, and swims or rests on one side, almost always the left, the eye of which is in early youth brought round to the upturned surface. It measures about a foot in length, and about a third as much between the dorsal and the ventral edge, without including the fringing fins. The colour of the eye-bearing surface varies in sympathetic adaptation to that of the sandy or muddy bottom on which the fish lives. The upper side is olive-green or brownish, sometimes with yellow spots; the blind side is yellowish-white, with small, dark points. The mouth-aperture is narrow; the teeth are conical, and most developed on the blind side; the dorsal fin begins at the eye; the scales are minute and smooth, but rough tubercles occur on the side of the head and along the bases of the dorsal and anal fins.

Of the two dozen related species, the Plaice (*P. platessa*), the Dab (*P. limanda*), the Smear-dab (*P. microcephalus*), and the Craig-fluke (*P. cynoglossus*) are the commonest. In the soles (*Solea*) the dorsal fin begins in front of the eye, and the upper eye is slightly anterior to the lower.

The flounders spawn at the mouths of rivers, and the young are hatched in May. The fish often leave the sea and go up the rivers, ascending the Avon to near Bath, and the Moselle as far as Treves. They are even able to thrive in ponds. Sea-birds prey largely upon them, breaking the bones to make swallowing possible. Though inferior to the plaice, the flounder is an esteemed food-fish. See DAB, FLAT-FISH, PLAICE, SOLE.

**Flour.** See FOOD, and BREAD.

**Flourens**, MARIE JEAN PIERRE, a French experimental physiologist, was born on 15th April 1794, at Maureilhac, Hérault. After having obtained his degree of doctor of medicine at Montpellier at the early age of nineteen, he proceeded to Paris, where he soon became acquainted with the Cuviers, Geoffroy St-Hilaire, Desmets de Tracy, Chaptal, &c. He first attracted attention by a

series of works dealing with the nervous system in its relations to the different sensations, wherein he sought to determine upon experimental grounds the specific sensational functions of the cerebellum, cerebrum, and corpora quadrigemina. After lecturing for Cuvier in 1828 and 1830, he received a professorship in the museum of the Jardin du Roi, and in 1855 at the Collège de France. In 1833 he was nominated perpetual secretary of the Academy of Sciences, and in 1840 he succeeded Michaud in the Academy. He also took some interest in politics; he was elected to the Chamber of Deputies in 1838, and was made a peer of France in 1846. He died at Montgeron near Paris, 6th December 1867. Flourens also wrote instructive books on the development and nutrition of the bones, on the skin and mucous membranes, on the longevity of man, on animal instinct and intelligence, on the works of his predecessors and contemporaries, Buffon, Cuvier, Geoffroy St-Hilaire, and Darwin, and a series of useful *Éloges Historiques* (3 vols. 1856-62).—His son, GUSTAVE, born at Paris, 4th August 1838, first distinguished himself by his book, *Science de l'Homme* (1865), a series of lectures on the origin of the human race, delivered at the Collège de France in 1863. Of ardent republican sympathies, he took a very active part in the Cretan insurrection against the Turks in 1866, and subsequently in the Commune at Paris, fighting in behalf of which he met his death on 3d April 1871.

**Flower.** The observations of childhood, like the popular language in which these so largely tend to survive, are apt to deny flowers altogether to plants in which these are not conspicuous. Yet the unmistakable succession of the flower by the fruit and seed compels us in some measure to argue back from the presence of one or other of these to the previous existence of flowers, even where they may not usually have been noticed, as, for instance, in the oak. The observant walks of spring and early summer soon convince us that not one even of the soberest forest-trees but has its blossoming time, while no one can escape noticing in mid-summer the abundant blooms of the grasses and nettles. Horticultural experience, too, convinces us that the overpowering majority of plants brought from other lands flower sooner or later if the right conditions can be insured them, and thus we gradually reach the generalisation that among the plants which exhibit stems and leaves, none save the mosses, the ferns and horse-tails, the club-mosses and selaginellas, with a very few other inconspicuous and unimportant forms, fail to agree in the production of flower and seed. We have here evidently a broad principle of classification, and if our knowledge of the reproductive function of the flower has meantime developed so far as to repeat the discovery of its definite sexuality, we shall feel the appropriateness of Linnaeus's general term of *Evident-flowering* or *Phanerogamia* (q.v.), yet also approve the mingled caution and speculativeness which made him apply that of *Cryptogamia* (q.v.) to the latter, since it was reasonable to suppose that the reproductive process (*Gr. gamos*, 'wedlock') evident (*Gr. phaneros*) in the former might in the latter be concealed (*Gr. cryptos*).

The examination of so many flowers, or even of a few representative ones, will have shown us that the central organs in which the seed arises exhibit considerable variety alike in number and detail. Thus, distinguishing the essential 'seed-box' as the *ovary*, we find that there are many simple separate ones in the buttercup or the rose, while the apparently single ovary of the apple or the tulip turns out on section to be five- or three-celled respectively, each cell containing the future seeds or *ovules*. We find, too, above the ovary a surface usually viscid or hairy, to which pollen readily

adheres, and this we call the *stigma*, noting also that while sometimes practically sessile upon the ovary, as in buttercup or poppy, this is oftener raised upon a column, the *style*.

Encircling the seed organs we find the *stamens*, their stalks or *filaments* bearing heads or *anthers*. We see the latter shedding forth a yellow dust, the *pollen*, the same as that which we have noted upon the stigma of some of the flowers. This suggests one or two simple experiments. If we cut off the stigma, or cover it so that pollen cannot reach it, the incipient seeds or ovules will never mature into seeds proper capable of germination. Conversely, if we remove the stamens of this and other flowers, so that the same isolation of the stigmas from pollen comes to pass, the same failure of the seed follows. Whereas, when pollination of any particular stigma is effected (whether by the natural agency of insects or the wind, or more convincingly, by the actual help of the experimenter), seed forthwith matures in the corresponding ovary. And if the pollen be from a plant exhibiting some characteristic varietal difference, the resulting seed, when grown in its turn, will show the influences of this 'crossing' in a more or less marked degree (see *HYBRID*, *HEREDITY*). In this way the conception of sex in flowers, of immemorial date as respects those of the Date-palm (q.v.), has been extended in quite modern times. The carpels and stamens being thus the 'essential organs,' we recognise as merely 'accessory organs,' the parts lying external to these, despite their frequent conspicuousness and beauty. In both monocotyledons and dicotyledons we have usually two circles or *whorls* of these parts, but in the former they are usually very similar, and so are usually spoken of merely as inner and outer *perianth-whorls* respectively, and their parts as *perianth-segments*. In most dicotyledons the corresponding whorls are known as *corolla* and *calyx*, since the colour and magnificence of the blossom usually depend upon the former (*Lat. corolla*), while the latter is commonly reduced to a mere verdant cup (*Gr. calyx*). The parts of the corolla or *petals*, and those of the calyx (*sepals*) are hence usually recognisable at a glance, as in the buttercup or rose. Yet the corolla may be reduced to inconspicuousness, as in the Christmas rose or globe-flower, or even vanish altogether; while the calyx may assume splendours which would be noteworthy even for a corolla, witness the marsh-marigold or garden clematis. Petaloid characters may be even assumed by Bracts (q.v.). Sepals, and still more frequently petals, may become more or less completely *united*, as so familiarly in the common primrose. In monocotyledons both whorls of the perianth may unite, as in the lily of the valley. Peculiar specialisations of form also abound, especially in the corolla, witness pansy or balsam, dead nettle or snapdragon. The calyx, too, may have its peculiarities, as in wallflower or poppy. The very modes of their arrangement in the bud differ widely (see *ÆSTIVATION*); while the position and arrangement of the separate flowers opens up a new field of study (see *INFLORESCENCE*).

Applying to the essential parts corresponding collective names, we have then innermost of all the *pistil* or *gynæceum* (its separate or constituent members being termed carpels); next the *androeceum* of stamens. We have thus four whorls of organs, each presenting apparently independent and often wide differences in different flowers; hence we understand how in the attempt conscientiously to take note of all this multiplicity of floral detail the nomenclature of descriptive botany almost inevitably became so intricate and cumbersome (see *BOTANY*) as to obscure and retard that

very progress towards the recognition of the order and unity of the floral world which it was the aim of the whole science to reach. Keeping this aim, however, in view, we are compelled to rise from the description of separate plants to the problem of classifying them into groups (species, genera, orders, classes, &c.) according to the degree of their common resemblance. It soon becomes evident, as it did to the earliest systematists, that it is mainly upon the flowers that our classification must depend. And having seen the multifariousness of these, we are in a position to appreciate the aid of the Linnean or 'Artificial System' of orders and classes, when to ascertain or record all that is known of a new plant our primary task is but the simple one of noting the number of its carpels and stamens. We comprehend better, too, the reluctance with which the claim of the 'Natural System'—that classification must depend upon the sum of like characters—was conceded, since this principle leads us back to unravel all the perplexing intricacies of which the device of Linnaeus so summarily cut the knots.

A principle of fundamental importance for the natural system was however reached, and descriptive botany made a vast step, from the empirical to the rational level, as the conception of the morphology of the flower (see MORPHOLOGY) became gradually established. Sepals and petals, stamens and carpels thus lost their utter distinctness, and fell into a single category with the leaves as the *appendages of an axis*; their differences thus becoming understood as specialisations for their respective physiological purposes, in no way inconsistent with fundamental unity of structure and development. The simplest observer soon realises that a sepal is a sessile leaf, and a stamen a stalked one, and only needs to dissect a double rose or a white water-lily to convince himself by the discovery of a perfect series of transitional forms between petal and stamen of the essential unity of these. The spiral instead of whorled arrangement which we find in some simpler floral types (Ranunculaceae, &c.) is thus immediately intelligible as a transition to the ordinary phyllotaxis of leaves. But the botanist has hardly yet exhausted the more refined applications of this principle; thus, since a leaf may not only have stalk and blade, but side pieces or stipules, we have frequently to take note of these in the flower, just as in the analogous case of leaves reduced as bud-scales (see BUD). Nor does the utmost detail fail us: thus, since the stipules of opposite leaves, although normally separate (nettle), constantly tend to unite (wood-geranium) or may even develop like the ordinary leaves (bedstraw), so it happens in many flowers. What the descriptive botanist empirically termed the outer calyx or epicalyx of a strawberry or lady's mantle is thus rationalised as the united stipules of adjacent sepals; and similarly the perplexing whorl of external yet younger stamens in the Geranium (q.v.) and a few other types is easily interpreted as similarly united stipular developments of the ordinary whorl of stamens. By help of the leaf, in short, we are learning more and more completely to interpret and unify the peculiarities of floral structure.

Returning to simpler cases, the union of sepals and petals not only recalls that of opposite leaves, but anticipates what we exceptionally find among stamens, as in the filaments of the mallows, or the anthers of the composites; or among the carpels in a majority of orders. That in the types with united corolla such union of the inner parts should also be more frequent and thorough than in those of separate parts is not to be wondered at; hence, for instance, the clubbed stigma of the lily of the valley as compared with the distinctly lobed—i.e. more separate stigma of the tulip.

Another great series of structural differences becomes cleared up when we bear in mind that appendages, however crowded and united, must arise upon an axis, however shortened. One or more internodes of the floral axis are, indeed, occasionally well developed, as in a lychnis or a passion-flower; but, generally speaking, their growth is checked at a quite embryonic stage. Since the early days of the natural system great attention has been paid to the position and origin of the floral parts. In the lily or the buttercup the stamens are seen to arise directly under the gynoecium, and are accordingly described as *hypogynous*; in the strawberry they arise in a circle at about the same level as the bases of the young carpels, and are consequently termed *perigynous*; while in the iris or the rose they seem perched upon the very top of the ovary, which is hence described as *superior*. From the distinctness of the floral axis (then termed *thalamus*), the orders of hypogynous dicotyledons with separate parts became grouped as *Thalamiflorae*, while those with perigynous or epigynous stamens and separate parts were termed *Calyceflorae*, from the apparent origin of the stamens upon what was commonly regarded as a united calyx. All this, however, becomes intelligible when we combine the study of vertical sections of the adult flowers with the facts of their development. In the simplest hypogynous type we see the whorls of floral appendages standing in regular succession upon the conical floral axis just as they developed; the internodes having all developed equally. In the perigynous type, however, we see that the growth of the upper portion of the floral axis has been outstripped by that of its lower and as it were more vegetative region, which hence grows up around it; the epigynous type thus being only the extreme case of this, just as in inflorescences the spike becomes flattened into a capitulum, and this finally hollowed at the apex, or rather raised at the circumference into a cup, or even flask, as in the case of the fig. See INFLORESCENCE.

The large body of dicotyledonous orders in which the petals were united were grouped as Corolliflorae, and finally the small and apparently degenerate types in which calyx, corolla, or both were absent were termed Incomplete. The convenience of this system is so great that it is still retained in the *Genera Plantarum* of Bentham and Hooker. Its importance, but also its dangers may be well seen by comparing fig. 1, in which figures of types of as many well-marked Thalamifloral, Calycifloral, and Corollifloral orders are paralleled within the single order Liliaceae (fig. 2), when with these we reckon the closely allied Amaryllids. In the same way the wide contrast between the usually splendid Calycifloral or Corollifloral and the inconspicuous Incomplete type might be paralleled within the range of a single order, witness rose and lady's mantle, or lilac and ash (Oleaceae).

Though thus losing an absolute principle of classification, we gain a conception of simplicity underlying floral differences. From the mere empirical description of flowers as we find them we begin to penetrate the rationale of their development, to comprehend something of what we may call the principles of flower-making. Starting again from a simple and tolerably central type like that of the lily, we find among its immediate allies types here of increasing floral magnificence, there of diminished splendour and size; witness tulip and lily of the valley. We see how the more magnificent types tend to be always few or single-flowered, while the smaller and more modest types bear flowers in abundance; how the former are more individualised examples of the ordinal type, while the latter seem more embryonic. The one type tends to be richly coloured, often

indeed complexly marked; the other tends to be paler, even white or positively greenish. When departures from regularity of form occur it is the more splendid forms which become bilaterally

Fig. 1.

a, vertical section of buttercup (*Ranunculaceae*), showing hypogynous arrangement (*Tritilliflorae*); b, cherry (*Rosaceae*), showing perigynous arrangement (*Calyceflorae*); c, bell (*Campanulaceae*), showing epigynous arrangement (here occurring along with the united petals of *Corolliflorae*). Each section is accompanied by its corresponding ground-plan or 'floral diagram.'

symmetrical; and conversely it is among the more embryonic types that the petals or other parts become united. The more vegetative habit of the lily of the valley as compared with that of the tulip is here of interest, since we can correlate this obvious constitutional difference with the facts already outlined, or with such an otherwise incomprehensible detail as the production of many ovules by the tulip, but of few by the more vegetative and consequently less reproductive blossom of the lily of the valley. Even were such facts comparatively isolated they would be suggestive; but a wider examination of the monocotyledons brings us face to face with the existence of the same contrast in groups of all extent. Those extreme types, as it would seem, at once of floral differentiation and of vegetative habit, which we know as grasses and orchids, are alike clearly referable to the simple liliaceous ground-plan of structure (see the floral diagrams in fig. 3), and the question hence arises—must we not regard these simply as extreme variations, greater in degree, but of no different kind than those which we have

Fig. 2.

a, vertical section of tulip, with parts all separate; b, narcissus, with inferior ovary; c, lily of the valley (*Convallaria*), with united perianth and adherent stamens. The floral diagram of the tulip, however, applies to all.

recognised among the *Liliaceae* proper? An examination of the orchids or the grasses themselves, still better of the arums, yields a similar result: the floral orchids have their degenerate vegetative types, small, many-flowered, few-seeded, it may be even green; while even the typically crowded and degenerate florals of the arums may recover, as we see by viewing the whole inflorescence, no small measure of floral magnificence. Passing to the

dicotyledons we find the same result in reviewing them order by order, often indeed genus by genus (e.g. *Clematis*, *Thalictrum*, *Delphinium*, and *Benedictum*). We thus comprehend the otherwise perplexing fact that of all supposed natural alliances it is that of the *Incomplete* which has most broken down, their 'orders' having long been recognised as the degenerate (i.e. vegetative) representatives of many widely distinct orders. The bearing of these considerations upon our theory of variation and consequently upon our general conception of evolution cannot here be entered upon: it must suffice if the existence of order and simplicity amid the infinitude of floral detail has been rendered more apparent.

The problems just now raised will be found more fully discussed under *VARIATION*, &c.; while the classification of flowering plants is more naturally treated under *VEGETABLE KINGDOM*. The structure of the stamens, with the development of its pollen, are naturally described under *STAMEN*, and the process of fertilisation of the ovule under *OVULE*; while that deepest interpretation of the flower which compels us to view the phanerogam as not only the most evolved of the cryptogams, but really the most profoundly cryptogamic of them all, is necessarily given under *GYMNOSPERMS*, since a knowledge of these in relation to the higher

Fig. 3.

a, floral diagram of *Liliaceae*; b, reduced modification of this usual in Grasses (q.v.); c, specialised modification usual in Orchids (q.v.).

cryptogams is indispensable. It remains, however, to glance briefly at the flower from the physiological side, in its adaptations to fertilisation.

*Fertilisation of the Flower.*—From the frequent separation of the sexes in flowers borne upon the same individual (*monoecism*—e.g. *Begonia*), or upon different individuals (*dioecism*—e.g. nettle, dog-mereury, red or white campion), it is evident that pollen must somehow be borne from male to female flowers. The artificial assistance of the wind-fertilised Date-palm (q.v.) has been already referred to as indicating some comprehension of the process from immemorial times. The hermaphroditism of most flowers, however, long misled botanists into thinking of the flower as normally fertilised by its own pollen; and so obstinate was this error that even the publication of Sprengel's *Secret of Nature Discovered*, with its wealth of careful observation even supported by accurate figures, failed to dispel it (see *BOTANY*); and this admirable book fell into oblivion until its rehabilitation by Darwin, followed by Delpino, Hildebrand, Fritz Müller, and many subsequent investigators.

Just as the familiar spores of ferns or horse-tail are scattered by the wind, so it is with the pollen of such primitive flowers as those of Conifers and Cycads (see *GYMNOSPERMS*). In the cryptogams, however, germination of the spores takes place upon the ground apart from the parent plant altogether; but in the flower, since the female spore or embryo-sac remains retained within its sporangium or ovule, and this in turn in monocotyledons and dicotyledons (angiosperms) within a carpellary leaf which usually does not even open until the maturation of the fruit (see *FRUIT*), it is manifest that only those male spores (pollen grains) can be effective which are conveyed to the receptive surface (stigma) of the carpellary leaf, and there-

germinate until they succeed in penetrating as far as the ovule and embryo-sac. Hence the utility of wind or insects for the transport of pollen. In this regard it is evident that the help of spore-eating insects might early have been of service, since spores might readily thus be conveyed adhering to their bodies. It has been already noted (see CHLOROPHYLL) that the colouring matter of flowers, like that of vernal and autumnal leaves, must be associated with phases in the constructive or destructive changes of chlorophyll. Since the reproductive process especially checks those of vegetation, we have here an agency for the production of floral colour, which, by rendering the reproductive shoots more conspicuous to insects, would be constantly aided by natural selection. Upon the latter process, indeed, the customary explanation of the origin of floral colour and markings solely depends. An analogous advantage for the attraction of insects would be given by the overflow as 'nectar' of any excess of the sugary sap so largely used up by the flower itself, or similarly by the disengagement of perfume. A constant adaptation between flower and insect being in such ways established, further specialisations arise. Thus, while in many flowers—e.g. crucifers, the stamens and stigmas are ripe simultaneously, a 'want of time-keeping' is frequently observed, the stamens becoming *protandrous*—i.e. ripening before the stigmas, as typically in *Geranium* (q.v.), so that self-fertilisation is impossible, and a physiological separation of the sexes (*diechogamy*) is thus insured. Or where the ripening remains simultaneous, two or even three forms of flower (*dimorphism*, *trimorphism*) may occur in different individuals of the same species, so rendering cross-fertilisation by insects indispensable (see PRIMROSE, LOOSESTRIFE). The individual flower may also become peculiarly specialised: thus, the nectary may become so deep as to be accessible only to insects with long proboscis, as bees to the exclusion of flies, butterflies and moths to the exclusion even of bees, it may be even to some particular species only. Birds, too, may replace insects (see HUMMING-BIRD, HONEY-BIRD). Mechanical adjustments are also to be found in many of the more specialised types, witness the stamens of the sage, which are rocked forward by the bee on entering the flower so as to dust his back with pollen just where it will be rubbed off upon the stigma of the next flower. The most extraordinary variety and complexity is, however, that presented among the Orchids (q.v.).

How some flowers (e.g. *Stapelia*, *Rafflesia*) attract the services of flesh-flies by the odour and even colour of carrion; how others like *Arum* and *Aristolochia* may entrap and detain the fertilising insect until well dusted with pollen, are examples which can but be mentioned. Nor can we describe the defences of flowers from rain or from ants, &c. (see, however, CATCHFLY, HEATH, &c.).

In wind-fertilised plants the flowers are usually comparatively small and inconspicuous, but numerous and closely aggregated, often in spikes, heads, or catkins; the floral envelopes are usually small and greenish; one or both whorls are indeed frequently absent (Incomplete). The stamens are few but often versatile as in grasses, the ovary redneel, commonly only one-seeded, but with one or more styles and stigmas, the latter often exuberantly branched or feathery, so catching the small, smooth pollen. The stigmas are ready before the pollen is shed (*protogynous diechogamy*); and flowering often takes place as in many forest-trees before the development of the leaves. The pollen grains may be lightened with air-sacs as in the pine, may be helped by gravitation as in maize or bulrush, where the male inflorescence grows higher than the female, or may be scattered

explosively as in the nettle or artillery plant. The utility of all these special characters of wind-fertilised flowers is thus no less obvious than that of the peculiarities of those dependent upon the visits of insects, and the natural selectionist is hence accustomed to draw from both of these remarkable sets of adaptations many of his strongest arguments for the development of even the most complex organic structures through the cumulative selection of minute spontaneous varieties (see DARWINIAN THEORY). Some facts, however, such as the repeated development of the character of wind-fertilised flowers in quite unrelated types, seem rather to indicate the possibility of a constitutional interpretation similar to that indicated on the previous page (see VARIATION).

It is thus manifest that the flowers of every species in nature thus invite and reward an observant interest far other than that of the mere collector, systematist, or even morphologist. Further information will sometimes be found under individual headings—e.g. CAPRIFICATION, GERANIUM, VALLISNERIA, &c.; these cannot, however, exhaust the special works upon the subject.

See, for general reference and full bibliography, Müller's *Fertilisation of Flowers* (trans. by Thompson, Lond. 1882); also Kerner's *Pflanzenleben*, Bd. ii. (Leip. 1889); and Hooker's *Students' Flora* (1888). Among popular introductions to the subject those of Lubbock and Grant Allen ('Nature' series, &c.) are well known.

**Flower**, WILLIAM HENRY, zoologist, was born at Stratford-on-Avon in 1831, served as assistant-surgeon in the Crimea, and afterwards became demonstrator of anatomy at the Middlesex Hospital. He was appointed in 1861 conservator of the Hunterian Museum, in 1869 Hunterian professor of Comparative Anatomy and Physiology, and in 1884 director of the natural history departments of the British Museum. In 1889 he presided over the meeting of the British Association at Newcastle. He is a Fellow of the Royal Society, LL.D. of Edinburgh and Dublin, and has written numerous memoirs connected with anatomy, zoology, and anthropology, as well as a work on the osteology of mammalia.

**Flower-de-luce**, the old name for the common species of Iris (q.v.), or for the heraldic emblem conventionalised therefrom. See FLEUR-DE-LIS.

**Flowering Rush** (*Butomus umbellatus*), a monocotyledonous plant usually reckoned under the order Alismaceae, easily recognised by its large linear three-edged leaves (which are said to cut the mouths of cattle, whence the Greek form of the generic name), and by its umbel of rose-coloured flowers, which Ovid tells us render the plant a special favourite of Flora. The bitter rootstock was formerly official, and was also used (as still in some parts of eastern Europe) as a source of starchy flour, and the leaves are sometimes plaited. It is not uncommon in ponds and wet places, and is well worth introduction where such conditions are present.

**Flower of Jove** (*Agrostemma flos-Jovis*), a pretty Caryophyllaceous plant, with heads of purple or scarlet flowers, and leaves silky white with hairs. Other species are common in gardens—e.g. *A. californica* (Rose of Heaven), and *A. coronaria*. The genus, also known as Rose campion, owes its technical name to the ancient use of the flowers in crowns and garlands.

**Flower-pots** are utensils of culture whereby plants are rendered portable at all seasons. They are used in one form or another in all countries where gardening as an art is practised. In Britain and on the Continent they are made in all sizes, from the *thumb-pot* of 2 inches in depth used for potting tiny seedlings and delicate cuttings, to extra large ones of 3 feet to accommodate

large palms, tree-like camellias, &c. Their diameter is usually equal to their depth. They are glazed or unglazed, it being immaterial to their utility whether they are so or not; and are plain or ornamental and artistic according to taste and the purpose for which they are intended. In order to be healthy receptacles for the roots of plants they must be provided with perforated bottoms to admit of the free egress of water from the soil. Saucers are made for all ordinary sizes of flower-pots for use in rooms and other places where drip would be inconvenient or undesirable. The sizes generally in use are made in the neighbourhood of most towns in Britain where suitable clay is to be had; but Weston-super-Mare is the most celebrated place for the manufacture of extra-sized flower-pots.

**Flower Sermons** are annual discourses founded on some subject connected with flowers. They were first instituted by the rector of the church of St Catharine Cree, London, in 1853. Generally the churches are decked with flowers, which are afterwards sent to hospitals.

**Flowers**, in Chemistry, is a term originally given by the alchemists to the sublimes which arose, or appeared to grow, from certain bodies capable of undergoing volatilisation when subjected to heat; thus, *flowers of antimony*, *flowers of arsenic*, *flowers of benjamin* or *benzoin*, *flowers of sulphur*, *flowers of zinc*, &c. See **ANTIMONY**, &c.

**Flowers**, **ARTIFICIAL**. Imitations, more or less exact, of natural flowers and foliage are extensively made for the ornamentation of ladies' bonnets, caps, and dresses, for head-wreaths, table and house decorations, and generally for employment where cut flowers and ornamental plants would otherwise be adopted. They possess certain advantages over natural flowers, chiefly from their toughness and durability, but in their use there is an absence of the sentiment which attaches to real flowers. The artificial flower industry is one of very considerable dimensions, but it is subject to great fluctuations owing to the caprice of fashion. It is almost exclusively a French trade, and the value of the exports from that country alone to the United Kingdom amounted in 1883 to £427,000, from which amount the total steadily declined till in 1887 it was less than £200,000.

The materials of which the artificial flowers commonly in use are made are cambric, jaconet, and other fine calico, with sometimes crape, gauze, velvet, and various yarns and threads with wire. Small feathers and portions of feathers, either natural colours or dyed, are also used effectively; and for cheap flowers to be used in public decorations, &c., coloured tissue-paper is employed. The Chinese make excellent artificial flowers from their so-called rice-paper (*shola pith*), and in the Bahama Islands pretty sprays imitative of flowers are made from small shells.

The petals and sepals of the flowers, as well as the leaves of the plant, are stamped out by punches, or 'irons,' as they are technically termed. A large stock of these irons is necessary, as special forms and sizes are required for each flower. The next process in shaping is that of 'goffering,' or 'gaufloring,' by means of which the hollow form is given to petals, and the midrib and veins of leaves are imitated. For hollowing petals the goffering-iron is simply a polished iron ball mounted on an iron wire in a handle. It is slightly warmed, the petal is placed on a cushion, and the iron pressed against the petal. A variety of other forms of goffering-irons are used, such as prismatic rods, bent wires, &c. The venation of leaves is effected by dies made of iron or copper, which are nevertheless called goffering-irons.

The tinting of petals of the best flowers requires some amount of delicacy and skill. In nature, moreover, the tint of each petal of a flower is rarely uniform; and the best artificial flowers represent the natural variations with great accuracy. The petals of a rose, for example, are dyed by holding each separately by pincers, and then dipping it in a bath of carmine, and afterwards into pure water, to give delicacy of tint; but, as the colour is usually deepest in the centre, a little more dye is added there while the petal is still moist, and this diffuses itself outwards in diminishing intensity. The whiteness at the insertion of the petal is produced by touching that part with pure water after the rest is dyed.

Leaves are cut and stamped in like manner from green taffeta, cambric, calico, &c. The glossy upper surface is represented by coating the taffeta, &c., from which they are stamped, with gum-arabic; and the soft tone of the under side is obtained by means of starch coloured to the requisite shade, and brushed on when of the right consistency to dry with the proper effect. A velvety texture is given by dusting the powdered nap of cloth, which has been previously dyed of the required colour, over the gummed leaf, the gum having been allowed to partly dry till it has become 'tacky.' The superfluous portion of nap is then shaken off. Buds are made of taffeta, tinted, and stiffened, and stuffed with cotton. Stamens are made of short pieces of sewing silk stiffened with gelatin, and when dry the ends are moistened with gum and dipped in flour coloured yellow to represent the pollen. Fine wire is sometimes used for the filament of the stamen.

The flower is built up from the centre: the pistil and stamens are tied in a bunch to a piece of wire; the petals are arranged in order, and pasted; then the sepals of the calyx are pasted outside of these, and further secured by winding fine thread or silk round the lower parts. Other wires are enclosed with this thread, and form the stalk, which is bound round with green tissue-paper; and at proper intervals the leaves are inserted by means of fine wires to which they are bound, the ends of these wires being bound in and incorporated with the stalk, and concealed by the green paper.

Flowers suitable for mourning are prepared by coating leaves, flowers, &c. with strong gum, and then dusting upon them powdered galena, a natural sulphide of lead, which gives the surface over which it is spread a sombre, dark-gray, metallic lustre. Flower wreaths for memorials on tombs are now largely made of pottery ware, and to a smaller extent of enamelled or painted iron. Very delicate and graceful imitations of flowers for memorials and for decorations are also moulded in wax; but these industries do not come within the range of what is known as the artificial flower trades.

**Flowers**, **FLORISTS'**, are those numerous forms of flowering plants which, having an inherent tendency to vary in the colour and size of their flowers and in habit when reared from seed, have received special attention in cultivation and in selection with the view of bringing their floral qualities up to ideal standards of excellence formed by the common consent of florists for each particular variety. Thus, for instance, the pansy, one of the most familiar of florists' flowers, is in all its wonderful variety the progeny of *Viola tricolor*, a widely distributed native of Britain. Its natural tendency to seminal variation rendered it a very facile subject in the hands of the florist, as may be seen by comparing the puny, unequal, and shabby flowers of the natural forms of the species with the large, circular, substantial, and brilliantly coloured blooms of the florists' varieties. This has been

achieved by the intelligent application of the principle of selection, the object being the attainment of a given ideal respecting the size, form, substance, and colour of the flowers. The petals are the only parts affected in this case; they are enlarged in breadth and length, their substance or thickness is increased, and their outline is rendered more symmetrical, but the other organs of the flower are not changed. As with the pansy, so it has been with every other kind of plant bearing single flowers in the florists' category. It is different with those kinds whose flowers are double, such as the carnation, anemone, hollyhock, ranunculus, rose, &c. In these the essential organs of the flowers have been wholly or partially metamorphosed into petals. But the so-called double flowers of dahlias, chrysanthemums, and other forms of the natural order Composite are not really double in this sense; the fertilising organs are not changed to petals in their case; but the tubular florets of the disc assume the strap-like shape of those of the ray, and hence the semblance of double flowers in such cases.

The Dutch were the first among European nations to cultivate systematically florists' flowers: to them is due the merit of having brought the Tulip (q.v.), the hyacinth, the anemone, the ranunculus, and the rose to the high degree of perfection their numerous varieties now present. The French florists have also had a large share in the improvement of the three last-named classes. British florists have distinguished themselves more particularly in the production of auriculas, polyanthus, the phlox, pentstemon, carnation, pink, hollyhock, dahlia, pansy, pelargonium, &c. But the Chinese and Japanese appear to have fostered the culture of many flowers in the same way as the European florists, long prior to the latter having done so. Camellias, azaleas, and tree-peonies were some of their favourite florists' flowers long before Europeans had much intercourse with the Chinese.

New varieties are obtained chiefly from seeds, but some also are obtained by *sports*, which, in the language of the florist, mean freaks of nature. Thus, the flowers on a certain shoot of a plant may perhaps exhibit features of a kind novel and distinct from those of the parent, and the variety, if worthy of being perpetuated, is propagated by cuttings or by grafting, according to the mode best adapted to the kind. If the variation becomes *fixed* or permanent a new sort is thereby obtained without direct seminal intervention; but this does not always follow, although a keen florist will never allow such an opportunity to escape without an attempt to improve it. Varieties of special merit in any class of florists' flowers can only be perpetuated by cuttings, layering, grafting, or division, because they cannot be relied upon to reproduce themselves from seed.

**Flowers, LANGUAGE OF.** Around many flowers a consistent and well-understood symbolism has gathered, but the Orientals have developed this into a perfect vehicle for communicating sentimental and amatory expressions of all degrees of warmth. Still further complexity is added by the habit of employing flowers the Turkish or Arabic names of which rhyme with the other really significant words. 'There is no colour,' says Lady Mary Wortley Montagu, 'no flower, no weed, no fruit, herb, pebble, or feather, that has not a verse belonging to it; and you may quarrel, reproach, or send letters of passion, friendship, or civility, or even of news, without even inking your fingers.' Our own floral symbolism is much more direct, simple, and really poetical, being nearer what is revealed to the inward eye of a Chaucer and a Wordsworth than all the whimsical and ingenious fancies of the East. Leav-

ing aside all floral badges attached to particular families or clans; and all national heraldic associations, as of the rose with England, the thistle with Scotland, the shamrock with Ireland, the lily with the ancient crown of France; as well as all special historical signification arbitrarily attached to any flower, as the red and white roses of Lancaster and York, Napoleon's violet, or Lord Beaconsfield's primrose; we may say that everywhere the laurel is the symbol of glory: the olive, of peace: the rose, of love and beauty: the violet, of faithfulness: the daisy and white violet, of innocence: the rosemary, of remembrance: the amaranth, of immortality: the asphodel, of death and the unseen world: the weeping-willow, yew, and cypress, of mourning. So surely as the orange-blossom is proper to marriage does the fluting of white heather betoken good-fortune to come, while the future chances of love may be revealed from the marguerite and poppy by a simple method of divination. Again, the almond expresses hope: the lily of the valley, unconscious sweetness: the white Juliette and the wallflower, love faithful in spite of adversity: the anemone, sickness: the primrose, early youth: the cyclamen, diffidence: and the arum or wake-robin, ardour. The turnip is strangely said to symbolise charity, while more naturally the young Persian offers his affection by the gift of a tulip. Neither the baneful properties attached to some plants, as the hemlock, belladonna, and mandrake; nor the magical qualities of the rue, the rowan, the elder, the thorn, the mistletoe, vervain, or valerian, fall to be discussed here; nor yet the old doctrine of Signature (q.v.), according to which plants bore certain marks indicating for what diseases they were medicinally useful. See John Ingram's *Flora Symbolica: Language and Sentiment of Flowers* (1882). For Flower-lore, see PLANT-LORE.

**Fludd, ROBERT**, an English physician and mystic, born at Milgate in Kent in 1574. After studying at Oxford, he spent some years travelling on the Continent, where he became acquainted with the writings of Paracelsus. On his return to England he settled as a physician in London, where he died in 1637. Fludd (Lat. De Fletibus) was the author of a theosophic system, the distinguishing features of which were the conception of man, the microcosm, as an analogy, in a physico-spiritual sense, of the universe or macrocosm, and the belief that the laws of the physical universe were dominated by two fantastic principles called the 'northern or condensing power,' and the 'southern or rarefying power.' His views called forth adverse criticisms from Gassendi, Kepler, and others.

**Flue.** See CHIMNEY, WARMING.

**Flügel, JOHANN GOTTFRIED**, German lexicographer, born at Barby in 1788, travelled as a merchant to North America, and in 1824 was appointed *lector* of the English language at Leipzig, where in 1838 he became United States consul, and in 1848 agent in Germany for the Smithsonian Institution. He died June 24, 1855. With J. Sperschil he edited a German-English dictionary (3d ed. 1848), and he assisted in the preparation of a *Praktisches Wörterbuch der englischen und deutschen Sprache* (11th ed. 1883). He also published a series of commercial letters in German and English (9th eds. 1873 and 1874), and other kindred works.

**Fluid.** In a solid body the constituent particles never move far from a certain position of equilibrium. In a fluid the particles can move about with greater or less freedom from one part of the body to another. All liquids, vapours, and gases are therefore known as fluids. All fluids are perfectly elastic; but liquids are highly incompressible, while gases can easily be compressed. In every actual

fluid there is more or less frictional resistance to the molecular motions; but it is often advantageous to consider theoretically the properties of frictionless, or, as they are called, 'perfect' fluids.

There is no sharp distinction between the solid state and the liquid state. Much depends upon external circumstances, such as temperature or the intensity of gravity. Some substances splinter under the action of sudden intense stress, while they flow like viscous liquids when exposed to long-continued gentle stress.

**Fluke** (*Fasciola* (or *Distomum*) *hepatica*), the parasitic worm which causes the 'liver-rot' of sheep. It belongs to the class Trematodes (q.v.), and to a large genus of about three hundred species, if the two titles *Fasciola* and *Distomum* be regarded as identical. The adult fluke, which occurs in

*Fasciola hepatica*, from the ventral surface (after Sommer);

The alimentary and nervous systems only are shown on the left of the figure; the excretory system alone on the right side; a, right main division of the alimentary canal; c, lateral ganglion; d, lateral nerve; e, mouth; g, ventral sucker.

numbers in the bile duct of the sheep and other domestic animals, has a flat, oval, or leaf-like appearance, the broader end being anterior. It usually measures nearly an inch in length by half an inch across at its broadest part. The colour varies from reddish-brown or orange at the sides, to grayish-yellow, sometimes with dark spots, in the middle. There are two suckers, as the word *Distomum* suggests—one at the head end, perforated by the mouth; the other imperforate, on the ventral surface, also in the middle line, a little farther back. The internal structure is complex. There is a much branched blind alimentary canal penetrating the whole animal, which is without any distinct body-cavity; the nervous system consists of a ganglionated ring round the beginning of the gut, with nerves running fore and aft; there are no sense organs, though the larva has eye-spots to start with; the muscular system

is well developed; the excretory system consists of two very much branched vessels opening at a posterior pore; the reproductive system is hermaphrodite, and exhibits a complex division of labour.

**Life-history.**—The history of the fluke is happily an intricate one and full of hazards. The ova are probably fertilised by male elements from the same animal, a very unusual occurrence, all but exclusively restricted to certain parasitic flat-worms. The eggs are furnished with nutritive capital from a yolk gland, are surrounded by a shell, and begin to develop a little within the parent animal. After extrusion from the latter they may be found in the bile ducts in enormous numbers, each fluke being said to produce about half a million. Such prolific multiplication is a very frequent characteristic of parasitic animals, and is probably associated with the abundant and at the same time stimulating food. Its utility in securing the continuance of the species in face of the numerous risks of failure is obvious. From the bile duct of the sheep the segmented ovum enclosed in its shell passes to the exterior. The embryo develops for two or three weeks, and the successful result eventually becomes

free in water. It swims for some hours by means of a covering of cilia, but its sole chance of life appears to lie in meeting and attaching itself to a small water-snail (*Limnæa truncatulus*), into which it bores its way. Having established itself, the embryo fluke loses its cilia, and is metamorphosed into what is called a *sporocyst*. This may divide transversely into two; but usually certain cells within the sporocyst behave like parthenogenetic ova, and develop into a fresh generation or several generations known as *redia*. The redia burst out of the sporocyst, and migrate into the liver or some other part of the snail, killing their host if they are very numerous. Like the sporocyst, they give rise internally to more embryos, of which some may be simply redia over again, while others develop into tailed embryos or *cercariae*. These emerge from the redia, wriggle out of the snail, swim freely in the water, climb up grass stems or such like, swing their tails off, and encyst. If the encysted cercaria on the grass stem be eaten by a sheep it grows into the adult and sexual fluke. To recapitulate, the developing embryo becomes a free-swimming form; this bores into a snail and changes into a sporocyst; from certain cells of the latter asexual redia arise; these eventually give origin in a similar way to tailed cercariae, which, eaten by a sheep, grow into flukes. There are thus several asexual generations interrupting the ordinary sexual process, illustrating what is known as 'alternation of generations.' The asexual process usually takes place by special cells, but there may be likewise transverse division of the sporocyst. The above history has been independently worked out by Leuckart and Thomas.

**Practical Importance.**—The disease of liver-rot in sheep is widespread and disastrous, killing, it is said, not less than a million per annum in the United Kingdom. It is especially common after wet seasons, and in low, damp districts. The external symptoms are described as 'emaciation, tenderness in the loins, harshness and dryness of the wool, and a scaly condition of the skin.' The preventives suggested are drainage of pastures and dressings of lime or salt; destruction of eggs, infected manure, and badly fluked sheep; giving the sheep salt and a little dry food. The same fluke occurs in other ruminants, and rarely in man. A related form, *Distomum lanceolatum*, has a similar distribution, and not a few other species have been reported as rare human parasites. The genus *Bilharzia* (q.v.) is not far removed. Other parasites, as of fishes (q.v.), are likewise called flukes.—See also ANCHOR, FLOUNDER.

See PARASITISM, TREMATODE; also Leuckart, *Parasiten des Menschen* (1863; new ed. 1879 et seq., trans. by Hoyle; Thomas, *Quart. Jour. Micr. Sci.* XXIII. (1883); W. E. Hoyle, *A General Sketch of Trematoda* (Edin. 1888).

#### Fluorescein. See DYEING.

**Fluorescence** is the term applied to a peculiar blue appearance exhibited by certain substances exposed to sunlight, and especially observable in a dilute solution of sulphate of quinine. See PHOSPHORESCENCE.

**Fluorine** (sym. F, eq. 19) is an elementary substance allied to chlorine. Its principal natural source is the mineral fluor spar,  $\text{CaF}_2$ , although it is also found in minute quantities in the igneous rocks, natural waters, plants, the bones and teeth of animals, as also in milk, blood, &c. All attempts to isolate fluorine in vessels of glass, gold, platinum, &c. have failed owing to its powerful action on these substances and the readiness with which it forms compounds with them. Recently, however, a vessel of an alloy of platinum and iridium has been used, and the pure substance obtained (1888). It is a gas having properties similar to those of chlorine, but differing in energy of action. The compounds

of fluorine are not numerous, but are important. *Hydrofluoric acid*,  $\text{HF}$ , is generally prepared by heating gently in a lead still a mixture of one part of fluor spar,  $\text{CaF}_2$ , with two parts of sulphuric acid,  $\text{H}_2\text{SO}_4$ , when the vapours of hydrofluoric acid,  $\text{HF}$ , are evolved, whilst sulphate of lime,  $\text{CaSO}_4$ , is left in the still. The dense acid vapours are conducted through a lead pipe into a lead receiver or bottle surrounded by a freezing mixture of ice and common salt. The acid is generally mixed with water when desired to be kept for some time. When the most concentrated hydrofluoric acid is required, the still and receiving vessel must be made of platinum. The other metals are not suitable for such apparatus, as they are rapidly corroded by the acid. When prepared in its strongest form, hydrofluoric acid has the density of 1.060, and is a colourless, fuming liquid of great volatility, which boils at  $60^\circ$  ( $15.5^\circ$  C.). Not only does hydrofluoric acid corrode and dissolve the ordinary metals (excepting lead and platinum), but when placed on the skin it produces a severe burn owing to its caustic nature. The most important property which hydrofluoric acid possesses is its power of eating into and dissolving glass, which admits of its application in the etching of characters upon glass, as in thermometer tubes, and for eating away greater or less thicknesses of plates or sheets of coloured glass, so as to produce a variety of shades. See GLASS, and GLASS-PAINTING.

**Fluorotype**, a photographic process in which salts of fluorine acid were employed for the purpose of producing images in the camera; but, as the impression was not very strong, the plate had to be afterwards steeped in a weak solution of protosulphate of iron. The process was first suggested by Robert Hunt in 1844.

**Fluor Spar**, or **FLUORITE**, a mineral which has been often described as chemically *fluorite of lime*, a compound of fluorine (hydrofluoric) acid and lime, but which is in reality *calcium fluoride*,  $\text{CaF}_2$ , consisting of 48.72 calcium, and 51.28 fluorine; occasionally it also contains some calcium chloride, and now and again organic matter, which is sometimes so abundant that when the mineral is struck with a hammer it emits a fetid odour—hence the name *fetid-spar* (Ger. *stink-Auss*). Fluor spar occurs both crystallised and massive, the massive varieties exhibiting a crystalline structure; the crystals appear usually in groups, sometimes of the primary form, which is a cube, but often of secondary forms, of which there is great variety, as the octahedron, rhombic dodecahedron, &c. Fluor spar is sometimes colourless, but often green, blue, yellow, or red, more rarely gray, or even black, different shades of colour frequently appearing in the same specimen, and in the massive varieties beautifully intermixed. Its colours often rival those of the most beautiful gems; but it is of very inferior hardness, being scratched even by quartz. Its specific gravity is 3.15 to 3.20. It generally becomes phosphorescent when heated, although this is more remarkably the case with some varieties than with others; it is decomposed by heated sulphuric acid, with evolution of hydrofluoric acid as a pungent gas; and, this having the property of acting upon and corroding glass, fluor spar is used with sulphuric acid for etching on glass. Fluor spar is also used for ornamental purposes, being wrought into vases, &c., for which it was in high esteem among the ancients. But the greater abundance in which it is now obtained has diminished the value of ornaments made of it. It is very commonly associated with ores of tin, silver, lead, and copper, occurring chiefly in veins, but is also found by itself in drusy cavities in granite and in veins in crystalline schists, slate, limestone, and

sand-stone. It has been met with also in volcanic tuff in Italy and in cannel coal in the United States, where it is limited to two districts in Illinois and Indiana. It is found only in a few places in Scotland, and in insignificant quantity, but is nowhere more abundant than in England, particularly in Derbyshire and in Cornwall. In Cornwall it is used as a flux for reducing copper ore. In Derbyshire the blue massive variety is known to the miners as *Blue John*. The manufacture of ornaments of fluor spar is carried on to some extent in Derbyshire; and fluor spar is often called Derbyshire spar.

**Flushing** (Dutch *Wissingen*), a strong fortress and seaport of the Netherlands, in the province of Zealand, is situated on the south coast of the island of Walcheren, at the mouth of the Western Scheldt, which it commands. Formerly an important naval station, it was converted into a commercial harbour in 1865-73, and carries on an active trade with Java, England, and South America. A daily service of steamers connects Flushing with Queenborough (Kent) in England; the passage lasting eight hours. There is a royal dockyard here; and, since 1875, a large floating-dock. The inhabitants (12,565 in 1888) are occupied mainly in shipping pursuits. The town capitulated to the Earl of Chatham in 1809.

**Flushing**, a post-village of Long Island, on Flushing Bay, a branch of Long Island Sound, about 9 miles E. of New York city by rail. It has large nurseries and gardens, an academy, convent, seminary, and private asylum. Pop. 6683.

**Flustra**, or **SEA-MAT** (q.v.), one of the commonest genera of marine Polyzoa (q.v.).

**Flute** (Fr. *flûte*, Ger. *flöte*, Ital. *flauto*), one of the oldest of wind-instruments, which originally had several varieties: one, in more modern times called *flûte à bec*, now developed into the Flageolet (q.v.); another, which was sounded by means of a hole in the side like the modern flute; and a third, used by the ancient Egyptians, in which the sound was produced by blowing into the open end of the tube. A modification of this last instrument is used still by the peasantry along the Nile.

The modern cone-bore flute consists of a tapered tube, in which the sound is produced by blowing with compressed lips into a large orifice near the top or wider end, which is stopped with a cork. Six holes in the lower end, to be covered by the first three fingers of both hands, serve to make the scale, supplemented by keys numbering from one to fourteen. The flute is what is called an octave-scaled instrument—i.e. by covering all the holes and lifting the fingers one by one in regular order, beginning at the bottom, the notes from D below the stave to C $\sharp$  are made; then, by repeating this process and blowing a little sharper into the mouth aperture, the same notes, an octave higher, are produced. Another octave can be produced by cross-fingering, the total compass being about three octaves. Two additional keys at the bottom of the tube, worked by means of levers by the little finger of the right hand, give the notes C $\sharp$  and C $\natural$  below the stave.

The faults of this flute are that, as the holes must be placed where the fingers can reach them, they are not always in the exact places to be perfectly in tune, and the notes are not equal in quality. To meet these defects the flute has undergone more changes and improvements in modern times than any other musical instrument. The most important of these have been the cylinder bore and the system of fingering introduced by Theobald Böhm in 1832, and patented in England by Rudall and Rose in 1847. The modern cylinder flute, from the head downwards, is cylindrical, or all one width of

bore, while the head-piece has a slight parabolic taper, and when combined with the Böhm fingering it forms a nearly perfect instrument, with all the notes in tune and of practically equal quality of tone. The holes are placed where they make the correct notes, and to facilitate manipulation they are stopped by means of keys which can be worked conveniently by the fingers. The fingering of the scale on the Böhm flute is quite different from the ordinary flute; and many other modified systems, more or less founded on the old, have been devised, among which may be mentioned those of Siccama, Clinton, and Carte. It would occupy too much space to describe their methods in detail. The general appearance of the Böhm cylinder flute may be seen in the figure.

Flutes are usually made in cocco-wood, ebony, silver, and gold, and vary in price from a shilling or two to about £180 for one made in 18-carat gold. The Böhm flute is very often made in silver, which is easily sounded and gives a fine liquid tone; it costs about 30 guineas. The ordinary cocco or ebony Böhm flute costs from 18 to 30 guineas, according as it is mounted in German silver or silver. Except for military flutes, which are still made conical, the cylinder has almost completely superseded the cone bore.

The flute described above is what is known as the concert flute; but flutes are also made in a variety of smaller sizes for various purposes in E<sub>2</sub>, F, B<sub>2</sub>, and C; there are also D, E<sub>2</sub>, and F piccolos or octave flutes, which are much used in modern orchestral music. In construction, however, they are all much alike, and need not be further described. A bass flute, too, is sometimes used, the Böhm variety being simply a large flute, 32 inches long and 1 inch in diameter, and having a compass from the upper G of the bass stave upwards. Also, see FIFE.

The concert flute, from the sweetness of its tone and the comparative simplicity of its execution, is extremely popular as an amateur instrument, and a great variety of music is published arranged for flute and pianoforte; and, as it plays the same notes as the voice and piano, it can be made useful in all kinds of music. The flute is made great use of in classical music; Bach, Haydn, Handel, Mozart, Beethoven, Mendelssohn, and all the later writers giving it a leading part in their works; while Quantz, Kuhlman, and many others devoted themselves almost specially to writing for it. See T. Böhm's *Essay on the Construction of Flutes*, and C. Welsh's *History of the Böhm Flute* (Kudall, Carte, & Co.).—For the 'flute' stop, see ORGAN.

**Flute-mouths** (*Fistulariæ*), a family of marine fishes, nearly allied to sticklebacks, remarkable for the elongation of the front bones of the head into a pipe bearing the small mouth at its apex. They live near the shore, and are widely distributed in the warm parts of the Atlantic and Indo-Pacific. There are but few species—e.g. *Fistularia tuberculata*, and *Aulostoma chinense*. The Snipe-fish or Trumpet-fish (q.v., *Centriscus scotopæ*) belongs to an allied family (*Centriscidae*).

**Fluting**, the mouldings in the form of hollows or channels cut vertically on the surface of columns. The idea is supposed to have been originally derived from the bundles of reeds tied together which formed the early columns of the Egyptians. Flutes were adopted by the Greeks as ornaments to their

Doric, Ionic, and Corinthian columns, and were retained by the Romans in their architecture. The Tuscan is the only style without flutes. In Doric (fig. 1) there are twenty flutes on the circumference, and the curves meet with a sharp edge.

FIG. 1.

FIG. 2.

These curves are supposed, in Greek Doric, to be elliptical, and they are carried up across the necking to the base of the cap. In the other styles there are twenty-four flutes on the circumference (fig. 2). These are semicircular and separated by a small fillet, and, before reaching the necking and the base, are terminated with semicircular top and bottom.

Flutes are said to be calbled when they are filled in to about one-third of their height from the base with a convex bead. This is done to strengthen the column and protect the flutes. In countries where Roman remains are abundant, as in the south of France, fluting was sometimes adopted by the early medieval architects, as at Arles and Autun. In Italy also traces of this decoration are visible during the middle ages; but the flutes are not limited to the vertical form—in Romanesque Architecture (q.v.) they assumed many varieties of forms, such as curves, zigzags, &c., twisting round the shafts.

**Flux** (Lat. *fluvius*, from *fluo*, 'I flow'), a discharge generally from a mucous membrane. The term is applied more or less frequently to all preternatural fluid evacuations from the body, but especially to those from the bowels and from the uterine organs. Dysentery (q.v.) was long termed the bloody flux to distinguish it from simple diarrhoea. See also CATARRH, DISEASE, MEDICINE.

**Flux** is the term given to the substances employed in the arts to assist the reduction of a metallic ore and the fusion of the metal. *White flux* is an intimate mixture of ten parts of dry carbonate of soda and thirteen parts of dry carbonate of potash, and is mainly instrumental in removing siliceous impurities by combining with the silica to form a fusible glass; *black flux* is prepared by heating in close vessels ordinary cream of tartar (bitartrate of potash), when an intimate mixture of finely-divided charcoal and carbonate of potash is obtained. The latter flux, when mixed with finely-divided metallic ores, and the whole raised to a high temperature in a furnace, not only is useful in removing the silica by the action of the carbonate of potash as above described, but the charcoal withdraws the oxygen from the metallic oxide and causes the separation of the pure metal. Limestone is employed as the flux in the smelting of iron ores. Its action is similar to that of soda and potash, and it is used because it is so much cheaper. Fluor spar, borax, protoxide of lead, and other basic substances are also used for fluxing. See IRON, COPPER, &c.

**Fluxions**. The method of fluxions and fluents was the name given after Newton to that branch of mathematics which with a different notation is known after Leibnitz as the differential and integral calculus. Newton, representing quantities in the

manner of Euclid and others by lines, looked upon them not with Leibnitz as made up of very small parts, but as described by a continuous motion. 'From considering,' says Newton in the introduction to his *Tractatus de Quadratura Curvarum* (1704—the first formal exposition of fluxions published), 'that quantities increasing in equal times and generated by this increasing become greater or less according as the velocity with which they increase and are generated is greater or less, I was in quest of a method of determining quantities from the velocities of the motions or increments with which they are generated; and naming the velocities of the motions or increments *fluxions*, and the quantities generated *fluents*, I came little by little in the years 1665 and 1666 upon the method of fluxions.' Instead of referring the rate of change of a dependent variable  $y$  directly to the independent variable  $x$ , as in the differential calculus, the method of fluxions refers each to time ( $t$ ) considered as a uniformly flowing quantity. Thus, the fluxions of  $y$  and  $x$ , denoted by  $\dot{y}$  and  $\dot{x}$ , correspond to  $\frac{dy}{dt}$  and  $\frac{dx}{dt}$  respectively. The fluent of any quantity, say  $y$ , was denoted sometimes by  $\overline{y}$ , sometimes by  $y'$ . The notation adopted by Newton was on the whole clumsy, and has been abandoned for that of the differential calculus. In the method of fluxions the notions of prime and ultimate ratios take the place that limits hold in the differential calculus. The most logical and complete, as well as the most bulky, treatise that has ever appeared on fluxions is that by Colin Maclaurin (Edin. 2 vols. 4to, 1742; 2d ed. 2 vols. 8vo, 1801). For other information, see the article CALCULUS.

**Fly**, a popular name best restricted in its simplicity to the insects forming the order Diptera, but often so widely used with a prefix—e.g. butterfly, dragon-fly, may-fly—as to be virtually equivalent to insect. The flies properly so called have two delicate, unfolded wings with predominant longitudinal veins, hind wings modified into balancers (*halteres*) or rarely absent, and mouth parts in general adapted for sucking. The larva is usually a legless maggot, or has secondary 'false' legs. Gnats, mosquitoes, midges, crane-flies, gall-midges, brecze-flies, blow-flies, bot-flies, forest-flies, and house-flies are common Diptera noticed separately.

**Fly**, a river of New Guinea, rising in the north-west corner of the British portion of the island; after making a curve westwards into Dutch New Guinea it flows south-east, and pours its waters into the west side of the Gulf of Papua, forming at its mouth a wide delta. First ascended by MacFarlane and D'Albertis in 1875 to a distance of about 90 miles, it was explored in 1885 by Captain Everill for 200 miles, to a point at which it is joined by a large tributary coming from the north-east, more than 300 miles long. The banks of the Fly are densely wooded.

**Fly-catcher**, a name applicable to any of the numerous birds which make up the Passerine family Muscipidae. The family includes a large number (over 40 genera and 280 species) of usually small-sized and often brightly coloured forms, very abundant in the warmer parts of the Old World and Australia, scarcer in temperate and colder regions, and wholly absent from North and South America, where they are represented by the Tyrant-shrikes or Tyrannidae. The nature of the bill is a distinctive feature; it is strong, short, and somewhat swallow-like, laterally compressed towards the slightly hooked point, and with bristles on the broad and flat basal portion. The common British Fly-catcher (*Muscicapa grisola*) is a tiny

brownish-gray bird, which reaches our shores from Africa in early spring, and leaves again with its brood in autumn. The upper surface is mouse-coloured, the under side is whitish, with brownish-gray longitudinal spots. Its cry is a monotonous chirp; its habit, like that of its neighbours, is jerkily active. It remains quietly seated till an insect is observed, makes a successful dart, and

Spotted and Pied Fly-catchers (*Muscicapa grisola* and *M. atricapilla*).

returns to its perch. In nesting it is nowise shy; a beam in an outhouse, the side of a timber-stack, the branch of a tree trained on a building, and even a lamp-post are among the sites recorded. The parents have been seen to visit their nest with food for the young not less than 337 times in a single day, which indicates a marvellous quickness of movement and adroitness in food catching. The Pied Fly-catcher (*M. atricapilla* or *luteosus*), with different colour, is common in south Europe, and has been recorded in Britain. There are ten other species in Europe and Africa. Among the other fly-catchers outside the genus *Muscicapa* are the Fantails (*Rhipidura*), with spreading tails, in oriental and Australian regions; the beautiful long-tailed Paradise Fly-catcher—e.g. *Terpsiphone paradisi* of the East Indies; the important genus *Myiagra* of Australia and the Moluccas; the interesting Australian 'Grinder' (*Seisura inquieta*), which 'hovers' like a kestrel, descends rapidly to the ground upon insect prey, and emits a curious noise (comparable to that made by a grinder at work) just before alighting, or when poised a few feet from the earth.

**Flying**, or **FLIGHT**, is the locomotion of an animal in the air by means of *wings*, organs specially adapted to that purpose. By means of these organs the animal raises itself from the ground and sustains itself in the air, as well as moves forward in any direction it desires. Birds and bats are the only existing vertebrate animals possessing the power of true flight; the lateral membranes of flying squirrels, flying lemmings, flying phalangers, &c. sustaining those animals in the air after the manner of the paper dart familiar to schoolboys. This toy is a folded, pointed arrangement, having this section , which, when projected from the hand with some force, will travel through the air for several yards. Flying-fishes, which possess enormous pectoral fins, are also sustained in the air for short flights on the same principle—rising and falling over the waves by means of the upward air-currents induced by the curved surfaces presented by the waters below. Examination of a

bird's wing—so different from that of an insect—will at once show that the mechanism of its flight is also different. The wing exhibits various curves, from its inner part where it inclines downwards to its tip, which is horizontal and sometimes turned upwards. Dr Pettigrew has endeavoured to show that all natural wings are screws, and that when vibrating they twist in opposite directions during the up and down strokes. Professor Marey points out the fallacy of this theory, and urges that the alternating movement of the wing cannot fairly be compared to the action of a screw. For, although we may admit that the wing revolves on an axis, its rotation is only a fraction of a turn, and is followed by the reverse action. This reversal in a screw would destroy the effect of the previous movement, just as the reversal of the movement of a ship's propeller will cause it to go backward instead of forward. A bird's flight is dependent upon mechanical laws; but there has always been a difficulty found in explaining it by those laws on account of the great rapidity of movement exhibited by birds when flying. We are, also, in ignorance of the exact amount of supporting power offered by the air to swiftly moving bodies of particular form. But form, we know, must play an important part in this aspect of the matter, as we find in the extreme cases of the fall of a solid round bullet and that of the same amount of lead beaten out into the form of a sheet. Hence many theories have been put forward to explain the flight of a bird, including the absurd notion that the bones and quills are charged with a light gas, such as hydrogen. It is obvious that there are marked differences in the mode of flight of different birds; some, like the humming-birds, progressing through the air by short and rapid strokes of the wings; whilst others—including the larger birds—combine such movements alternately with a period of apparent rest, when, with outstretched wings, they seem to sail along without any movement of the pinions whatever. This question of the 'sailing' of birds has given rise to much discussion, some averring that they have seen birds rising and remaining in the air for long periods without any movement of the wings. It is certain, however, that such periods of rest cannot be possible without an initial impulse by means of wing action, or by means of the impetus which would result from an oblique downward movement. We must also remember that the alleged stillness of the bird may be only apparent, and that the wings may be subject to slight variations of position which will enable them to take advantage of helpful currents in the atmosphere. We may take it for granted that a bird cannot 'sail' in perfectly still air for any long period, for such a power would be contrary to the natural laws with respect to falling bodies.

It may be assumed that in all creatures possessing the power of true flight the same principles are involved, although the movements vary with differences of form and structure. These movements have been subjected to careful analysis; but it must be admitted that the earlier investigators formed their conclusions more upon conjecture than upon direct experiment. Professor Marey, the eminent French physiologist, seems to have been the first to cause these movements to make their own records, which he did by carefully constructed apparatus, the principle employed being the same as that adopted in the sphygmograph and other modern instruments, in which a point in

direct connection with the moving part is made to trace a line on a blackened (smoked) surface. The same investigator was also the first to apply (in 1882) the photographic method to this field of inquiry. By means of a camera of special construction, which he called a photographic gun—for it was aimed at a flying bird like a fowling-piece—he was able to secure twelve different images of the bird on one plate in a single second of time; whilst by means of a chronographic attachment the duration of each movement was ascertained. He noticed in this way in the case of a flying gull four typical movements of the wings, which were repeated three times in one second. By placing the photographs thus obtained in a phenakistiscope attached to an optical lantern he was able to combine the successive images upon a screen and reproduce the movements of flight. These pictures

Flight of Crested Heron, 10 images per second (after Marey).

were little more than outlines or silhouettes; but under the microscope sufficient details of the feathers could be detected to enable Professor Marey to draw from their appearance certain conclusions. He states that each feather has a proper and independent motion, and that whilst they are brought closely together during the downward motion of the wing, they are somewhat separated and placed on edge during the return movement, so as to offer to the air as little resistance as possible. But he was forced to admit that such experimental photographs must be greatly multiplied, and taken with birds of various kinds in different positions with regard to the camera, before the study of flight could be made thoroughly complete. In 1884 further advances in photographic methods, and more especially the perfection to which the manufacture of rapid dry plates attained, enabled Anschütz in Germany to obtain photographs of birds in flight of a far more perfect character. These were so complete from an artistic as well as a scientific standpoint that they exhibited plainly the details of every feather on the flying bird. This inquirer had a concealed camera above a pigeon-house, and later on had the opportunity of making constant photographs of a stork's nest from a similar point of vantage. The photographs taken showed the parent birds (1) in flight, (2) hovering above the nest, (3) departing from it, and (4) arriving at their home. They fully corroborated the observations previously made by Marey.

The common argument, that because man has obtained such complete mastery of the ocean he should also be able to navigate the air, is fallacious, and can only be advanced by those who fail to comprehend the vast difference which exists between the two media. Air is compressible to an extraordinary degree—is elastic, and will offer little resistance or recoil if struck. Water, on the other hand, is almost incompressible—is inelastic, and offers such recoil if struck that a swimmer in diving from a height will suffer serious injury from contact with its surface, unless he take proper

precantions. We must remember, moreover, that a ship on the water is supported thereon without any need of energy, except to provide means for its propulsion. A flying creature, on the other hand, must be endowed with power to counteract the effects of gravitation, as well as to propel it through the air. It has been well shown by Dr Pettigrew how nature varies the travelling apparatus of different animals according to the medium in which the creature is destined to move. And he gives as illustrative examples the bull with comparatively small feet adapted for land; the turtle, with far larger travelling extremities adapted for water; and the bat, with immense wings in proportion to its size, for flight in air.

It is natural that man should from the very earliest times have endeavoured to fly, and the history of many countries records the various attempts that have been made in this direction, which attempts have always ended in ignominious failure. The balloon is but a thing of yesterday compared with the numberless devices which have been suggested and contrived to enable men to imitate birds in their passage through the air; for the balloon can boast of little more than a hundred years of existence, while these attempts at flight have been going on for thousands of years. It must be admitted, however, that the problem is no nearer solution to-day than it was at its first inception. It is true that we understand the principles of flight better than our forefathers did, and that we have at command new materials and methods of construction which they knew not of. Yet with all these advantages we cannot master the art of flying, and the reason of our failure is not far to seek. If we were able to construct a perfect pair of wings, endowed with every property pertaining to the natural mechanism of flight, we should be no nearer our goal, for the simple reason that we should lack muscular power to move them. Birds are not only light in proportion to their size—the largest weighing little more than 23 lb.—but they possess enormous strength. The pectoral muscles of a swallow are said to exceed in weight all its other muscles combined; and it may be said generally that those muscles in a bird upon which the wing action depends are hundreds of times proportionately more powerful than the muscles which actuate the movements of a man's arm. We must observe, too, that most of the swiftly-flying birds are carnivorous, are able to assimilate their food in a concentrated state, and that the temperature of their bodies is higher than in the mammalia. In this respect they may be compared to a small engine working at high pressure, and developing an enormous amount of energy. We must come, therefore, to the inevitable conclusion that, although it may be possible for man to make an experimental flight from a height with artificial wings, as has been done in the past, he will never be capable of sustained action in the air by the same means. Whilst we cannot concede the possibility of a man flying by his own muscular exertions, we must admit that a flying-machine is theoretically possible, and we may now point out the many practical difficulties which stand in the way of its achievement, and which hitherto have baffled the labours of the enthusiasts who have devoted much time to the matter. It may at once be remarked that the balloon has in no way helped in the solution of the problem. It is a mere lifting-machine, which, like a cork in the water, has no movement of its own, but is the sport of every current in the medium by which it is supported. A true flying-machine is one which will rise from the ground by self-contained energy—such energy being applied to (1) screw-propellers or (2) wings. So long ago as 1796 Sir George Cayley designed a

toy on the propeller principle, which was actuated by means of the energy stored in a bent bow. Of more recent years flying toys have been made, working propellers or wings, by means of twisted strands of india-rubber. We may also mention that flying toys on the kite principle have been constructed with some success. But when we come to consider the construction of a machine on a large scale, we find that we are beset with many difficulties. The most serious of these is the want of a motor powerful enough for the purpose which shall not be held to earth by its own weight. After reviewing all those which are at present known—including those actuated by compressed air, gas, and electricity—we must award the palm to the steam-engine, as being by far the most convenient means which we have for affording a continuous supply of energy of definite amount in proportion to its weight. But this energy falls far short proportionably of the amount expended by a bird in flight; and we must conclude that, until a motor be found that will in this respect approximate to the living bird, a flying-machine will be an impossibility. But supposing that such a motor be discovered, there will still remain the difficulty of the perfect balancing of the machine. A child learning to walk will be safe enough on a flat floor, but will soon fall down if its first steps are taken over unequal ground. The air may be compared to a surface having such inequalities, for it is not homogeneous, but is subject to eddies and currents in both upward and downward directions. A bird soaring in the air will instinctively meet an unexpected eddy affecting one wing by an immediate compensating movement; but a mere machine made by the hands of man would not possess this instinct; and it is difficult to believe that any mechanism, however beautiful in design, can effectually take the place of that which is associated alone with the breath of life.

See Pettigrew's *Animal Locomotion* (1873; new ed. 1882); M. Marey's *Animal Mechanism* (International Science Series, 1874); Reports of the Aeronautical Society of Great Britain; also correspondence in *Knowledge*, *Nature*, *English Mechanic*, and other scientific periodicals.

**Flying Animals**, in the strict sense, include most insects, birds, and bats, and these only. In past times there were 'flying reptiles' (Pterodactylus, Rhamphorhynchus), in which the outer finger was enormously elongated, and supported a wing-like expansion of the skin. In several ways these extinct forms were prophetic of birds, and certainly must be said to have had wings; but to what degree they were able to progress like birds in the air we do not know. For the true fliers, and for their interesting contrasts—e.g. between the wing of an insect and that of higher forms, or between the 'arms' of bat and bird—the relevant articles must be consulted; the present is devoted to a quite different set of animals, which are popularly called 'flying animals,' though they do not beat the air with wings.

(1) Among fishes, two very distinct genera (*Exocoetis* and *Dactylopterus*) have the power of skimming for considerable distances above the surface of the water, their expanded pectoral fins forming a parachute (see **FLYING-FISH**). (2) Some species of lizards in the genus *Draco*—e.g. *D. volans*—take short swoops through the air, the skin being stretched on several much elongated ribs, so as to form a sort of half kite on either side (see **DRAGON**). In some *Geckos* (q.v.)—e.g. the Californian *Phyllodactylus tuberculatus*—there is not a little membranous fringing of body, tail, and limbs. The flying powers of Wallace's 'flying frog' (*Rhacophorus*) have not been certainly established. (3) It is, however, among mammals that

attempts at parachute flight are most frequent, and that not in one order but in three: Marsupials (Petaunus), Rodents (Pteromys and Sciuropterus), and Insectivores (Galeopithecus).

**FLYING PHALANGER**, or **Flying Opossum** (*Petaunus*), a genus of marsupials, natives of New Guinea and Australia, where they are called Flying Squirrels, Sugar-squirrels, &c. Nearly allied to the Phalangers, they are distinguished by a hairy membrane or fold of the skin extending along the flanks, and used as a parachute to enable them to leap to great distances. This membrane extends along both fore and hind legs almost to the toes, but does not appear behind the hind-legs, nor include the tail. They are capable of modifying their course in the air, although not of true flight; and their aerial evolutions are very graceful. They repose during the day, and become active in the evening, feeding on fruits, flowers, leaves, insects, &c. A New Guinea species is as large as a cat;

1, Flying Phalanger (*Petaurus laguenoides*);  
2, Flying Mouse (*Petaurus pygmaeus*).

one of the Australian species is scarcely larger than a mouse, and is called Flying Mouse. The genera *Bolidens* and *Acrobata* have also parachutes. See **PHALANGER**.

**FLYING SQUIRREL** (*Pteromys* and *Sciuropterus*), two genera of squirrels (*Sciuridae*), the members of which have a fold of skin extended from the flanks between the fore and hind legs, by means of which they are enabled to take extraordinary leaps, gliding for a great distance through the air. The tail may also aid to support them in the air, as well as to direct their motion, its hairs being often extended laterally in a sort of feathery expansion, as in some of the flying phalangers. The genus *Pteromys* is especially well represented in the Indian region; *Sciuropterus* predominates in the north. The commonest Old-World species, the *Polatouche* (*S. volans*), from north-eastern Europe and Siberia, is about the size of a rat, grayish-ash colour above, white below, the tail only half the length of the body. It lives solitarily in the forests where birches abound, is nocturnal in habit, vegetarian in diet. The most common North American species, the *Assapan* (*S. volucella*), abundant from the Gulf of Mexico to Upper Canada, is fully 5 inches long, with a tail of 5 inches additional, fur included. The general colour is brownish-gray, lighter beneath. In gliding from tree to tree it descends obliquely and with very rapid motion, perhaps for a distance of 20 yards, and always lands of course at a considerably lower level than that at which it started. The flying squirrels are all arboreal and nocturnal,

and feed not only on nuts and young shoots of trees, but also on small birds. Some forms are readily

Flying Squirrel (*Sciuropterus volucella*).

domesticated; the fur is sometimes substituted for that of other squirrels. See **SQUIRREL**.

**FLYING LEMUR**, or **Colugo** (*Galeopithecus*), an aberrant Insectivore, with a parachute provided with special muscles, and even more efficient than in the preceding mammals. The hairy fold of skin begins behind the throat, includes fore and hind limbs as far as the claws, and extends along the tail to the tip. The animal has been observed to swoop over a distance of 70 yards. The claws are used in climbing; the lower front teeth are remarkably comb-like; the general colour is said to resemble mottled bark; the brain is very small.

Flying Lemur (*Galeopithecus volans*).

The flying lemurs are about 20 inches in length, are natives of the Indian Archipelago, inhabit lofty trees in dense forests, and feed chiefly on leaves and fruits, though said at times to eat insects, eggs, and even small birds. They are nocturnal in their habits, and very inoffensive, scarcely attempting to bite even when seized. Their voice resembles the low cackling of a goose. The female bears a single young one at a birth, and has a pair of teats on each side near the amples. The Pelew islanders greatly esteem them as food, but they have a rank, unpleasant smell. The zoological position of *Galeopithecus* is difficult to determine; it has been referred to the lemurs, to the bats, and with most justice to the Insectivores, while Wallace regards it as 'a lateral offshoot of some low form, which has survived during

the process of development of the Insectivora, the Lemuroidea, and the Marsupials, from an ancestral type.' Two species (*G. rolans* and *G. philippinensis*) are usually distinguished. The flying foxes (Pteropidae) are true bats and true fliers. See BAT, BIRD, DRAGON, FLYING, FLYING-FISH, INSECT, PHALANGER, PTERODACTYL, SQUIRREL, WING.

**Flying Bridge.** See FERRY.

**Flying Buttress.** See BUTTRESS.

**Flying Column.** See ARMY.

**Flying Dutchman,** a Dutch captain, Van Straaten, who was condemned, as a penalty for his sins, to sweep the seas around the Cape of Storms (the Cape of Good Hope) unceasingly, without ever being able to reach a haven. Seamen who saw his black spectral ship on the horizon quickly changed their course, and hastened to flee from his fatal influence. The notion that gave foundation to this legend is widespread in German mythology. The dead crossed the water in boats, and northern heroes were sometimes buried on land within their ships, sometimes placed in a ship which was taken out to sea and allowed to drift with the waves; while the same story is localised in the German Ocean, where Heinrich von Falkenberg is condemned to beat about the ocean until the day of judgment, on board a ship without helm or steersman, playing at dice with the devil for his soul. In the form of the legend chiefly current in England, the impious seaman's name is Vanderdecken, while his ship, which continually scours the seas, is, in all respects but reality, the image of a real ship. The legend gave Wagner the subject for his well-known opera, *Der fliegende Holländer*.

**Flying-fish,** species of *Exocoetus* and *Dactylopterus*, bony fishes which, though not indeed true fliers like birds or bats, are able to progress for some distance in the air, quite above the surface of the water. The genus *Exocoetus* is included in the family Scombræidae not far from the Pikes; while the genus *Dactylopterus* is referred to the Cataphracti, nearly allied to the Gurnards.

(1) *Exocoetus* (Flying Herrings).—There are over forty known species of this genus, mostly in the warmer seas. Two have occasionally been seen near British shores, one of which (*E. volans*), ranges from Australia through the Indian Ocean,

Flying-fish (*Exocoetus volitans*).

while the other (*E. volitans*) is common in the Mediterranean. The long pectoral fins, which extend to the anals or even to the tail, form the most characteristic feature. The usual length of the body is about a foot. Their 'flight' has been much discussed, with the following general results. The fins are kept distended like a parachute, and are not moved like the corresponding ap-

pendages of birds or bats; deviation from a straight course, whether lateral or vertical, is due to air-currents, except when the animals in their progress dip their tail into the water and give a stroke; 'their flight is rapid, but gradually decreasing in velocity, greatly exceeding that of a ship going 10 miles an hour, for a distance of 500 feet; they 'fly' most in rough weather, and farthest when more or less against the wind; in a calm their course is parabolic like that of a projectile, and close to the water, but they are liable to be lifted by the air-pressure over high waves, or by the wind on to the decks of ships; they leave the water when frightened, but also apparently from the mere exuberance of their constitutional activity. They swim and often 'fly' in shoals, and are chased by coryphæes (so called 'dolphins') and other fishes, as well as by sea-birds. They are good for eating, and are often netted by the natives of the South Sea islands and elsewhere.

(2) *Dactylopterus* (Flying Gurnards).—Of this genus three species are known, abundant in the

Flying Gurnard (*Dactylopterus volitans*).

Mediterranean, the tropical Atlantic, and Indo-Pacific. The young have comparatively short pectoral fins, and cannot lift themselves, but the adults 'fly' after the above-described fashion. They are larger and heavier than the *Exocoeti*, often measuring a foot and a half in length.

See Gunther, *Introduction to the Study of Fishes* (Edin. 1859); K. Möbius, *Die Bewegungen der Fliegenden Fische durch die Luft* (Leip. 1878).

**Flying Squid** (*Onychoteuthis*), a genus of decapod Cuttle-fishes (q.v.), widely distributed, especially in the warmer seas. The body is long, cylindrical, and pointed posteriorly, with two triangular fins, by help of which the animal can jerk itself out of the water, sometimes so high as to fall as a 'sea arrow' upon a ship's deck. Like other cuttle-fish, they swim rapidly by forcibly ejecting water from their mantle or gill cavity. They are included among those Cephalopods which have the cornea of the eye open, so that the sea-water reaches the lens. Their internal shell or 'pen' is furnished with three diverging rays, and a hollow conical appendage. The species vary in length from 1 to 4 feet. Gregarious in their habits, they prey upon shoals of mackerel and other fishes, and are themselves devoured by dolphins and other cetaceans, as well as by sea-birds. One species (*O. sagittatus*) is used very abundantly for bait in the Newfoundland cod-fisheries.

**Fly Poison.** This term includes the various preparations which are sold for the purpose of killing flies. Formerly powders on papers containing arsenic, and sweetened so as to attract the flies, were in general use. Since it has been found that paper dipped into a sweetened solution of quassia is equally efficacious, the poisonous article has been partly superseded. Under this heading may be included various viscid substances which, when smeared on threads or on boards, attract flies by their sweetness, and retain them by their stickiness.

For this purpose treacle and birdlime are fairly effective.

**Fly-trap.** See DIONÆA.

**Fly-wheel,** a large wheel with a heavy rim fitted to steam-engines, or other machinery, in order to equalise the effect of the driving effort. Its action depends on the principle that matter in motion possesses kinetic energy—e.g. a body in having its velocity reduced is capable of doing work. The amount of work it can do depends directly on the mass of the body, and on the difference of the squares of its initial and final velocities, and is numerically equal to  $\frac{m(v_1^2 - v_2^2)}{2}$ . A heavy wheel

thus becomes a reservoir of work when set in motion.

There are two principal cases in which the fly-wheel is commonly applied: (1) where the driving effort is intermittent or irregular, while the resistance to be overcome is for the time practically constant; and (2) where the resistance or work to be done is intermittent or irregular. The crank in a foot-lathe is a good example of the first case; the driving effort of the foot is only applied to the treadle on the down stroke, and the crank must rise independently of the effort. A fly-wheel attached to the crank-shaft effects this, the motion it acquires while the foot is acting gives it energy, and in virtue of this it is able to bring the crank up again into the proper position for the foot to act on the treadle. In single-crank engines the fly-wheel carries the crank over the dead centres (see CRANK), and whenever used in engines its function is to keep the speed steady during each revolution of the crank—i.e. to prevent misadventure during each turn; this it does by storing up energy during parts of the revolution when the effort is greater than the mean resistance, and giving it up again during those parts of the revolution when the effort falls below the resistance. In the gas-engine, where the effort (explosion) is often only applied during part of every second or third revolution, it does very important work. Its action must be clearly separated from that of the governor, whose function is to determine the mean speed or number of turns the engine shall make per minute; this the fly-wheel cannot in any way do—it can only keep the speed steady during each turn.

The second case is illustrated by a punching-machine. The engine need not be of sufficient power to directly force the punch through the metal, but with the aid of a fly-wheel it easily does it. The machine is so arranged that the actual part of each revolution spent in punching is very small; all the rest of the revolution the fly-wheel is storing up energy, nearly all the effort going in this. Then at the proper moment the work stored up is added to the direct work of the engine, and the punch forced through, the speed of the fly-wheel being proportionately reduced.

The principle of the fly-wheel is sometimes applied in other forms than that of a wheel—e.g. in fly-presses for stamping or coining metals, in which two heavy balls are fixed at the ends of a long lever, which is made to swing round with considerable velocity. The accumulated energy is given up at the moment of impact of the die upon the metal, and a force of great intensity called into play to compress the latter. Fly-wheels are not required in locomotives or marine engines (see STEAM-ENGINE).

**Fochabers,** a village of Elginshire, on the Spey, 7 miles ESE. of Elgin. Milne's Free School (1846) is the chief edifice. A mile north is Gordon Castle, the old 'Bog of Gight,' and the seat, since 1449, of six earls and four marquises of Huntly, five dukes of Gordon (the fourth of whom almost

rebuilt it towards the close of the 18th century), and now of the Duke of Richmond and Gordon. Pop. 1189.

**Focus,** in Optics, is a point in which several rays meet and are collected after being reflected or refracted, while a *virtual* focus is a point from which rays tend after reflection or refraction. The principal focus is the focus of parallel rays after reflection or refraction. See LENS, MIRROR, OPTICS, PHOTOGRAPHY. For the focus of geometry, see ELLIPSE, HYPERBOLA, PARABOLA.—The *Focimeter* is an instrument for assisting in focusing an object in or before a photographic camera; it is usually a lens of small magnifying power.

**Fodder** (A.S. *fōdor*, cog. with Ger. *futter*), the food collected by man for the use of the domestic herbivorous quadrupeds. In English the term is commonly restricted to dried herbage, as hay and straw; but in other languages it is more comprehensive, and includes all the food of cattle, except what they gather for themselves in the field.

The principal part of the food of the domestic herbivora is furnished by grasses, most of which are eaten by them when fresh and green. Besides the supplies which they receive of the surplus of corn cultivated for human food, they are also, to a considerable extent, dependent on the *straw* or dried herbage of the corn-plants for their winter provender; and that of many other grasses, cultivated on this account alone, is converted into *hay* for their use. Hay, being cut and rapidly dried whilst the plant is still full of sap, contains more nutritious matter than the ripened straw of the cereals. The most important perennial fodder grasses of Britain are Timothy, Foxtail, Cocksfoot, Tall Fescue, Meadow Fescue, and Hard Fescue. Perennial ryegrass, under certain conditions, may be added to the number. They should be all represented in ordinary mixtures for seeding land, down to permanent grass. Italian ryegrass surpasses the perennial in its power of yielding a large crop under favourable circumstances in a rotation. In the United States the best grasses are Timothy, Red Top or Rhodo Island Bout, White Top, Orchard Grass, and June Grass or Kentucky Blue Grass.

Next to the grasses are ranked the Leguminosæ, affording food for cattle in their seeds—as beans, peas, lentils, lupines, &c.—and in their herbage, on account of which many of them are cultivated, as clover, lucerne, vetch, tares, sainfoin, &c. When consumed green, the produce of these crops is usually termed forage or green forage. Some of them enter also largely into the composition of hay, being cut and dried with the grasses along with which they have been sown. Some of the Cruciferae are cultivated to a considerable extent as forage-plants, cattle being fed on their green herbage, although they are not suitable for drying as fodder. Among these are kale and cabbage, rape, &c.

In some parts of the world cattle are not unfrequently fed on the leaves of trees, as in the Himalayas, where the leaves of different species of *Aralia*, *Grewia*, elm, and oak are chiefly employed for this purpose, and are collected, dried, and stacked for winter fodder. In seasons of drought in India cattle are kept alive on the green leaves and pods of *Acacia* and *Inga dulcis*. See CLOVER, GRASSES, PASTURE, &c.

**Fœtus**, the term applied in Medicine to the mammalian embryo, especially in its more advanced stages. In the human subject we usually speak of the embryo at and after the end of the fourth month as a fœtus.

The weight and length of the fœtus at full term—nine months—varies within considerable limits. Observations on a very large number of cases have

shown that this variety is related to several conditions—e.g. sex, race, number of previous pregnancies of the mother, &c. Male children are from 8 to 12 oz. heavier than female; children born in Britain are heavier by 3 or 4 oz. than those born in France, and first-born children are 4 to 6 oz. lighter than subsequent ones.

On an average the fœtus at birth weighs from 6½ to 9 lb. But a healthy child may weigh as little as 5 or 5½ lb., and cases are on record where the child has weighed 17½ and 18 lb. Children under 5 lb. weight at birth rarely live, and when they do are puny. The length of the fœtus is 17 to 21 inches, occasionally being as much as 24 inches.

There are certain points in which the fœtus at the full period differs anatomically from the child shortly after birth. The bony skeleton is very incomplete, cartilage occurring in the place of many bones. Indeed, complete ossification (viz. of the vertebrae) is not finished until about the twenty-fifth year, and the only bones completely ossified at birth are the minute ossicles of the ear. The difference between the fœtus and the child in this respect is, however, only one of degree.

During pregnancy a temporary organ, termed the placenta (popularly known as the after-birth, from its being thrown off shortly after the birth of the child), is developed on the inner wall of the uterus (see *b* in the figure). This organ is mainly composed of vessels, and there proceeds from it the structure known as the umbilical cord, *a*, in which lie the umbilical vein, which conveys arterial blood to the fœtus, and the two umbilical arteries, which return the blood to the placenta. This umbilical cord conveys these vessels to the umbilicus or navel. Before tracing the course of the blood through the fœtus, we must notice the chief anatomical peculiarities presented by the vascular or circulating system before birth.

(1) In the heart we find a communication between the two auricles by means of an opening termed the *foramen ovale*. (2) In the arterial system we have to notice first the *ductus arteriosus* (see *r* in the figure), which is a large communicating trunk between the pulmonary artery, *q*, and the descending aorta, *s*, *s*; and, secondly, the branches given off by the internal iliac arteries, which go under the name of hypogastric as long as they are within the body of the fœtus, and of umbilical when they enter into the structure of the cord, are continued from the fœtus to the placenta, to which they return the blood which has circulated in the fœtal system. (3) In the venous system there is a communication between the umbilical vein, *c*, and the inferior vena cava, *f*, called the *ductus venosus*, *e*.

Pure blood is brought from the placenta by the umbilical vein, which passes through the umbilicus, and enters the liver, where it divides into several branches, *d*, *d*, which are distributed to that viscus, the main trunk or *ductus venosus*, *e*, passing directly backwards, and entering the inferior vena cava, *f*. The pure blood here becomes mixed with the impure blood

The Fœtal Circulation.

which is returned from the lower extremities and abdominal viscera, and is carried into the right auricle, *h*, and from thence, guided by the Eustachian valve (which is situated between the anterior margin of the inferior vena

cava and the auriculo-ventricular orifice, and is of relatively large size in the fœtus), passes through the *foramen ovale*, into the left auricle, *i*. From the left auricle it passes into the left ventricle, *k*, and into the aorta, *l*, whence it is distributed by the carotid and subclavian arteries principally to the head and upper extremities, which thus receive comparatively pure blood. From the head and arms the impure blood is returned by the superior vena cava, *o*, to the right auricle; from the right auricle it is propelled, as in the adult, into the right ventricle, *p*; and from the right ventricle into the pulmonary artery. In the adult it would now pass through the lungs, and be oxygenised; but in the fœtus it passes through the *ductus arteriosus* into the commencement of the descending aorta, where it mixes with that portion of the pure blood which is not sent through the carotid and subclavian arteries. Some of this mixed blood is distributed by the external iliac arteries, *u*, *u*, to the lower extremities, while the remainder (probably the larger portion) is conveyed by the hypogastric or umbilical arteries, *t*, to the placenta.

From the above description we perceive: (1) That a considerable quantity of the pure blood from the placenta is at once distributed to the liver, which accounts for its large size at birth as compared with the other viscera. (2) That a double current meets in the right auricle, one stream, guided by the Eustachian valve, passing through the *foramen ovale* into the left auricle, the other through the auriculo-ventricular opening into the right ventricle. (3) That the comparatively pure blood sent to the head and arms, as contrasted with the impure blood sent to the lower extremities, causes the relatively greater development of the former organs, and prepares them for the functions they are called upon to perform; the development of the legs at birth being slight as compared with that of the head or arms.

Almost immediately after birth the *foramen ovale* becomes closed by a membranous layer, and the *ductus arteriosus* and *ductus venosus* degenerate into impervious fibrous cords. The lungs, previously to the act of inspiration, are dense and solid in structure, and of a deep-red colour, and lie far back in the chest. Their specific gravity is greater than water, in which they (or portions of them) consequently sink, whereas lungs (or portions of lungs) that have respired float in that fluid.

Although nine months is the normal period of fetal development *in utero*, it is possible for a fœtus to survive though born much within this period. When a child is born in a state of development sufficient to enable it to survive, it is said to be *viable*. A fœtus born at 4½ months may give evidence of life, such as movement of limbs, attempts at respiration, &c., but of course cannot survive, and hence is not viable. Several instances have been recorded in which the fœtus survived after birth at 6½ months. At seven months viability is established, and with reasonable care a very large proportion of children born at this time survive. Such children may become perfectly healthy and strong, both mentally and physically. It is said that Sir Isaac Newton was born at the seventh month. The French code fixes the longest limit of gestation at 300 days—a limit rarely reached, if ever.

This article would be imperfect without a notice of the question—What constitutes live-birth? This is a point on which the most distinguished obstetric authorities have differed: some holding that where there is muscular movement there is life; while others maintain that where respiration has not been proved to have taken place the child was still-born. Amongst the most celebrated lawsuits bearing on this point we may mention that of

Brook v. Kellock, tried in 1861, in which it was decided that a child may live for some time after birth and not breathe, the absence of signs of breathing being held to be no proof of its being born dead. It was given in evidence that there was pulsation of the funis after separation of the cord, and the beating of the heart was regarded as proof of live-birth. Hence we may regard it as established in English law that respiration is not required to establish live-birth. Nor do the laws of France or the United States require that the child shall have breathed. In Scotland the law requires not only that the child shall have breathed, but that it shall have cried; and in conformity with this law a child which lived, breathed, and died in convulsions at the end of half an hour was declared to have been born dead. See EMBRYOLOGY, and other articles cited there; GESTATION, PREGNANCY.

**Fog, or MIST.** Water vapour is always present in the atmosphere, and it condenses either as rain, mist, or fog when the state of saturation is reached. In some cases dust-particles condense moisture from non-saturated air, and this produces what is known as a *dry fog*. Condensation of moisture takes place on a drop more readily the larger it is (see CAPILLARITY), and experimental proof has recently been given by Aitken in support of the theory that no condensation can occur without the presence of a nucleus. Such a nucleus is furnished by the visible or invisible dust-particles in the atmosphere. The amount of vapour present and the number and size of the dust-particles in part determine whether fog, mist, or rain will be formed, under given conditions of temperature and pressure; but the gathering of moisture into drops sufficiently large to fall as rain seems not to depend merely on the number and size of the particles on which condensation occurs. When a stratum of warm, dusty air gets cooled, a fog may be produced. The great amount of smoke-particles and dust-particles present in the air of large towns furnishes the conditions, in certain states of weather, that give rise to the intense fogs often prevalent in large cities. A morning fog disappears as the temperature rises, because of evaporation of the moisture from the nuclei. A fog is often produced in the evening over the surface of water or moist ground, because the air is sufficiently cold for condensation of vapour to occur. The fogs on the coasts of Nova Scotia and other places are caused by currents of warm air moving over cold water; so also the fogs caused on the coasts of Oregon and California by west and north-west winds. On the outskirts of an anti-cyclone fogs of immense breadth sometimes stretch for hundreds of miles lengthwise. Aitken has pointed out that dust-particles are probably efficient in the production of fog or rain in another way besides acting as nuclei. He believes that dust is a good absorber, and therefore a good radiator, of heat; for he has shown that, on equally clear days, the sun's heat is strong if the number of particles per unit volume of the atmosphere is small, but is weak if the number is large. Hence, when the sun's rays are withdrawn, the air surrounding the particles is rapidly cooled, and its moisture condenses.

Clouds, whether of fog, mist, or rain, though apparently suspended in the air, are in reality falling with extreme slowness. The force which causes drops to fall is their own weight, which is proportional to the cube of their diameter. The force acting upwards is the resistance of the air, which is proportional to the diameter. Hence, if the diameter of a drop becomes  $\frac{1}{10}$  of its original value, the resistance is reduced to  $\frac{1}{10}$  only of its value, while the weight becomes  $\frac{1}{1000}$  of what it was before, and so the drop falls far more slowly.

One of the worst fogs on record, alike for its density and protractedness, occurred in London from the beginning of November 1879 to the following February. The deaths for the six weeks ending February 21st were 1730, 1900, 2200, 3376, 2495, and 2016, the deaths in the fourth week being thus nearly double those of the first. Of all diseases the deaths from asthma were most directly influenced in fatality by the fog. In the first three weeks of 1880, when London was largely cleared of fog, the deaths fell 30 per cent. below the average; but in the end of January, when the fog again became severe, the deaths rose to 43 per cent. above the average. Bronchitis, pneumonia, pleurisy, other lung diseases, and whooping-cough, though not showing so strict an obedience to the varying density and persistence of the fog, rose to a much greater fatality, the death-rate from bronchitis rising to 331 per cent. and whooping-cough to 231 per cent. respectively above the averages of these diseases. Fogs are worst in the low-lying districts which are on the lee-side of the city, with respect to the direction of the light drift of the wind at the time, and least felt in the higher districts on the windward-side, the amount of suffering and number of deaths being proportioned to the density and persistence of the fog.

**Foggia**, capital of the Italian province so named (formerly Capitanata), is situated in a district abounding in olives, vines, and other fruit-trees, 76 miles NW. of Bari by rail. It is a handsome, well-built town, with a cathedral, commenced in the Norman style in 1172, but partially destroyed by an earthquake in 1731, and afterwards rebuilt in a different style. It is the most important mart in Apulia, and a celebrated fair is held here annually in May. Pop. (1881) 38,852. Foggia, supposed to have been built from the ruins of the ancient *Arpi*, was a favorite residence of the Emperor Frederick II., and here died his wife, Isabella, daughter of the English king, John.

**Fog-signals**, audible warnings used on board ships, on the sea-coast, or on railways, during fogs and mists, or at any other time when lights or ordinary daylight-signals are not available.

The commonest fog-signal on shipboard is the ringing of the ordinary time-bell at frequent intervals, or striking the anchor with a hammer, together with the occasional discharge of musketry and heavy guns. These are adopted, to prevent collisions, when ships are overtaken by a fog in the British Channel, or other places where shipping is abundant. The blowing of a horn, the beating of a drum, an empty cask, or a gong, and various other unusual sounds are also adopted. Steamers and sailing-vessels at anchor sound bells at intervals not exceeding two minutes; sailing-vessels under weigh sound a fog-horn, and steamers sailing their whistle. These sounds, however, only indicate rudely the position of the ship, and not the direction in which she is sailing. Many plans have been devised for a code of signals, by which the directions north, south, &c. might be indicated by the varying length of each sound, or the intervals between the sounds of a fog-horn or whistle.

British ships of war, when under steam, sound a prolonged whistle, at intervals of not less than two minutes. When under sail, one blast with the fog-horn indicates that the vessel is on starboard tack; two blasts in succession, that she is on the port tack; these are to be repeated at intervals of not less than two minutes. When at anchor the bell is sounded instead of horn or whistle. It is very desirable that some general code of signals of this kind should be adopted for the merchant service as well as the navy, and that its recognition by the marine of all other nations should

be procured. The admiralty have such a code for the direction of a fleet of ships of war in thick weather, but its application is limited to the navy. See SIGNALS.

Fog-signals from the shore are very desirable, especially on a dangerous coast. Bells and guns have both been used for the purpose, but when a strong wind is blowing in towards the shore their sound is heard only at a very short distance out to sea. Consequently steam-whistles, and fog-horns sounded by compressed air, are being employed in their stead. Fog-sirens, producing a sound after the manner described in the article SIRENE, are now largely in use, and are audible at a distance of from two to ten miles.

The fog-signals used on railways are small cases charged with detonating powder, and laid upon the rails. They explode loudly when the wheel of an advancing train comes upon them. They are used not merely in fogs, but in all cases of danger from obstruction of the line, or in other cases of urgency when a train has to be stopped without delay. Station-masters and railway police are furnished with them.

**Föhr**, a fertile island in the North Sea, off the west coast of Sleswick, to which it belongs. Area, 28 sq. m.; pop. 4150, Frisians by race, and principally engaged in fishing and fowling. The chief town is Wyk (pop. 1063).

**Foil** (Lat. *folium*, 'a leaf') consists of metal reduced to very thin sheets, intermediate between the extremely thin leaf metal, such as gold and silver leaf, and sheet metal. There are two distinct classes of foil in common use—the foil which in tenacity approaches leaf metal, and the much stouter tinsel foil used by jewellers, and for theatrical ornaments, &c.

Tinfoil is made by rolling bars of tin down to fine sheets, which are further attenuated by being laid in piles and beaten with a wooden mallet. Formerly tinfoil was very largely used for the 'silvering' of mirrors, by amalgamation with mercury; but that process is now little employed (see MIRROR). The chief consumption of tinfoil is now in connection with the wrapping up of chocolate and other confectionery, and of tobacco and other products which must be kept from drying in the air. It is also largely used for lining small boxes and cases, and in the preparation of Leyden jars and other electrical apparatus.

The bright foil used by jewellers and for theatrical and other ornaments, under the name of 'tinsel,' is made of copper, tin, tinned copper, or silvered copper. The last is now chiefly used by jewellers. The metal is rolled in a flattening mill, and the requisite brilliancy of surface is produced by finishing between burnished rollers and polishing. The various colours are produced by coating the white metal with transparent colours mixed in isinglass size. A similar varnish without colour is laid over the white foil, to prevent tarnishing. The socket or setting in which a stone or paste is mounted is lined with the foil, which, by reflecting from the internal facets the light that passes through the stone, adds considerably to its brilliancy. The natural colours of real stones are sometimes lightened or modified by coloured foil, and factitious colours are thus given to the glass or 'paste,' as it is called, of which spurious precious stones are made.

**Foil.** See FENCING.

**Foix**, capital of the French department of Ariège, lies in a Pyrenean valley, 44 miles S. of Toulouse by rail. Of the ancient castle of the counts of Foix (1362) there remain only three towers, all dating anterior to the 15th century. The town has iron and steel works. Pop. 5360.

**Foix**, an old French family, which took the title of count from the district of Foix (now the department of Ariège), in the south of France. The first who bore the title was Roger, who died in 1064. Roger Raymond accompanied King Philip Augustus to Palestine and distinguished himself at the taking of Acre. Afterwards, on his becoming an adherent of the Albigenses, his estates were confiscated by Simon de Montfort. He was a patron of the Provençal poets, and died in 1223. The next succeeding counts held their lands of the king of France; they were principally engaged in waging a feud against the House of Armagnac, and in fighting for the French king in the English wars. Gaston III. (1331-91), called, on account of the beauty of his person, *Phœbus*, was noted for his knightly love of splendour and military prowess. For his assistance to the king against the English in 1345, he was made governor of Languedoc and Gascony. In 1356 he took part in a crusade against the heathen Letts of Prussia, and in 1358 rescued certain members of the royal family out of the hands of the Jacquerie insurgents. On being supplanted in the governorship of Languedoc by the Duc de Berri, Gaston maintained his position by force of arms, and defeated the duke at Revel. He left a work on hunting, *Miroir de Phœbus*, whose bombastic style became a byword (*faire du Phœbus*). After his death without children, in 1391, the estates and title went to a collateral branch of the family. Gaston IV. rendered good service to Charles VII. in his wars against England. In 1455 his father-in-law, John II., king of Navarre, named him his successor, and the French king invested him with the seigniorship of Carcassonne and the

mother was Marie d'Orléans, sister of Louis XII. of France, received from his uncle the title of Duc de Nemours in 1505. In the Italian wars Gaston displayed such brilliant genius and bravery as to earn the title of 'Thunderbolt of Italy.' He twice overthrew the Swiss, at Como and Milan (1511); chased the papal troops from Bologna; seized Brescia from the Venetians; and won the battle of Ravenna over the Spaniards, 11th April 1512, in which, however, he fell, at the early age of twenty-three. On his death the estates and title went to the king of Navarre. Finally Henry IV. of Navarre attached the county of Foix to the French crown.

**Fokshani**, a town of Roumania, near the border-line between Moldavia and Wallachia, is situated in the former province, on the Milkoff, a tributary of the Sereth, 123 miles by rail N.E. of Bucharest. There is a considerable river trade with Galatz, especially in grain. Near Fokshani the Turks were defeated by the allied Austrians and Russians on 1st August 1789. Pop. 25,290.

**Földvár**, or DUNA-FÖLDVÁR, a town of Hungary, and a steamboat station on the Danube, 48 miles S. of Pesth, with sturgeon-fishery, vineyards, and manufacture of matches. Pop. (1881) 12,720.

**Foley**, JOHN HENRY, R.A., sculptor, was born in Dublin, 24th May 1818, became a student of the Royal Academy in 1835, and first exhibited in 1839. His 'Ino and Bacchus' (1840) attracted much notice, and was followed by a succession of admirable classical and ideal works, including 'A Youth at a Stream,' 'Cræctacus,' and several excellent subjects from Shakespeare. The most noteworthy feature of his work, however, was his careful and artistic execution of his statues and busts, which included the Hampden and Selden figures in St Stephen's Hall, Westminster; Goldsmith, Burke, and O'Connell, in Dublin; and the equestrian statues of Lord Hardinge and Sir James

Ontrani, for India, which rank among the finest equestrian sculptures of modern times. The statue of the Prince Consort for the Albert Memorial is also Foley's work. He died August 27, 1874, and was buried in St Paul's Cathedral.

**Folgoré**, an Italian poet who flourished at the end of the 13th century, the dates of whose birth and death and the incidents of whose life are unknown. He wrote a number of sonnets, all of which have been translated into English by Dante Rossetti and Mr J. A. Symonds. Their poetic merit is far from contemptible, and they are particularly interesting from the vivid light which they throw on Italian society. Their prevailing tone is one of refined epicureanism, and their style is mainly remarkable for affluence of imagery. 'Every line,' says Mr Symonds, 'presents a picture, and each picture has the charm of a miniature fancifully drawn and brightly coloured on a missal margin.' See Rossetti's *Dante and his Circle* (1874), and Navone's *Le Rime di Folgore* (Bologna, 1880).

**Foliation**, a term restricted by Darwin, and subsequently by geologists, to the alternating and more or less parallel layers or folia of different mineralogical nature, of which the crystalline schists are composed. It differs from Cleavage (q.v.), which is applied to certain superinduced divisional planes that render a rock fissile; and from lamination, in which the planes of separation in a rock are the result of deposition in successive layers. The folia of a schistose rock may be composed of only one mineral, but most commonly they consist of two or more; they are conspicuously lenticular, thickening and thinning out, and reappearing after an interval on the same or a different plane. These alternately lenticular folia are usually more or less closely welded or felted into each other, so that they are not readily separable; and they frequently present the appearance of being puckered or crumpled. The crystalline texture and the foliated character of the schists distinguish them at once from any ordinary bedded 'fragmental rock.'

**Foligno**, a town of Central Italy, on the Topino, 25 miles S.E. of Perugia. The town has a modern appearance, and possesses a cathedral and several churches. Tanning, paper-making, the manufacture of sugar confectionery, and the cultivation of the vine and of silk are carried on. The town was destroyed by the people of Perugia in 1281, and in 1833 it suffered severely from an earthquake. In 1439 it became subject to the pope. Pop. 8753.

**Folkes**, MARTIN, English antiquary, born in London on 29th October 1690, died on 28th June 1754, is known by two books on English coins—*A Table of English Gold Coins* (1736), and *A Table of English Silver Coins* (1745). He was a member of the Royal Society (president in 1741), of the Society of Antiquaries (president in 1750), and of the Paris Academy of Sciences.

**Folkestone**, a municipal borough, seaport, and bathing-place of England, on the coast of Kent, 7 miles W.S.W. of Dover, stands on uneven ground at the foot of a range of hills and up their slopes, the oldest part lying in a narrow valley, crossed by a fine railway viaduct. The town has rapidly extended and improved since the opening of the South-Eastern Railway, and of a daily service of steam-packets to Boulogne. Pop. (1881) 18,816; (1891) 23,700. Folkestone unites with Hythe in returning one member to parliament. The harbour is much used by boats employed in the herring and mackerel fisheries. In the vicinity are the remains of Roman entrenchments. Here Harvey, the discoverer of the circulation of the blood, was born in 1578.

**Folkland**, the public land of the nation in old English times, what remained to the nation over

and above what was possessed by individuals, families, or townships. It was under the control of the king and witan, and, after England was consolidated into one kingdom, was very large. But it was always diminishing, portions being granted to individuals for services rendered, and to the church, &c.; the land so alienated from the public became Bocland (q.v.). Portions were also granted temporarily to individuals for fixed services, and became practically hereditary. Under the Normans the king became supreme in the disposition of the public lands, which became merged in the private property of the kings. The distinction has been recently restored, and what are now called Crownlands (q.v.) still represent the old Folkland of England. See Stubbs's *Constitutional History*, and the article LAND.

**Folklore**, a term first suggested by W. J. Thoms in 1846 (*Athenæum*, August 22, under his well-known signature 'Ambrose Merton') to designate what was then for the first time becoming a subject of wide popular interest, considered as a department of the study of antiquities or archaeology, and embracing everything that related to ancient observances and customs, to the notions, beliefs, traditions, superstitions, and prejudices of the common people. Folklore, as understood by Mr Thoms, had indeed been observed and noted by countless writers from the Father of History downwards; the *Gentleman's Magazine* in the 18th century, and, in the 19th, his own well-known journal *Notes and Queries* (instituted 1851) being invaluable repositories of such observed facts; but it was not till after the beginning of the 19th century that the value of folklore for the elucidation of the social history of mankind had become apparent to thinkers, and its systematic study been seriously begun. Nor had there been wanting special collections of detached facts, very varied in quality but all of precious value now, by curious antiquaries, as John Aubrey in his *Miscellanies* (1696), or by speculative original thinkers, as Sir Thomas Browne in his *Pseudodoxia Epidemica* (1646). The former discussed in a gossiping manner such matters as omens, dreams, corpse candles, and second-sight; and another work by the same credulous author, *Remains of Gentilisme and Judaisme* (ed. by James Britton, 1881), 'did not disdain to quote' a multitude of ancient customs which would otherwise have been forgotten, and which have proved to be a precious mine for later and more scientific students. The Rev. Henry Bourne published at Newcastle in 1725 his *Antiquitates Vulgares, or the Antiquities of the Common People*, valuable chiefly for its record of old popular customs connected with the feasts of the church; and at the same city John Brand published in 1777 the first edition of his famous *Observations on the Popular Antiquities of Great Britain*. This work, as subsequently enlarged by himself, partly from the stores of miscellaneous facts of folklore collected in Sinclair's *Statistical Account of Scotland* (1791-95), and thoroughly revised by Sir Henry Ellis in 1813, ill arranged as it is, remains the richest of such storehouses of folklore as formerly—of materials for folklore as now—understood. Of other books containing similar records more or less valuable of detached facts, it may be enough here to name Strutt's *Sports and Pastimes of the People of England* (1801); Hone's *Every Day Book* (1826-27), *Table Book* (1827-28), and *Year Book* (1829); and Chambers's *Book of Days* (1863).

Meantime the reawakening to natural poetry, and to the beauty of free emotional expression in literature, which lay at the foundation of what it is usual to call Romanticism, had already begun even in the 18th century, and the publication of Percy's *Reliques of Ancient English Poetry* (1765)

had given a powerful impulse to Scott and others in England, to Herder, and to Arnim and Brentano in Germany, who found lying to hand a rich wealth of traditional poetry, the poetic value of which they fortunately had the eyes to see. But the study of folk-songs really began with Scott's *Minstrelsy of the Scottish Border* (1802-3). It was perhaps an advantage rather than a disadvantage that the first worker in this new field was but the folklorist unawares and mere great poet and romancer of genius that he was; for our folk-poetry would never have enriched and permanently influenced all later English literature but for its own intrinsic and genuine poetic quality, any more than our detached folklore facts would ever have risen above the dignity of the whimsical pastime of an idle hour but for their inherent though unsuspected faculty for throwing light backwards upon the history of human civilisation. And it is fortunate for us that we have had before us a succession of antiquarian students with curiosity enough to note and preserve things strange for their own sakes—facts merely half-understood or entirely misunderstood, but yet to be co-ordinated and systematised by later ages after a really scientific spirit had been born. The spread of book-learning and the inevitable diffusion of rationalistic ideas, the levelling of the ancient social distinctions, and the creation of totally new industrial conditions transplanting the people from the customs and ancient habitations of their fathers have stopped short the current of popular belief which has flowed traditionally down in undisturbed but ever-widening stream from the mists of obscure antiquity, and turned its waters, rich with the fertilising faculty of imagination, to overflow new fields within the vast vistas of science. Popular traditions began to be valued duly just as they began to decline and disappear; but fortunately a plentiful crop had been gathered and put into writing beyond the risk of oblivion before the growing disfavour for everything supernatural but religion itself, and the impatience of anything beyond the range of the practical and the profitable, had stripped our people of everything they had received from their fathers.

Yet the task of the folklore-collector even in England is not at an end, though the conditions under which he has to work are materially altered; for countless ancient notions still survive, although in strangely altered form, and although our citizens fondly imagine in all the pride natural to a little learning that all old things have been put away, and that all things have become new. The most consciously rational mind is ever unconsciously swayed by impulses and habitues, the origins of which are so obscure as to be entirely unknown and even unsuspected, but which weigh irresistibly though imperceptibly upon it. Yet these are the real springs of thought and the ultimate motives of character and conduct, so powerful is the effect of hereditary impressions upon man, so weak compared with it is even the influence upon the individual of the immediate environment in which he breathes. At no stage in human history is there ever a violent disruption from the preceding; society, like time itself, innovateth greatly but quietly, and by degrees scarce to be perceived. And, just as the biologist reasons back step by step from ascertained and verifiable facts to the most obscure and mysterious phenomena of life, so the scientific student of folklore co-ordinates the results of observation and experience, and builds them into a unity in a system that transcends the sphere of archaeology and even anthropology itself, and forms an integral part of the living structure of human sociology. But, while the laborious student may be permitted

to indulge the dream that his studies will supply some of the stones with which this stupendous temple may yet be built, he must not forget that to his generation belongs only the task of accumulating these materials, and that the building itself must be left to the larger generalisations of future ages. Meantime such works as Mr E. B. Tylor's *Primitive Culture* (1871), from a wide comparison of the essential identities and analogies between European and savage customs and superstitions, and Mr G. L. Gomme's *Folklore Relics of Early Village Life* (1883), from a close observation of the affinities between our own village and home-stead customs with those of other lands, have shown us what large and significant constructive results may already be attained with the evidence we possess. It is the peculiar merit of Mr Tylor to have demonstrated the evidential value of such *survivals* of more or less savage earlier states of society as still exist among us to reflect light upon the past. 'Survival in culture, placing all along the course of advancing civilisation way-marks full of meaning to those who can decipher their signs, even now sets up in our midst primeval monuments of barbaric thought and life. Its investigation tells strongly in favour of the view that the European may find among the Greenlanders or Maoris many a trait for reconstructing the picture of his own primitive ancestors.'

Just as the science of archaeology has been laboriously built up out of the relics of old races that have been brought to light, so the task of the folklorist is to construct the philosophy of primitive man from its still-surviving relics. These linger longest among the least progressive peoples, and it is in their superstitions and stories, whether in their native irrationality or as rationalised by a shallow philosophy, that the student will find the richest and most plentiful materials. He must not confine his pursuit of analogies to the experiences of merely Aryan or yet Old-World races, for in the survivals to be seen in the religious rituals and ceremonial traditions of the most civilised peoples he will find things absolutely identical with the beliefs and customs of present-day savages in Africa or the South Sea Islands. He will find in the most advanced a basis of absolute irrationality, or things believed in just because they are irrational—a process that gives a singular strength even to minds within the range of the highest religions; and this he will find it impossible to explain satisfactorily by other principles than those he applies to parallel and analogous irrationalities in Samoa or Zululand—there, however, neither irrational nor anomalous, but perfectly explicable in harmony with the universally accepted philosophy of life. Indeed, the wider the study applied to the social history of man, the more absolute becomes the certainty of the substantial uniformity in the working of the human mind under the same physical conditions everywhere. The civilised man preserves the fact, or the shadow of the fact, from the conservatism natural to man; the savage is more philosophical in his unconscious irrationality, and preserves the reasons for it also. Neither identity of race, nor community of origin, nor conscious borrowing need be postulated here; this theory is firmly based upon the elemental law of human nature—that the minds of men at parallel levels of culture are everywhere substantially the same, and develop naturally along the same lines in that gradual progress upwards, which is ever in movement, though ever differing in degree. The fundamental bases of popular beliefs then are everywhere the same: what is due to the particular race is the particular development of the belief. Gods, who are mere magnified men, capable like them of being

influenced by magical powers, and not more superior than men themselves to transformation into human and bestial forms; spiritual existences which pervade all nature, animate and inanimate alike, adding the human attribute of personality to all visible objects; ghost-souls surviving in shadowy form beyond the grave—these are the fundamental assumptions of all mythologies, and the essential foundations of the religion of all men. What race adds is the particular poetical form and colour with which the human imagination clothes its shadows. It is the peculiar merit of Mr Andrew Lang's contribution to the science to have elucidated this explanation with such felicitous wealth of illustration as to have made it the accepted working hypothesis of most modern mythologists, who are often grouped together as forming the anthropological school. It may be said that to him more than to any other scholar is due the widespread belief in the substantial identity between the most irrational and rudimentary mythologies and those of the Greeks, Scandinavians, and Hindus, however disguised or adorned these may be in the poetical accretions of successive generations of culture. His brilliant polemic has brought over most of the waverers into his camp.

Here, before going further, the reader has a right to demand that the relations between folklore and mythology should be set forth. The former will shortly be defined at more length; here it may be enough to say that mythology is properly the special science which treats of myths or legends of cosmogony, of gods and heroes. 'A myth embodies in human form primitive man's conception of a non-human action.' It, again, is sharply differentiated from religion, which, at its lowest, involves the conception of visible or invisible supernatural powers ascending into the range of the divine, whether beneficent or maleficent to man, and early concerned in establishing moral relations with humanity, the maintenance of which it regulates by a postulated system of rewards and punishments, distributed here or hereafter. With its beginnings, whether due to an original divine tradition, or to the innate *sensus numinis*—a necessity of man's complex nature—or to man projecting subjectively his own shadow upon the mists of the unknown, and receiving it again unconsciously as an objective efficient cause, neither mythology nor folklore has to deal. Nor may the last two be confounded as synonymous. 'At the most it can be urged,' says Mr Alfred Nutt (*Folklore Journal*, vol. ii. 1884, p. 313), 'that folk-belief and comparative mythology touch each other at a great many points, a fact which by no means necessitates the confounding together of the two studies. The relation between them may be stated thus: All, or nearly all, the facts of comparative mythology are to be found in folk-belief *in solution*; a great many facts of folk-belief are to be found in comparative mythology *crystallised*. The facts are essentially the same in both cases, but the one study deals with them at one, the other at another stage. It is when they have become at once rigid and systematised by passing through the hands of an hierarchical class, yet capable of development by falling under the artistic influence of the craftsman and the philosophic influence of the thinker, that comparative mythology has to do with them; before then they are but a portion of folk-belief. The two studies thus go hand in hand, and cannot be carried on at all without perpetual reference from one to the other.'

Before the rise of the anthropological school the prevailing method of explaining mythology was based upon the results gained by comparative philology. But long before this attempts of

various kinds at its explanation had been made, as allegorisations of physical or ethical truths, and even of biblical narratives; or as rationalisations of historical facts, culminating in the elaborate theory of Euhemerus—to be strangely and ingeniously revived under a new form in our own day by Herbert Spencer. The philological method is now usually associated with the venerated name of Professor Max Müller, but is substantially the same as that taught by the great fathers of modern folklore and almost of modern philology alike, Jacob and Wilhelm Grimm, and carried further by Adalbert Kuhn, Bréal, and many other scholars. The modern science of language early in the present century established the unity and homogeneity of the Aryan speeches, and from this Grimm, Kuhn, Max Müller, De Gubernatis, Dasent, and Cox, finding a vast similarity in the mythologies and popular beliefs of the peoples within this range, passed on to an assertion of an equal unity and homogeneity in their traditional lore. Myths were explained as due to a disease of language—to an assumed excessive figurativeness of phraseology practised by the common ancestors of the Aryan family, the proper meaning of which was lost by later generations, who yet went on using the phrases after the real meaning had been forgotten. Still more, the old terminations expressive of gender became confounded with significations of sex and personality. From what has been said before it will be understood that this explanation is not maintained in the present article, but its further discussion falls to the article MYTHOLOGY.

The modern folklorist, while gratefully accepting the results of the philological school so far as these go, insists on carrying his inquiries infinitely further than they did, and claims that savages and savage customs should be interpreted by themselves, and not by the traditions of peoples with whom they have neither linguistic nor ethnological affinities. The first two generations of folklorists have made a vast contribution to the science from the evidence offered within the Indo-European family; the third has extended its borders to embrace the native Australians, the Zulus, Hottentots, Maoris, South Sea Islanders, Red Indians, and Eskimo; and already the library of folklore and folk-tales actually extends to thousands of volumes.

First in importance of these is still the earliest, the *Kinder- und Haus-Märchen* (1812-14) of the brothers Grimm. The stories in the first two volumes of this wonderful work were collected during thirteen years from the lips of people living in Hesse and Hannau, many from a cowherd's wife with a special gift of story-telling. The Grimms' method of editing may still be taken as his canon by the collector: 'Our first aim in collecting these stories has been exactness and truth. We have added nothing of our own, have embellished no incident or feature of the story, but have given its substance just as we ourselves received it. It will, of course, be understood that the mode of telling and carrying out of particular details is principally due to us, but we have striven to retain everything that we knew to be characteristic, that in this respect also we might leave the collection the many-sidedness of nature. For the rest, every one engaged on a work of this kind will know that this cannot be looked on as a careless or indifferent method of collection, but that, on the contrary, a care and skill which can only be gained by time are required to distinguish the version of the story which is simpler, purer, and yet more complete in itself, from the falsified one. Whenever we found that varying stories completed each other, and that no contradictory parts had to be cut out before they could be joined together, we have given them as one; but when they differed, we have given the

preference to that which was the better, and have kept the other for the notes.' Wilhelm Grimm, writing in 1850, says: 'How unique was our collection when it first appeared, and what a rich harvest has sprung up since! At that time people smiled indulgently when we asserted that thoughts and intuitions were preserved in these stories, the origin of which was to be sought for in the darkness of antiquity. Now this is hardly ever denied. Stories of this kind are sought for with full recognition of their scientific value, and with a dread of altering any part of their contents, whereas formerly they were only regarded as worthless amusements of fancy which might be manipulated at will.' Grimm's *Deutsche Mythologie* (1835) is still unequalled in the range of its erudition and in the systematic thoroughness with which the mythology and superstitions of the ancient Teutons are traced back to the dawn of direct evidence and downwards in decay and diminution to the popular tales, traditions, and phrases in which they still unconsciously survive. These two works of Grimm created a school, whose abundant labours later folklorists have entered into, while they have enlarged the horizon of the science, because the stamp of soundness and sufficiency so far as it goes is impressed on all the work of Grimm and his successors, of whom, in Germany, the most eminent were Kuhn, Mannhardt, J. W. Wolf, and W. Schwartz.

Elsewhere, Castrén and Lönnrot devoted themselves to Finnish mythology; Asbjörnsen and Moe collected the Norse popular tales; Schiefner and Jülg, those of the Mongolians and Tartars; Hytén-Cavallius and George Stephens, those of Sweden; Afanasief, those of Russia; Haltrich, of Transylvania; Kreuzwald, of Esthonia; Von Hahn and B. Schmidt, of Greece and Albania; Arnason, of Iceland; Rink, of the Eskimo; Bleek, of the Hotentots; Calloway, of the Zulus; J. F. Campbell, of the west Highlands of Scotland. The study of these tales involved the study of the customs imbedded in them, and ere long a plentiful crop of books appeared devoted to the preservation of popular proverbs, customs, rhymed riddles, and the like, among which a place of distinction is due to the *Fairy Legends and Traditions of the South of Ireland* (1825), by T. Crofton Croker; the *Popular Rhymes of Scotland* (1826) of Robert Chambers; *The Nursery Rhymes of England* (1842) and the *Popular Rhymes and Nursery Tales* (1849) of Halliwell; and that not merely for the early date of their issue, but for their own intrinsic merits also. The great development of oriental studies that has marked the 19th century has opened up to the West through literary channels those vast treasures of eastern story from which many believe, as will be seen, that all our own traditional folk-tales were originally drawn in ancient ages. Max Müller's essays revealed to Englishmen a new world of undreamt-of affinities, and the combined charm of their literary grace, wide learning, and rare powers of exposition converted every reader to a theory which, as has been seen, is only now being displaced by another with a sounder basis of real philosophy and fact. Since then the study of folklore has become fashionable, indeed almost an article of patriotism, and societies have been formed in most countries to further its study. Of these the most important is still the Folklore Society of England, established in 1878, with a sufficiently wide programme, 'having for its object the preservation and publication of popular traditions, legendary ballads, local proverbial sayings, superstitions and old customs (British and foreign), and all subjects relating to them.' It numbers within its ranks most of the working folklorists of England, and has through its official organ, the *Folklore*

*Record*, monthly until its fifth volume, thenceforward quarterly under the new title of the *Folklore Journal*, made numberless contributions of the first importance to the science; while it has also distributed special treatises to its members so valuable as Professor Compagetti's *Researches respecting the Book of Sindibad*, Calloway's *Zulu Nursery Tales and Religious System of the Amazulu*, and an enlarged re-issue of Henderson's *Notes on the Folklore of the Northern Counties of England and the Borders*. The last and Miss Charlotte S. Burne's *Shropshire Folklore* (1886) are still the best books we have devoted to a particular district of our country. The *South African Folklore Journal* (1879-80) died untimely in its second volume. There is stronger promise of life in the American Folklore Society, instituted at Cambridge, Mass., early in 1888: (1) For the collection of the fast-vanishing remains of folklore in America, viz.: (a) Relics of old English folklore (ballads, tales, superstitions, dialect, &c.); (b) lore of negroes in the southern states of the Union; (c) lore of the Indian tribes of North America (myths, tales, &c.); (d) lore of French Canada, Mexico, &c. (2) For the study of the general subject, and publication of the results of special studies in this department. Already its journal has amply justified its existence by a series of articles of striking originality and value. In 1878 was founded in France by H. Gaidoz and E. Rolland a folklore journal of the very highest class, the well-known monthly paper *Mélanges*, which was interrupted after a year, and not resumed till 1884. In the year 1885 was formed the Société des Traditions Populaires, whose organ, the *Revue des Traditions Populaires*, has appeared monthly since the beginning of 1886. Yet a third French monthly is *La Tradition*, commenced in 1887. Meantime many special books have been published in France upon departments of folklore, and especially noteworthy are two admirable series of books: (1) *Les Littératures Populaires de toutes les Nations: Traditions, légendes, contes, chansons, proverbes, devinettes, superstitions* (29 vols. up to 1889), embracing books devoted to Upper and Lower Brittany, to ancient Egypt, Gascony, Normandy, Picardy, the Basque country, Corsica, Alsace, North-west Canada, Mauritius, Asia Minor, and the Vosges district; (2) *Collection de Contes et Chansons Populaires* (14 vols. up to 1889), including the stories of the Greeks, Portuguese, Albanians, Kabyles, Slavs, Indians, Arabs, French, Senegambians, Corsicans, ancient Provençals, Berbers, and Egyptian Christians. So widely popular have folklore studies become in France that a special congress of its students was held at Paris during the great Exposition of 1889. Of the more eminent folklorists of France may merely be named Gaidoz, Sébillot, Luzel, Bladé, Vinson, Cosquin, Puymaigre, Carnoy, Leger, and Rolland. In Germany again, since the time of Grimm, the continuity of the study has been unbroken, some of the more illustrious in the chain of names being Benfey, Steintal, Müllenhoff, Roehlholz, Simrock, Zingerle, Felix Liebrecht, Reinhold Köhler, Bastian, Veckenstedt, &c. The last founded in 1889 the monthly *Zeitschrift für Volkskunde*. Benfey's *Orient und Occident* lived only from 1862 to 1866. *Volkskunde*, an organ for Dutch folklore, was founded in 1888; *Wizla*, for Polish, in the same year.

In Italy among the chief names are G. Pitù and S. Salomone-Marino, joint-directors of the well-known quarterly, *Archivio per lo studio delle Tradizioni Popolari* (commenced in 1885); the former the author of more than forty folklore books and papers, and the indefatigable editor of the *Curiosità Popolari Tradizionali* (6 vols. up to 1889), as well as the *Biblioteca delle Tradizioni Popolari Siciliane*

(13 vols. 1870-89), covering with splendid fullness every department of the folklore of Sicily. Two other journals are *Giambattista Basile* (estab. 1883) and *Udubria* (1888). Other scholars who have made solid contributions are F. Sabatini (editor of *Folklore*, a monthly started at Rome, May 1889), Comparetti, Imbriani, Visentini, Bernoni, Laura Gonzenbach, Finamore, Nigra, Prato, Graf, Miss Busk, and Professor Crane. The *Canti e Racconti del Popolo Italiano*, edited by Comparetti and D'Ancona, already fill eight volumes (1871-89).

In Spain we have the *Biblioteca de las Tradiciones Populares Españolas* (11 vols. 1884-86), under the intelligent directorship of Antonio Machado y Alvarez. Other publications are the already extinct *Boletín Folklorico Español* (1885), and *El Folklore Andalúz* (1883), the *Biblioteca Popular de la Asociacio d'Excursions Catalana* (3 vols. 1884-86), and the collections of folk-songs or studies on these of R. Marin, Domofilo, Mila y Fontanals, &c. For Portugal the guiding names are Coelho, Braga, Leite de Vasconcellos, and Pedrosa; for Belgium and Holland, Von Reinsberg-Düringsfeld, Gilleo, Pol de Mont, and Wilken; for Russia, Afanasief, Kludyakof, Rudehenko, Wesselefsky, Dragomanoff, Buslajev, and Ralston; for the Basques, Cerquand, Vinson, and Wentworth Webster; for the Gypsies, Miklosich, Constantinescu, Paspati, Kopernicki, Wlislacki, C. G. Leland, and F. H. Groom; for Hungary, Hermann (*Ethnologische Mittheilungen*, first vol. 1887-89); for Finland, Krohn; for Roumania, Gaster; for Egypt, ancient and modern, Maspero and Spitta Bey; for the Welsh, Wirt Sikes and Professor Rhys; for India and Persia, the ancient literary collections of stories known as the *Hitopadesa*, the *Panchatantra*, the *Kalilah wa Dimnah*, and the *Kathā Sarit Sāgara* of Somadeva (*Ocean of the Streams of Story*, Tawney, 1880), with the special books by Benfey, Rhys Davids, and W. A. Clouston, as well as, for modern and oral stories, the works of Miss Frere, Maive Stokes, Lal Behari Day, Captain Temple (*Legends of the Punjab*), and in collaboration with Miss Steel, in *Wide-awake Stories*, Natēsa Sāstri, and J. H. Knowles. Few general books devoted to a particular country are so satisfactory to the scientific folklorist as Mr Turner's on Samoa, Mr Im Thurn's on British Guiana, and Mr Romilly's on New Guinea. Again, general books which no scientific folklorist can go far without consulting are those of Waitz, Gerland, Bastian, McLennan, Bachofen, Morgan, Hearn, Sayce, and Maistre, and last, though far from least, Taylor, Lubbock, and Lang.

*The Folklore Society's Definition and New Programme.*—The vagueness and looseness in signification of the terminology of folklore had become so inconsistent with the enormous advance of knowledge in all its departments that a general desire arose for an exact definition of its scope and functions. With this view a discussion was opened in the pages of the *Folklore Journal*, to which important contributions were made by Miss Burne, and Messrs Gomme, Sydney Hartland, Machado y Alvarez, Nutt, Wake, and Whentley, and afterwards by Captain Temple and Mr J. S. Stuart-Glennie. Mr Gomme's definition may now be taken as the working definition of the subject, both as upon the whole the simplest and most convenient offered, and from the fact of its possessing a kind of official sanction as the basis on which the society's *Handbook of Folklore*, which its author has long been preparing, is to be constructed. A code of questions on its lines has been prepared, similar to that drawn up by Sébillot in 1880, for the purpose of drawing forth such facts as are most helpful to the progress of real science and the formation of sound generalisations. Mr Gomme's definition

is—the science which treats of the survivals of archaic beliefs and customs in modern ages. His divisions are: (1) *Traditional Narratives*: (a) Folk-tales, (b) Hero Tales, (c) Ballads and Songs, (d) Place Legends; (2) *Traditional Customs*: (a) Local Customs, (b) Festival Customs, (c) Ceremonial Customs, (d) Games; (3) *Superstitions and Beliefs*: (a) Witchcraft, (b) Astrology, (c) Superstitions Practices and Fancies; (4) *Folk-speech*: (a) Popular Sayings, (b) Popular Nomenclature, (c) Proverbs, (d) Jingle Rhymes, Riddles, &c.

*Folk-songs, Ballads, Counting-out Rhymes, &c.*—The reader has already seen the important part that belongs to popular folk-songs or Volkslieder in the scheme of folklore, and he will find this department already treated with some fullness in this encyclopedia under the head of BALLADS. These belong also to literature proper, from their intrinsic poetic content, and from the important influence they have exerted upon more cultured poetry. The patriot whose survey ends with his own shores and the mere man-of-letters alike claim them as falling within their province, in so far as they are national history and literature as well as tradition. Yet these may be correlated with the traditional folk-poetry of other races no less than folk-tales, and we have a splendid example of this in Professor Child's treatment of our *English and Scottish Popular Ballads* (5 parts, 1882-88)—the best edition of a body of popular poetry available to the student.

Much attention has been paid in recent years to children's rhymes and formulas of play, which have been found to be handed down from immemorial antiquity, and to reflect with strange persistency the life and even the religion of long past times. An admirable book devoted to this subject, *The Games and Songs of American Children* (New York, 1884), by Mr W. W. Newell, has demonstrated the identity of the games and rhymes of American children of to-day not only with those of Old England, but with those of Germany, France, Italy, and Sweden. Those doggerel rhymes of unmeaning jingling words for 'counting out' live with startling persistence, and some idea of their venerable antiquity may be gathered from the history of the so-called 'Anglo-Cymric score,' a corrupted form of the Welsh numerals up to twenty, still used in Cumberland for counting sheep, but used by children in many parts of Great Britain, and more strangely still, even in America, where it has often been supposed to be of Indian origin. Of these jingles as many as 800 specimens have been collected by a single editor (H. Carrington Bolton, 1888). Though they have been preserved and transmitted with such persistent conservatism, the genesis of these jingles and counting-out rhymes is so natural that it is quite superfluous to explain them as survivals of ancient superstitions practices of divination by lot.

*Folk-tales, their Content, Origin, and Diffusion.*—These, the *Volks-märchen* of the Germans, the *Contes populaires* of the French, are properly popular tales handed down by oral tradition from remote antiquity. Besides this continuous life they have at various times been lifted into literature, and again reacted in new forms upon purely traditional lore, thereby complicating enormously the problems to be solved. Thus, in the *Odyssey* and *Rig-veda* we find distinct traces of veiled and degraded folk-tales; while in the *Panchatantra*, *Hitopadesa*, *Kalilah wa Dimnah*, and Somadeva's *Kathā Sarit Sāgara*, the *Thousand and One Nights*, the *Gesta Romanorum*, the *Disciplina Clericalis*, the *Tredee piacevoli notti* (1550) of Straparola, Basile's *Pentameron* (1637), the old French fabliaux, and the *Decameron* of Boccaccio we find

many actual folk-tales, more or less disguised by artistic processes of elaboration and refinement. These stories, from whatever sources originally derived, exercised a profound influence upon both eastern and western literature. In 1697 Perrault published his famous *Histoires ou Contes du Temps Passé*, seven stories undoubtedly written down substantially in their traditional shape. They created a fashion, and in imitation of them literary fairy tales were steadily produced throughout the 18th century, as may be seen in the voluminous *Cabinet de Fées*. But the beginning of real science was, as has been seen, the *Kinder- und Haus-Märchen* of the brothers Grimm. Since their time thousands of stories have been printed from all quarters of the globe, including Hottentot, Zulu, Swahili, Maori, Annamite, Brazilian, Samoan, Basque, Finnish, Eskimo, and Red Indian examples, as well as others from every province of every country of Europe. It is impossible here to enumerate these more fully; it may be enough to say that the most really valuable collections are still those connected with the names of Asbjørnsen and Moe, Von Hahn, J. F. Campbell, Calloway, Afanasief, Ralston, Pitré, Crane, Krauss, Sébillot, Luzel, Temple, and Cosquin. Many editors would have given greater value to their collections had they possessed an adequate grasp of the real conditions of the problem, and not hampered themselves by the perpetual necessity of finding facts to bolster up some preconceived theory.

The Grimms early found a startling similarity in the substance of these stories, and it only remained for later workers to discover the same identities when the comparison was extended far beyond the range of Aryan affinities. It was found that certain incidents, plots, and characteristics occurred everywhere—as the ill-treatment of the youngest son or daughter, who is eventually successful, and is often the heir; the substitution of a false bride for the true; the abduction of a bride by a youthful hero, and the pursuit by her giant (or supernatural) father, who is outwitted by cunning; a supernatural husband or wife, who is for some cause obliged to abandon a human mate; forbidden chambers, and the disasters that follow from their being opened; descents into the world of gloom, and the danger of eating there; husband and wife forbidden to see each other or name each other's names; the souls of the dead entering animal forms; and the interchange of kindly offices, as if on equal terms, between men and beasts. Again, the incidents are usually unnatural and irrational, completely traversing ordinary human experiences: thus, magical transformations, cannibalism, incest, beasts and men intermarrying, women bringing forth beasts and *vice versa*, and inanimate things obeying incantations and speaking like men are perfectly familiar occurrences. An attempt was made by Von Hahn, in the introduction to his *Griechische und Albanesische Märchen* (1864), to construct a scheme for classifying folk-tales so as to facilitate comparison, and this idea was developed by Baring-Gould, Alfred Nutt, and other folklorists, until at length it was adopted by the Folklore Society (Fourth Report, June 1882). A series of schedules was prepared for systematic tabulation, the following points being especially observed: (1) The fixing of a generic title for each story, and the abolition of the variant titles of the same story which now obtain in different collections; (2) the determination of a common terminology for the study of stories and for each description of story; (3) the determination of a common terminology for each story-incident; (4) the compilation of an index of story-incidents; (5) the tabulation of all stories

in printed collections upon a common recognised plan. An admirable example of work on these lines is Captain Temple's *Analysis and Survey of Incidents in Wide-awake Stories* (1884). The Society has also originated a similar analysis of customs, which promises to be no less fruitful in scientific results.

The time is not yet ripe for any satisfactory answer to the sphinx-like riddle of the origin and manner of diffusion of folk-tales; here it must suffice to state briefly the chief attempts at an answer hitherto offered. The first theory, sanctioned by the august authority of the Grimms, and maintained by Max Müller, Von Hahn, Dasent, and, with more zeal than discretion, by Cox and De Guhernatis, is that popular tales form a part of the mythology of the Aryan peoples, and were carried by them westwards at the primeval dispersion. Some consider them the *debris* of the saga and the epic, others again as the original elements by a reconstruction and artistic elaboration of which the epics and sagas were formed. The next contribution of first importance was made by Benfey, in the masterly introduction to his translation of the *Panchatantra* (1859). His contention was that the popular tales were carried to Europe from India, within historical times, and diffused chiefly through literary channels, such as translations of Eastern story-books and the like. A few special sources were the fables connected with the names of Æsop or of Bidpai; the *Panchatantra*, especially the parent of tales; and *Syntipas*—in other versions called the *Book of the Seven Wise Masters*, more closely connected with novel literature. Among the more important media of communication may be named the wandering and trading Jews, the Moors in Spain, and the Crusaders in their intercourse with the Moslems in the East and with the orientalised Greeks of Byzantium. Dr Gaster (*Ichester Lectures*, 1887) makes the old Slavonian religious literature the parent of the medieval and imaginative apocryphal literature, the romances and epics, and the didactic fables; and argues that oral folklore arose out of this written literature, the traces of which may be found in saga and romance, in religious and epic poems, in riddles and tales, and even in popular beliefs, customs, and habits. The ultimate common origin of all these was the East, of which not only the religion but the profane literature reached the Slavonic peoples through the medium of Byzantium—the open gateway of the East. He postulates a previous literary period, and affirms that not the legends alone, as now known to us, but also the fairy-tales, and even amulets and spells were almost unknown in Europe before the 10th century. Mr Clouston and M. Cosquin follow Benfey with greater or less modifications; and Mr F. Hindes Groome has made the striking suggestion (*The National Review*, July 1888) that one main channel of communication may well have been that ubiquitous, wandering, and specially gifted oriental race, the Gypsies. M. Cosquin argues that if the Aryan race before its dispersion preserved the myths only in their earliest germinal form, after the separate branches had lost touch of one another it would have been impossible that the final form of the myths—the household tales as we have them now—would have so closely resembled each other as they do. While admitting that the same ideas and situations are afloat wherever men exist at the same stage of culture, he refuses to allow that independent parallel or identical combinations are possible without conscious borrowing. What makes a story, properly speaking, is not the ideas which enter into it, such as speaking beasts, transformations, objects of magic, and the like, but rather the combination of the same, which is usually a thing entirely arbitrary; and it is impossible to believe, according

to M. Cosquin, that identical successions and combinations of incidents can occur without transmission by some means or other. He urges that the combinations in European folk-tales are Indian, nay, Buddhistic; consequently they must have been transmitted within the historical period from India.

The answer to this theory is to point to the vast accumulation of equally startling identities discovered among races far removed geographically from contact with India. It contradicts that homogeneity of human inventiveness which is found paralleled in the similar development of the arts of life everywhere. We are not told why stories can only be produced in India, and how Indian stories could possibly have penetrated within the period to the Zulus and the Iroquois. No doubt there has been some such borrowing as M. Cosquin's theory demands; and, indeed, we know of diverse currents which have carried in all directions several written collections; but the negation on which the theory rests will not support the weight it has to bear. Besides, the flank of M. Cosquin's position has been turned by the discovery that popular tales resembling those of India and Europe are found on papyri of ancient Egypt, dating 1400 years before our era. Sir Richard Burton and others attribute the origin of all human culture to Egypt, but of course it might here be said that ideas and combinations of ideas may have been carried from Egypt to India, which there ripened into fruit, and were scores of generations afterwards carried back again to the west. Mr Stuart Glennie makes 'the Arkhian White Races,' represented by the ancient Egyptians and Akkadians of Chaldean, the originators of human civilisation. They possessed common traditions, as of a Paradise and a Deluge, and were succeeded about 3000 B.C. by the Semites and about 500 B.C. by the Aryans. The grosser myths found among the white races are not survivals of their own primitive culture, but rather of the superstitions of the lower races with whom the white races came into contact; while myths found among the lower races are merely rude misconstructions of the symbolism of the higher races that subdued them. This theory is ingenious and interesting, but unfortunately its large postulates rest on much too feeble a basis of fact.

The most satisfactory theory hitherto offered—that of Mr Lang and the anthropological school—has already been stated substantially in the foregoing pages. It makes the spontaneous generation of similar ideas, incidents, and arrangements of these, under the same physical conditions, and at parallel levels in culture, the most important element in the manufacture of folk-tales. Popular tales are thus 'kaleidoscopic arrangements of comparatively few situations and incidents, which again are naturally devised by the early fancy.' At the same time it admits that the process of borrowing has also gone on, and that stories once invented may have been carried from people to people by daring merchants, captured alien wives, and slaves bought or carried off by violence. As a theory it confirms rather than contradicts the known facts of human psychology, and it traverses no hopeless difficulties of geography or history.

See the articles on ANIMISM, BALLADS, BEAST-FABLES, CHAT-BOOKS, DEMONOLOGY, DIVINATION, FABLES, FAULX, FAMILY, MYTHOLOGY, WITCHCRAFT, as well as on the names of the more important writers. Some of the more important books have been already mentioned; among general books may be named Bastian, *Der Mensch in der Geschichte* (1860); W. K. Kelly, *Curiosities of Indo-European Tradition and Folklore* (1863), antiquated, but still suggestive; Liebrecht, *Zur Volkskunde* (1879); Lang, *Custom and Myth* (1884), his preface to Mrs Hunt's trans. of Grimm (1884) and to his edition

of Perrault (1888); W. A. Clouston, *Popular Tales and Fictions* (1887); Gustav Meyer's *Essays und Studien* (1885); and Puymaigre, *Folklore* (1885).

**Folkmoor**, or **FOLKMOTE** ('folk-meeting'; A.S. *mot*, *gemót*, 'assembly'), was the old name in England for the public assembly of the nation for political and judicial purposes, or for collective deliberation. The old Germans had similar assemblies, as also the Scandinavians (the latter being called *Ting*, *Althing*). There were numerous local moots, such as the *shiremoot*, or County Court (q.v.). It cannot be said that there was in the old days a national folkmoor for all England, to which every freeman had a right to come; even the *Witenagemot* (q.v.) was not fully representative, but was rather a royal council of magnates.—The *Moot-hall* was the hall of meeting; the *moot-hill*, the eminence or mound on which the open-air assemblies used to be held. See VILLAGE-COMMUNITIES; and Gomme, *Primitive Folkmoors or Open-air Assemblies* (1880).

**Follicle**. See HAIR, SKIN.

**Fomentation** (Lat. *fomentatio*, *fomentum*; from *foveo*, 'I warm'), an application of warmth and moisture to a part, by means of cloths wrung out of hot water, sometimes medicated with vegetable infusions of substances calculated to relieve pain or stimulate the surface. Thus, opium, belladonna, camomile, turpentine, &c. are used in various forms in connection with fomentations, which are employed in almost all painful local disorders. A fomentation can generally best be made by laying a strong towel across an empty basin, placing upon it a piece of flannel, folded to the proper size, pouring over this sufficient boiling water to wet it, and wringing it out inside the towel. It can thus be applied at once hotter and less wet than if it is wrung out by the hands alone. A sheet of waterproof material should be placed over it, to prevent wetting of the clothes, &c.; and another flannel substituted as soon as the first becomes cool.

**Fonblanque**, ALBANY WILLIAM, English journalist, was born in London in 1793, and when only nineteen exchanged the law for journalism. As editor of the *Examiner*, a leading Liberal weekly journal, he exhibited a singular keenness both of wit and intellect, and exercised no inconsiderable influence on public opinion between the years 1830 and 1836. The characteristics of his political writings may be gathered from his *England under Seven Administrations* (1837), a reprint of articles published in the *Examiner* from the period of the Canning and Goderich ministries to the return of the Melbourne ministry. Fonblanque's services to the Whigs were rewarded by his appointment to the un congenial office of secretary to the Statistical Department of the Board of Trade in 1847. He died on 14th October 1872. A further collection of his writings from 1837 to 1860 was published by his nephew, together with a biographical memoir, in 1874.

**Fond du Lac** (Fr., 'end of the lake'), the capital of a county of the same name in Wisconsin, stands at the southern end of Lake Winnebago, 63 miles NNW. of Milwaukee by rail. It is connected by steamers with Lake Michigan, through Winnebago and the Fox River, and carries on a large trade in lumber, its principal manufactures being the sawmills. The city is supplied with water by nearly a thousand artesian wells. Pop. (1870) 12,764; (1880) 13,094; (1885) 12,726.

**Fondi**, a town of Italy, situated in the province of Caserta, NW. of Gaeta, and 6 miles from the sea, in a fertile but unhealthy plain, where grew the Crecuban wine of classic times. The town, through which passed the Appian Way, is still

partly surrounded by its ancient walls, and contains an old castle and a cathedral. Pop. 6773.

**Fonse'ca**, a bay on the Pacific coast of Central America, the proposed terminus of a projected interoceanic railway through Honduras.

**Fonseca**, ELEONORA PIMENTEL DE, MARCHIONESS, was born in Naples in 1758, and was lady-in-waiting to Queen Caroline until she forfeited her mistress's favour by remarking on her intimacy with Acton (q.v.). In 1798 she was an active partisan of the French; but on the fall of the Parthenopean republic in 1799 she was sent to the gallows at the instigation of the queen.

**Font** (*fons baptismalis*), the vessel used in churches as the repository of the baptismal water. In the early period, while immersion continued to be the ordinary rite in the administration of the sacrament of baptism, the Baptistry (q.v.) was furnished with a basin in the floor sufficiently capacious to admit of the immersion of a certain number of converts at one time. When infant baptism became general, fonts of an oblong form were employed, of suitable size for the immersion of a child. When it became customary to baptise by affusion—i.e. by pouring the water on the head of the person to be baptised—the size of the basin was naturally diminished, and eventually it assumed the dimensions and the form which are now familiar to us in most of the medieval churches in Great Britain and upon the Continent. The baptismal font, in its normal form, consists of a basin or cup, more or less capacious, but usually about 2 feet 6 inches in diameter, hollowed out of a solid block, and supported upon a stem or pedestal. It is ordinarily of stone, but some ancient examples of leaden fonts also occur, and a few of copper or of bronze. In general it may be said that the font, in its external design and character, followed the prevailing style of ecclesiastical architecture and ornamentation. There is some doubt as to whether any existing specimen in England really belongs to the Saxon period; but examples are found of all the later styles, from the Early Norman down to the latest revival of Gothic architecture in our own day; the Early English;

Font.

the Decorated, of which a beautiful example exists in the church of All Saints, Norwich; and the Perpendicular, which is seen in its highest perfection at East Dereham in the same county of Norfolk. The annexed illustration exhibits a highly characteristic specimen of the fonts of the beginning of the 14th century, which stands in the church of Swaton, Lincolnshire, erected about 1310.

The external figure of the basin was often octagonal, sometimes circular, sometimes square, more rarely hexagonal. Ancient sarcophagi were sometimes employed. The basin was commonly supported on a single pillar or stem. Many cases, however, occur in which it rests on three, four, or five pillars, or, as in the engraving, on a group of pillars or pilasters united into a solid stem. In the square font the central basin rested on a solid central stem, and four shafts supported the four corners. The angles of the frame were used for carrying the salt, the oil, and the candles employed (see V. le Duc, *Dictionnaire*, vol. v. p. 539, for illustration). The exterior, as well of the basin as of the pedestal, was often highly decorated, ordinarily with sculpture, but occasionally also in gold and colours; the designs on the basin commonly representing subjects connected with baptism, or its types and symbols. We frequently meet around the pedestal figures of the apostles, sometimes only eleven in number, Judas being omitted.

In the Catholic Church the 'chrism,' or consecrated oil blessed by the bishop, and also the so-called 'oil of catechumens' are mingled with the baptismal water, which is reserved for subsequent use. With a view to the preservation of the water thus reserved, the font, especially when it is of porous stone, is sometimes lined with lead; and from an early date it has been furnished with a lid, which is secured by a lock. The lid was originally a flat wooden cover, but in later times it is carried up like a spiral canopy, and is often of a highly ornamental character.

The ordinary place of the font is at the western end of the nave, near the entrance of the church; but in some cases, especially on the Continent, it stands in a separate chapel or baptistry, or at least in a compartment screened off for the purpose. Even when it stands in the open nave, it is properly enclosed by a rail.

The baptismal font is not to be confounded with the 'holy-water fount,' which usually stands near the entrance of Catholic churches, and from which persons entering sprinkle their forehead, in recognition of the inward purity with which we ought to enter the house of God; nor with the *piscina* or *cuvette*, which is found in the chancel or the sacristy of ancient churches, and which was intended to receive and carry away the water used in cleansing the sacred vessels and the other furniture used in the administration of the eucharist, though the font itself is also sometimes called *piscina*.

**Fontaine.** See LAFONTAINE.

**Fontainebleau**, a town in France, in the department of Seine-et-Marne, is beautifully situated in the midst of a forest, near the left bank of the Seine, 37 miles SE. of Paris, with which it is connected both by steamers on the Seine and by railway. It furnishes a great deal of wine and fruit for the capital, and has manufactures of porcelain, and a sandstone quarry. Pop. (1886) 13,216.

Fontainebleau is chiefly famous for its chateau, or pleasure-palace of the kings of France, and the forest that surrounds it. The forest covers an extent of 65 sq. miles, and presents much fine scenery. The chateau is said to have been originally founded by Robert the Good toward the end of the 10th century. It was rebuilt in 1169 by Louis VII., of whom and of Philip Augustus it was a favourite residence, and was enlarged by Louis XI. and his successors. After being allowed to fall into decay, it was repaired and embellished by Francis I., by Henry IV., and by Napoleon I. Almost every king has added something in the way of enlargement or embellishment, so that it bears the character

and style of almost every century. Louis-Philippe had all the paintings renovated, and the apartments restored in the taste of the 16th century. It was the residence of Christina of Sweden after her abdication, and here in 1657 she caused her secretary Monaldeschi to be executed. Under Louis XIV. it was occupied by Madame de Montespan, and under Louis XV. by Madame du Barry. Here Charles V. was entertained in 1539; here the decree for the revocation of the Edict of Nantes was signed in 1685; and here in the following year Condé died. In the château, too, Pope Pius VII. was detained a prisoner for nearly two years by Napoleon, and here this emperor signed the act of his abdication in 1814. In the forest Millet and other artists have lived and found their subjects.

**Fontaines**, MADAME DE, a French novelist, the date of whose birth is unknown. Her maiden name was Marie Louise Charlotte de Givri. She was a friend of Voltaire's in his youth, and died in 1730. She wrote *Amenophis* (a short story), and *La Comtesse de Savoie*, a tale of the 11th century.

**Fontana**, DOMENICO, an eminent engineer and architect, born in 1543 at Mili, on Lake Como. He became the papal architect in Rome, and was employed on many important public works, including the Lateran Palace and the Vatican Library. After the death of Sixtus V. he was royal architect and engineer in Naples, where he died in 1607.

**Fontanes**, LOUIS, MARQUIS DE, was born 6th March 1757, at Niort, in Poitou. After the completion of his studies he went in 1777 to Paris, where he acquired a reputation by his poems, *Le Cri de mon Cœur* (1778), *Le Verger* (1783), *L'Essai sur l'Astronomie* (1789), and *L'Épître sur l'Édit en Faveur des Non-Catholiques* (1789). He also wrote a metrical translation of Pope's *Essay on Man* (1783), with an elegant introduction, and an imitation of Gray's *Elegy*. During the Revolution Fontanes conducted a couple of journals in the popular interest, was appointed professor of Literature at the College of the Four Nations, and admitted a member of the Institute. In 1802 he was made a member, and in 1804 president, of the legislative body. His admiration of Napoleon was great, and his oratorical talents were often employed in eulogising the emperor's acts. In 1810 he entered the senate, and, passing on the fall of Napoleon into the service of the Bourbons, was raised to the peerage by Louis XVIII. He died at Paris, 17th March 1821. His writings, prose and poetic, which are regarded as models of elegance and correctness, were edited by Sainte-Beuve in 2 vols. in 1837, with a critical and biographical memoir.

**Fontarabia**, or FUENTERRABIA, a picturesque old frontier town of Spain, at the mouth of the river Bidassoa, opposite to the French town of Hendaye, below the west extremity of the Pyrenees. It was long an important fortress, and the frequent object of contention between French and Spaniards, especially in 1638, when Condé was defeated, and in 1794, when its fortifications were demolished by the French. Battles were fought near by between Wellington and Soult in 1813, and during the Carlist war in 1837. In 1888 a strong redoubt was completed on the heights above. Pop. 3713.

**Fontenay-le-Comte**, or FONTENAY-VEKDÉE, a town of France, in the department of Vendée, is situated at the head of navigation on the river Vendée, 27 miles NE. of La Rochelle. Its most remarkable buildings are the beautiful Romanesque church of Notre Dame, with a Gothic spire 311 feet high, and the fountain from which the town is said to have derived its name. The town has manufactures of hats, woollens and linen, tanneries, and a trade in grain, &c. Pop. (1886) 9282.

**Fontenelle**, BERNARD LE BOVIER DE, was born at Ronen, February 11, 1657. His mother was a sister of Corneille. He was educated by the Jesuits and studied for the bar, but entered early in life upon a purely literary career in Paris. In the great quarrel of Moderns *versus* Ancients, which was then raging in France, he took part with La Motte and the other champions of the Moderns, assailing the Greek writers and their French imitators, and receiving in return the satiric shafts of Boileau, Racine, J. B. Rousseau, and La Bruyère. La Bruyère ridiculed him pitilessly in the *Caractères*, where he figures as Cydias, the pedant who ranks himself above Plato and Theocritus, and confidently awaits the hour when men will recognise his superiority to Homer. After the failure on the stage of his *Aspar*—a play to which Racine ascribed the origin of the practice of hissing in theatres—Fontenelle produced an imitation of Lucian, entitled *Dialogues des Morts*, and the *Lettres du Chevalier d'Her...*, a work of fiction written in the 'precious' style afterwards adopted by Marivaux. Thenceforth he devoted himself mainly to literary criticism and to the task of popularising science. His prose works brought him a remarkable reputation, which was to some extent merited by the elegance of the style and the perspicuity of the exposition. In 1697 he was made secretary to the Académie des Sciences, of which he afterwards became president. His *Eloges des Académiciens* added greatly to his fame, and after the death of Boileau in 1711 he enjoyed a well-nigh absolute rule in the Academy. He died in his hundredth year at Paris, on January 9, 1757, and is thus a link between the age of Molière and Boileau and the age of Diderot and Voltaire. He was a man of remarkable vigour and versatility of intellect. The best writers of his day endeavoured in vain to crush him. Had he not possessed rare strength of character he must have succumbed to the attacks of the brilliant men whose enmity he incurred. He attempted well-nigh every form of literature, he wrote idyls, and satires, and dialogues, and critical essays, histories, and verses of society, tragedies (*Aspar* and *Idalie*), scientific treatises, and operas (*Endymion*, *Thétis et Pélée*, &c.). He has left no book of outstanding merit; he was not a strong original thinker, and he seems to have cared less for truth than for paradoxes and piquant phrases. But his learning was far from contemptible, his style was graceful, and his wit was keen. His best works, the *Entretiens sur la Pluralité des Mondes*, and the *Histoire des Oracles*, the latter based on the treatise of the Dutelman, Van Dalo, are still worth reading for the felicity of the expression and the frequent acuteness and ingenuity of the thought. Mr Lang has discovered the germ of his explanation of myths in Fontenelle's dissertation on Fables.

**Fontenoy**, a village (pop. 857) of Belgium, 5 miles SE. of Tournay, was the scene of a battle (11th May 1745) in the war of the Austrian Succession, between the French, 60,000 strong, under Marshal Saxe, and the allies (English, Dutch, and Austrians), in nearly equal force, under the Duke of Cumberland. After a hard-fought fight the allies were forced to retreat, the loss on each side being about 7000 men. The victory was in great measure due to the courage of the 'Irish Brigade' in the French army, as much being by Irish poets.

**Fontevrauld** (*Fons Ebrauldii*), a town in the French department of Maine-et-Loire, 8 miles SE. of Sammur, with a population (1886) of 2144. The place owes its origin to a celebrated abbey founded by Robert d'Arbrissel, a Breton monk, in 1099, as the residence of a monastic society composed of both nuns and monks. The society followed the

rule of Benedict, but was governed by an abbess, not by an abbot. The order of Fontevault, which received the papal sanction in 1106 and 1113, soon spread through France and into Spain, and acquired great riches. The abbesses belonged for the most part to illustrious families, and were subject only to the pope. At the outbreak of the French Revolution there were fifty-seven priories of the order in France, which, however, were then abolished. The 12th-century church contains sepulchral monuments to several English sovereigns and princes, including Henry II., his queen,

Eleanor of Guienne, Richard Cœur-de-Lion, and Isabella, the queen of John. Since 1804 the old monastic buildings and courtyards have been used as one of the central prisons of France, accommodating about 2000 convicts. See *Fontevault et ses Monuments*, by Edouard (2 vols. Marseilles, 1874).

### Fonthill Abbey.

See BECKFORD.

**Fontinalis**, a genus of Mosses, allied to Hypnum, but having the capsule in the bosom of the leaves, almost without stalk. Several species are British; one of which, the Greater Water-moss (*F. antipyretica*), growing upon rocks and roots of trees in brooks and ponds, is remarkable for the difficulty with which it burns, even when completely dried; on which account it is used in some parts of the north of Europe for lining chimneys to protect the adjacent woodwork from

Greater Water-Moss

(*Fontinalis antipyretica*):  
a, spore-case or capsule, divested of calyptra and lid, showing the peristome; b, spore-case, with its involucre of leaf-like scales.

fire. Its shoots are a foot or more in length, and branched; they float in the water. The fruit is on the sides of the stems.

**Foochow** (*Fü-Châu*), capital of the Chinese province of Fû-chien, with suburbs extending to the river Min, 25 miles above its mouth. The town proper is surrounded with walls nearly 30 feet high, and 10 feet wide at the top. The river is thronged with floating houses, and is crossed by a great bridge, 329 yards long, built of huge slabs of stone, some of them 42 feet in length, resting on forty piers. The Min provides an easy communication with the interior, with which a large trade is carried on in timber, paper, and cotton and woollen goods; and the port, opened to foreign commerce in 1842, is one of the principal tea-markets and mission stations in China. The trade has declined owing to the competition of Indian teas; but the export in the season of 1887-88 still amounted to 99,087,467 lb., of which 45 per cent. was shipped to London. The imports are chiefly opium, cotton goods, and lead. There are manufacturing of silk and cotton fabrics and paper, and some shipyards; and on an island some three miles down the stream there is a large government arsenal managed by Europeans. Pop. about 530,000.

**Food.** Although the word 'food' is generally taken to indicate those solid matters, such as bread, meat, &c., which are consumed by a person for the nourishment of his body, yet it is convenient to use

the term with a much wider significance. Under the term food we are forced to speak of all matters ingested for nutritive purposes, irrespective of their physical conditions, and to include beverages of various kinds, and even the air we breathe. There is the following very simple reason for this somewhat extended definition of the word. Water is the basis of all beverages, and no ordinary solid food is without some water, while on the other hand most beverages, wine, beer, tea, &c., contain solid matter dissolved in water. Air, as every one knows, is a vital and ever-pressing necessity, and its action within the body is eminently nutritive. The tissues of the body consume its oxygen as well as the nutritive parts of beef and mutton; and air we must therefore include within our extended definition.

The classification of food into solid food, beverages, and air would, however, be an unsatisfactory one. The chemist has been able to divide the food-stuffs, as we may call them, into classes, by sorting into groups substances which have similar chemical and physical properties. This arrangement has the advantage that members of the same class have nearly always similar properties as regards their nutritive functions.

### THE VARIOUS KINDS OF FOOD-STUFFS.

|                   |                           |
|-------------------|---------------------------|
| NITROGENOUS . . . | (Proteids.                |
|                   | (Nitrogenous extractives. |
| NON-NITROGENOUS   | (Carbohydrates.           |
|                   | Fats.                     |
|                   | Vegetable acids.          |
|                   | Inorganic salts.          |
|                   | Water.                    |
|                   | (Air (oxygen).            |

*The Nitrogenous Foods.*—These all contain nitrogen, and, inasmuch as during life nitrogen is invariably, and under all circumstances, excreted by the body, it must be replenished by nitrogenous food-stuffs. The proteids (albuminoid substances) are found both in the animal and vegetable world. Among animal proteids are the white of egg, the vitellin of the yolk, myosin from muscle (flesh of meat), fibrin and albumen from blood, and gelatin from bones. In the vegetable world vegetable albumens and globulins are present, and in the grains and seeds of plants they are found in quantity. Nitrogenous extractives are found in the muscles (flesh) of animals, and are probably of great value, chiefly as stimulants. Beef-tea is an extract of these from the muscle of the ox, and they are found in rich animal soups.

*The Carbohydrates.*—These are food-stuffs containing carbon, oxygen, and hydrogen, but no nitrogen. Moreover, the oxygen and hydrogen are present in the proportions which form water. The vegetable world furnishes us with the most important carbohydrates. These are the various starches and dextrines. Then we have the sugars—cane-sugar, grape-sugar, sugar of milk or lactose, &c. The flesh and other eatable parts of animals are poor in carbohydrates; nevertheless the latter are found there. Glycogen or animal starch is widely distributed, although, except in the liver, it is present in small quantity.

*Fats and Oils.*—These substances, of a very high nutritive value, are found in both the animal and vegetable world. In vegetables they are especially abundant in seeds and fruits. In the animal world we find them in the tissues under the skin, and in many animals, such as whales, seals, &c., the blubber, as it is called, is present in enormous amount. The liver is generally found to contain a great deal of fat, as is also the tissue round the kidneys, and round other abdominal organs. The chief fatty matters present are olein, stearin, and palmitin.

*Vegetable Acids.*—The action of these substances

as food-stuffs, though important, is not altogether understood; but their withdrawal from the food may lead to serious inconvenience. The most important vegetable acids are tartaric, oxalic, citric, acetic, and malic.

**Inorganic Salts.**—Of these the most important is common salt, or sodium chloride. It is present in small quantities in all foods, but in addition man requires as a rule a still larger quantity. It greatly assists digestion, and probably is necessary for the formation of the gastric juice. Whereas it can pass through the system if taken in large quantities, yet a certain amount is required by the body to establish within it those conditions under which alone life is possible. Thus, many of the proteids would suffer complete alteration were it possible to abstract all the salt from the body, and the blood would become at once a turbid fluid which would rapidly cease to flow. In addition to sodium chloride there are many other salts required, such as potassium chloride and the phosphates of calcium and magnesium, the latter for the formation of bone. Iron salts are required for the formation of the colouring matter of the blood.

**Water.**—This all-important substance is taken in its natural form as spring, river, well, or rain water. In all cases certain inorganic salts are held in solution, which vary in their nature and quantity with the soil with which the water has come in contact. Organic (both animal and vegetable) matter may be present, especially in river and shallow well water. In addition, water is present in almost every kind of solid food, as well as in liquid foods and beverages. Bread, meat, cheese, potatoes, all contain a large quantity of water, and such substances as flour and biscuits are rarely free from a trace of it. Its importance for the needs of the economy are at once apparent when we recollect the large amount daily excreted by the lungs, the kidneys, and the skin, all of which require replenishing.

**Air.**—From the atmosphere we breathe oxygen is obtained, without which the other classes of food-stuffs would avail us little. Their destination is, in fact, to meet with this oxygen, and suffer changes called 'oxidation changes' within the tissues of the body.

**SOURCES OF THE FOOD-STUFFS.**—*The Carcasses of Animals.*—From the carcasses of animals we obtain meat and bones and fat, all of which have an important nutritive value. Cartilage, gristle, and yellow elastic tissue (pax-wax) are of almost no utility. Meat consists of from 70 to 80 per cent. of water, and the rest of proteids, extractives, fats, salts, and indigestible substances. The proteids of meat form about 20 per cent. of the whole; they are easily digestible, more so perhaps than are the vegetable proteids. Amongst the proteid fibres of the meat a certain amount of fat is generally lodged, and here and there it is collected in larger masses. The percentage quantity varies immensely, but even in lean meat there is on an average 2 per cent. of fat present. The extractives of meat are valuable stimulants of digestion, and the salts, chiefly chlorides and phosphates, are very abundant. The flesh of domesticated animals, such as oxen, sheep, and pigs, is especially rich in fat. The same may be said of fowls, ducks, and geese. The flesh of wild animals and birds contains less fat, and very little is ever present in the flesh of fish. The flesh of animals is almost invariably eaten after cooking. In this case the proteids are coagulated, the fibrous tissue of the meat is softened and rendered more digestible, and the savoury qualities of the meat are developed.

Meat may be cooked directly after killing, and in this case it is tender and very palatable. If the animal be kept for even a few hours the meat

becomes hard owing to death coagulation; cooked at this stage it is tough and indigestible; it requires to be kept until it softens again. If kept for some time meat putrefies and becomes high. Game is generally eaten in this condition, and it is readily digested, and admirable in flavour. It is, however, apt to disagree with many people, and even fatal consequences may follow its consumption. High meat is putrid meat; the proteids have in part decomposed, but the remainder is partly in the very digestible form of a peptone proteid. The meat contains microscopic organisms termed Bacteria (q.v.), and is full of their excretions (ptomaines). These ptomaines are in all probability the cause of both the intestinal troubles and the actual poisoning which may follow the consumption of high meat, although at present we are not in a position to say why, under ordinary circumstances, it may be as a rule consumed with such impunity. Their poisonous action seems not to be destroyed by thorough cooking. The same may be said of the fatal consequences which sometimes follow eating fish, lobsters, crabs, and shell-fish which are not as fresh as they should be. In other cases, from as yet unknown causes, mussels, oysters, and other shell-fish produce bad dyspepsia, nettle-rash, and even graver symptoms, although they are eaten perfectly fresh. Many fish, especially during the breeding season, are quite unpalatable or even poisonous, apart from putrefactive changes. These fish are for the most part inhabitants of the tropical seas.

Idiosyncrasy plays a very important part in our selection of animal foods. Many are unable to eat veal, pork, high game, and certain kinds of fish. One medical man known to the writer can eat eggs *à la coque*, but vomited at the smell of a poached egg. Another can only eat freshly killed meat; if it has been hung a day or two, although he cannot distinguish the difference by means of the palate, yet he suffers afterwards from violent diarrhoea.

Diseased meat is always to be avoided, and it is probable that many affections as yet unrecognised are derived from eating the flesh of animals not in perfect health. There is, however, a great difference of opinion on this subject: many authorities at the present day trace even cases of poisoning to the eating of the flesh of animals suffering from black-quarter, smallpox, foot-and-mouth disease, cattle-plague, and anthrax; while it is certain on the other hand that the flesh is frequently eaten without any traceable ill consequences. No ill effects have been proved to follow the consumption of the flesh of pigs suffering from typhus and scarlet fevers. Nevertheless it cannot but be a sound principle to follow, that the flesh of healthy animals should alone be eaten; it is well to err on the safe side. Moreover, no one questions the fact that the flesh of the pig affected with *trichina spiralis* must be avoided. The parasites are not at all readily killed by cooking, and very dangerous febrile symptoms are produced by the action of the young trichina which wander into the tissues. Tapeworm is also produced by the consumption of the flesh of the pig and ox, although if the flesh be thoroughly cooked the danger is greatly diminished.

Bones of animals are very important articles of food. In the interior of the shafts one finds the yellow marrow, consisting of fat of a very savoury taste. At the ends of the bones is situated the red marrow, which is practically devoid of fat, but is rich in nitrogenous extractives. The whole bone, too, is porous, and boiling is able to extract from its interior a rich supply of nitrogenous extractives. Hence bones are useful for making soups, which we may look upon as hot decoctions of salts and extractives, having a useful stimulating

action, but not of any great nutritive value, unless thickened by the addition of pieces of meat or vegetables, which should be served up with the soup. The bone itself consists of a gelatin-yielding substance termed *collagen*, which is chemically united with earthy inorganic salts. This gelatin may be removed by prolonged boiling, and is used for making jellies, and for various other purposes.

**Cereal Grains.**—These are very important articles of food, and are largely used by mankind in nearly all parts of the globe. The most important cereal grains are those of wheat, oats, rye, barley, rice, and maize. They form very condensed articles of food, containing little water, and consisting of highly nutritive solid matter. They all contain an abundance of starch, together with smaller quantities of dextrine and sugar. Proteid matters are also present in no inconsiderable amount, consisting chiefly of insoluble substances, such as gluten-casein, gluten-fibrin, gliadin, together with some soluble albumen. The cereals are as a rule deficient in fat and salts.

**Wheat-flour and Bread.**—Wheat is rich in albuminous matter, containing about 12 per cent. It contains about 70 per cent. of starch, and very little fat. The grain is crushed and separated into flour and bran. With the loss of the bran the flour loses some fat, salts, and nitrogenous matter; on the other hand, bran is irritating to the digestive mucous membrane. Whole-meal bread is therefore more nourishing, but is apt to disagree.

If flour be mixed with water it forms a sticky dough or paste. This consists of gluten, a nitrogenous substance of a sticky nature, by which the granules of starch are held together. On heating this dough, with or without admixture of eggs, milk, &c., pastry, biscuits, &c. are made. Macaroni is made by forcing dough through small apertures during the application of heat. Bread is dough inflated with carbon dioxide, which gas may be generated in the dough itself, or may be driven into it by pressure. Yeast has the property of converting sugar into alcohol and carbon dioxide. If therefore yeast be mixed with dough which contains a little sugar, this ferments, and the carbon dioxide causes the dough to swell up. Baking powders are used for the same purpose; they consist of substances which yield carbon dioxide during the baking process. In Dauglish's process carbon dioxide is forced into the bread under pressure, and bread so prepared is termed 'aerated.' When flour is converted into bread much of the starch is converted into the more easily digested dextrine, and the albumens are coagulated and otherwise changed. It is rendered soft and open, readily permeable by the digestive juices. One hundred pounds of flour yield about 135 lb. of bread.

**Oats and Oatmeal.**—Oats have this advantage over wheat, that they contain more fat and more saline matter. They may be looked upon on this account as more valuable food, when the diet is limited to a few articles only. They are ground into oatmeal, from which porridge may be made. Oatmeal boiled with a large quantity of water, so as to form a drink, is highly spoken of by Parkes. It is capable of forming a much more sustaining drink than perhaps any other, and is much advocated for the use of labourers, especially for those engaged in harvesting or in other labour, where great exertion has to be made in a short space of time.

**Barley, Maize, and Rye.**—These are very nutritious, the maize containing about 6 per cent. of fat, in addition to albuminous and starchy matter. Rye and barley are apt to produce intestinal irritation.

**Rice.**—This grain is poor in nitrogen, and contains little fatty matter; so that those who subsist

almost entirely upon it are obliged to supplement its deficiencies by admixture with fat, and with proteid matter either in the form of milk or legumes. It should not be cooked by any boiling process, inasmuch as during the process it loses much of its nutritive value, the albumens being in part dissolved away. It should be steamed in preference.

**The Legumes or Pulses.**—These include the peas, beans, and lentils. They are distinguished by containing large quantities of nitrogenous matter, and accordingly their chief utility is to supplement the deficiencies of starchy and fatty food. They are eaten with rice in India, and in England they form a favourite dish—'beans and bacon'—equivalent to the 'baked beans' of New England. The Mexicans, however, are the greatest consumers of beans (*frijoles*) in the world, although this vegetable is nearly equally popular throughout Central America; and the *gubanco*, or chick-pea, fills the place of the potato in Spain. Lentil soup is a valuable food. The pulses are not readily boiled, and are not digested very easily.

**Vegetable Roots.**—Vegetable roots and tubers yield abundant food to man, of a highly nutritive quality, and containing as a rule a large quantity of starchy matter. The potato is one of the most important tubers. As it contains little nitrogenous and fatty matters, these must be added when the diet consists largely of potatoes. This tuber should be steamed rather than boiled; it is very digestible, especially when not too young. Since 1845, the year of the great potato disease, the plant has deteriorated, and, some maintain, is a less nutritive food than it had previously been. Arrow-root, which consists almost entirely of starch, and is largely adulterated with other forms of starch, cannot be considered in any other light than that of a single food-stuff, and in consequence it must always be used as an addition to other foods. The same remark applies to Tapioca (q.v.), and to sago, although this latter is obtained not from a root, but is cut away from the centre of the stems of several kinds of palm-trees. Other roots are the Jerusalem artichoke, containing sugar and nitrogenous matter, and turnips, carrots, and parsnips, containing starch, sugar, and a small quantity of nitrogenous matter. Beet-roots, mangold-wurzels, and radishes are all succulent roots, containing both starch and sugar.

**Vegetables.**—The most important vegetables are members of the cabbage tribe, amongst which may be mentioned the common cabbage, the red cabbage, cauliflower, Brussels sprouts, various kales, and broccolis. These have not a very high nutritive value, but they supply the economy with useful salts, and are in consequence very highly antiscorbutic. Much the same may be said for the lettuce, onion, mustard, cress, endive, &c.

**Fruits.**—These are of value chiefly on account of the sugar and vegetable acids they contain. The sugar is in a form which is readily absorbed; and, on account of the large quantity of vegetable acids, they have a very important antiscorbutic action.

**Nuts,** such as cocoa-nuts, walnuts, Brazil-nuts, are rich in oily and nitrogenous matter. They are not easily digested, however.

**Beverages.**—Water is the main constituent of every beverage. Most beverages contain solid matter, either in solution or in a state of suspension. We may divide beverages into nutritive and stimulating, the most useful ones combining both these properties. Perhaps the most important nutritive beverage is milk. It contains all the necessary food-stuffs, as is shown by the fact that the newly-born child can thrive on it alone. Its percentage composition is nitrogenous matter, 4 per cent.; fat, 4; milk-sugar, 5.2; salts, .8; water, 86

per cent. The composition varies in different breeds of cows. The Alderney cow yields a milk that is very rich in fat, while the milk of the long-horned cow is rich in casein. It varies too with the pasturage, and may even acquire poisonous properties. The peculiar taste of the milk from cows fed on turnips is well known to every one. The milk of the ass may frequently be taken by persons who are unable to digest cow's milk. Cream consists of the fat of milk, and is obtained by allowing freshly drawn milk to stand for some hours. The lighter cream floats to the surface, and may be removed. The name 'skimmed milk' is applied to the residue after removal of the cream. Butter-milk contains less fat than does skimmed milk. It is, however, of important nutritive value, as it contains much nitrogenous matter, salts, and sugar.

*Tea, Coffee, and Cocoa* are restorative beverages having a stimulating action. They have little nutritive value unless taken with milk and sugar. Tea contains an astringent substance—tannin, which causes the rough taste experienced when it is drunk without milk. The addition of a few drops of the latter substance prevents its astringency, by precipitating the tannin as an insoluble albuminous tannate. It should be made by pouring boiling water over the leaves; if the leaves are boiled in water they lose their aroma, and much astringency is developed. On account of its astringency tea slightly impedes digestion and lessens the action of the bowels. Theine is the active principle. Coffee has, roughly speaking, the same composition as tea. Its active principle is *caffeine*, and it contains a tannic compound and a characteristic volatile oil. As a beverage it is stimulating; but it retards digestion and the action of the bowels. Like tea, it is said to prevent tissue waste, and it increases the action of the skin. Cocoa is much more nutritive than either tea or coffee, as it contains starch and a large quantity of fat and proteid matter. Chocolate is prepared by adding sugar and flavouring matter to the cocoa. See also KOLA.

*Alcoholic Beverages.*—Alcohol is an article of food of some nutritive value, though perfect health is compatible with total abstinence (see ALCOHOL). Alcohol is undoubtedly oxidised within the body, although if taken in any quantity the excess is eliminated. Taken in reasonable quantity it stimulates the action of the heart, and probably raises slightly the temperature of the body; but it retards to some slight extent the action of the gastric juice. It is also a mental stimulant, producing exhilaration. In many alcoholic beverages a large quantity of saccharine matter is present, and these may in consequence hold a place as possessing high nutritive qualities. Such are beer and porter. Bitter principles, when present, as in beer, are gastric stimulants, and probably assist digestion by increasing the secretion of the gastric juice.

*The Economics of Food.*—In temperate climates when a pastoral people turn their attention to agriculture they become to a great extent vegetable feeders. Their diet no longer consists chiefly of the flesh and milk of animals, but in addition includes the use of a large proportion of grains, pulses, and other vegetable food-stuffs. The agricultural race in time displaces the pastoral one, for several reasons. In the first place, the very fact that the art of agriculture has been acquired indicates a greater mental development, certain to exercise its full weight in the struggle for existence. In addition, however, there is another and an equally potent reason. Vegetable matter is, and must always be, more economical as a food-stuff than animal matter. A given area of soil must always yield food-stuffs of a more nutritive value if that soil has been used to cultivate

vegetables such as corn, oats, &c., to be eaten directly by man, than if it be used for the maintenance of any animal kept for the subsequent nutrition of man. The reason is very simple. A vegetable has a certain nutritive value—i.e. it will yield when eaten so much muscular energy, &c. If eaten by man it will directly administer to the energy of his body, and his muscles and brain will be nourished by it. If it be given to an ox part will no doubt go to the nourishment of the ox, and then, if the ox be eaten, to the nourishment of the man. The greater part, however, will be consumed by the ox to obtain materials for its *own* energy. Every step it takes, the perpetual movement of its jaws in chewing, the whisking of its tail to chase away a fly, these are all deductions to be made out of the nutritive value of its food, and the residuum alone, and that a comparatively small one, is what is obtained when the ox is consumed. So truly is this understood by practical men that they try to minimise these deductions to the greatest possible extent. They prevent as much movement as possible on the part of the animals to be used as food, penning up the poultry, and placing the pig, naturally an active and intelligent animal, within the confines of a sty. In order that the animal may be compelled by a process of exclusion to devote itself entirely to feeding and to furthering the development of fat, it is rendered asexual by an operation which is in a high degree painful. Nevertheless, these deductions are only minimised in some degree, and it will ever be impossible to get rid of them altogether. It follows, therefore, from what we have said that, at any rate in a thickly populated country, it is an economy to go straight to the vegetable world for food rather than to consume the flesh of animals. The high price of meat is an indication of what has just been alluded to. There is a loss in converting vegetable into animal produce, and the value of the latter rises in proportion to that loss. Life may be very cheaply sustained on vegetable produce, such as bread, oatmeal, pease, &c. The cost of animal food is two or three times as great in the case of milk, cheese, and butter, and about twelve times as much in the case of beef, veal, ham, &c. According to Frankland, if an average man were to confine himself to one article of diet he would require, to support life from day to day, 5·068 lb. of potatoes; 1·156 lb. of Cheshire cheese; 1·335 lb. of pease; 1·341 lb. of ground rice; 2·345 lb. of bread; 3·532 lb. of lean beef; 4·300 lb. of lean veal; 6·360 lb. of whiting; 8·745 lb. of white of egg; 2·209 lb. of hard-boiled egg; 9·865 lb. of carrots; 12·020 lb. of cabbage; 4693 lb. of butter; 555 lb. of beef fat; 6½ bottles of stout. It is not, of course, supposed that healthy existence can be maintained on one or two food-stuffs alone; the diet should be varied as well as plentiful, and in order to be economical it must be drawn largely from the vegetable world.

The various countries of the world differ very widely in regard to their power of producing within their own borders food and to spare for all their inhabitants. The United States is the most conspicuous example of a country which raises in superabundance the essential food-stuffs required by its own people, and has of many kinds a large surplus available for export. Few European countries save Russia are self-sufficing in this way. Great Britain is the most notable example of a country which is very largely dependent on foreign countries for the food of its people, and to an over-increasing extent. At the beginning of the 19th century, according to Mulhall, the grain imports into the United Kingdom did not exceed 4 million bushels annually; in 1851-60 they had risen to 78 millions; in 1871-80, to 229 millions. Mean-

while the home production of grain had fallen, being in the decade 1871-80 about 345 million bushels. In the years 1880 to 1888 the imports of wheat alone varied from 90 million to 112 million bushels, while the production in 1888 was only 72 million bushels. The total food imports, including wheat, meat, butter, cheese, sugar, tea, coffee, rice, and eggs, increased from 2271 thousand tons to 5506 thousand. Great Britain imports about 37 per cent. of the meat consumed, 53 per cent. of the cheese and butter, and 61 per cent. of the wheat required. It may be said that Great Britain obtains nearly one-half of its food-supplies from abroad. These food imports are mainly from the United States, Russia, Germany (Denmark); after these, from Canada, India, and Australia. The imports of Indian wheat have greatly increased of late. In 1867 the total value of imports of live animals, meat, butter, cheese, eggs, wheat, flour, grain, hops, sugar, fruits, nuts, and vegetables was £78,611,416, or £2, 11s. 9d. per head of population; in 1883 it was £157,520,797, or £4, 8s. 6d. per head. In some of the years 1883-88, the average per head fell again as low as £3, 1s. 6d. or £3, 4s. 1d.

While Britain has been becoming more and more dependent on foreign countries, the United States has largely increased its surplus available for export. In 1821 to 1840 the United States exported on an average 6 million bushels yearly; in 1851 to 1860, 20 millions; in 1871 to 1880, 147 millions; and since then as much as 285 millions in one year. The grain exports from the United States to Great Britain alone in the years 1833 to 1887 varied from 43 millions of ewts. to 60 millions, with a value of from £20,000,000 to £29,000,000.

A circumstance that has enormously affected the imports from the United States into Britain is the extraordinary reduction in the cost of ocean transit between New York and Liverpool. Thus, while in 1880 each bushel of grain had to pay 9d. for the transit, in 1886 one penny carried it all the way; and the cost of carrying a ton of flour fell in these years from 25s. to 7s. 6d.

However great be the advantage to Great Britain in having access thus freely to the best markets of the world, there is one aspect of the consequent dependence upon foreign countries which tends to cause misgivings. What could a country dependent for nearly one-half of its food-supplies on foreign countries do in time of a war with a great state, even if it were not one of those on which it was directly dependent? Assuming that the navy could prevent anything in the way of a complete blockade of the shores of Great Britain, still privateers might seriously hinder the access of necessary food; food cargoes might have to be transferred from British to foreign bottoms, and the consequence might be a swift rise to famine prices. The issues of a great war are, of course, incalculable; but it has been pointed out that it would be well for Britain to minimise the disadvantage, in view of such possibilities, by developing as far as possible the food-raising and food-exporting resources of her own colonies, while diligently striving by improved agricultural methods to make every acre at home raise as much more food for man and beast as is possible.

See the articles DIET, DIGESTION, COOKERY, NUTRITION, and the books there quoted, as also the separate articles in this work on ALCOHOL, BEER, BREAD, CHOCOLATE, COCOA, COFFEE, WINE, &c.; for the subject of adulteration of food, see ADULTERATION; and on food generally such works as Pavy, *Food and Dietetics* (1875); Thompson, *Food and Feeding* (1886); Blyth, *Foods: their Analysis and Composition* (1881); and works on Food by Hassall (1876) and Letheby (1882).

**Fool.** See JESTER.

**Fools, FEAST OF.** The Romans kept the festival of Saturn, in December, as a time of general license and revelry. During the brief season of the Saturnalia (q.v.) the slave reclined on his master's seat at table, the master waited upon his slave, and society for the moment seemed to be turned upside down. The grotesque masquerade survived the pagan creed which gave it birth, and not only kept its place among the Christians, but, in the face of solemn anathemas from fathers and councils, found its way into the ceremonial of the Christian church. It was called, at different times and places, by many different names, but latterly came to be best known as the Feast of Fools (*Festum Fatuorum*, *Festum Stultorum*). The rites practised varied greatly, but were everywhere marked by the same spirit of broad, boisterous drollery, and coarse but not ill-natured caricature. The donkey played such a frequent part in it that the pageant was often called the Feast of Asses (*Festum Asinorum*). In some places the ass of Balaam was figured; in others, the ass which stood beside the manger in which the infant Saviour was laid; elsewhere, the ass on which the Virgin and Child fled to Egypt, or the ass on which Jesus rode into Jerusalem. In every instance there was more or less attempt at dramatic representation, the theatre being generally the chief church of the place, and the words and action of the drama being often ordered by its book of ceremonies. Several rituals of this sort are still preserved: that which was in use at Beauvais, in France, has a rubric ordering the priest when he dismisses the congregation to bray three times, and ordering the people to bray three times in answer. As the ass was led towards the altar he was greeted with a hymn. Where the ass did not come upon the stage the chief point of the farce lay in the election of a mock pope, patriarch, cardinal, archbishop, bishop, or abbot. These mimic dignitaries took such titles as 'Pope of Fools,' 'Archbishop of Dolts,' 'Cardinal of Numskulls,' 'Boy Bishop' (q.v.), 'Patriarch of Sots,' 'Abbot of Unreason,' and the like. On the day of their election they often took possession of the churches, and even occasionally travestied the performance of the church's highest office, the mass, in the church's holiest place, the altar. In some convents the nuns disguised themselves in men's clothes, chanted mock services, and elected a 'little abbeſs,' who for that day took the place of the real abbeſs.

The Feast of Fools maintained itself in many places till the Reformation in the 16th century. At Antibes, in the south of France, it survived till the year 1644, when we have it described by an eye-witness in a letter to the philosopher Gassendi. The scene was, as usual, a church; and the actors, dressing themselves in priests' robes turned inside out, read prayers from books turned upside down, through spectacles of orange-peel, using coal or flour for incense, amid a babblement of confused cries, and the mimic bellowings of cattle, and grunting of pigs. See Tillot, *Mémoires pour servir à l'Histoire de la Fête des Fous* (Lausanne, 1741), and Schneegans in Müller's *Zeitschrift für Deutsche Kulturgeschichte* (1858).

**Fool's Parsley** (*Ethusa Cynapium*), an umbelliferous plant, common as a weed in gardens and fields in Britain, and in most parts of Europe, somewhat resembling parsley in its foliage and general appearance, so that serious accidents have occurred from its being mistaken for that herb; for it is a poisonous plant, somewhat resembling hemlock in its properties. With the curled variety of parsley it cannot easily be confounded; the leaves are smaller and glossy, and have a disagreeable garlic-like odour when rubbed. The growth is annual, but at first more rapid than that of true

parsley. When in flower it is readily known from every other plant in British gardens by its umbels wanting general involucre, but having upon the secondary umbels partial involucre of three slender leaves hanging down on one side.

Fool's Parsley  
(*Aethusa Cynapium*):  
a, umbel.

supposed resemblance to the dice used by the Romans. Above, it articulates with the two bones of the leg, the *tibia* and *fibula*, and through these bones the whole weight of the body is thrown upon the two *astragali*. Below, it is connected with and rests upon the *os calcis*, or heel-bone, which is the largest bone of the foot. Immediately in front of the astragalus, and supporting it in this direction, is the *scaphoid* or boat-like bone.

Fig. 1.—Bones of the Foot and Ankle :

a, tibia; b, fibula; c, astragalus; d, os calcis, or heel-bone; e, scaphoid bone; f, g, h, the internal, middle, and external cuneiform bones; i, cuboid bone.

In front of the scaphoid bone are the three *cuneiform* or wedge-shaped bones; and on the outer side of the cuneiform bones, and in front of the os calcis, is the *cuboid* bone. We see from fig. 1 that the front row of tarsal bones is composed of the three cuneiform bones on the inner side of the

foot, and of the cuboid bone externally. There are five metatarsal bones passing forward, one for each toe. Each cuneiform bone is connected with one, and the cuboid bone with two, of these metatarsal bones. Behind, they are close together, but as they run forward they diverge slightly from one another, and their anterior ends rest upon the ground and form the *balls* of the toes. They constitute the forepart of the instep. The remaining bones are those of the toes, and are named the *phalanges*, each toe having three of these bones, excepting the great toe, which has only two. (A similar law holds for the bones of the hand, each finger having three phalanges, but the thumb only two.)

The instep is composed of the seven tarsal and the five metatarsal bones, which are so arranged and connected (see fig. 2) as to form the *plantar* arch from the extremity of the heel-bone to the balls of the toes. The astragalus forms the summit or keystone of this arch, and transmits the weight which it receives back to the heel, and forward to the balls of the toes.

The bones where they articulate with one another are covered with a tolerably thick layer of smooth cartilago, and by this means, together with the very slight movements of which each bone is

Fig. 2.

Section through the lower end of the tibia a, and through the astragalus b, the heel-bone c, the scaphoid bone d, the internal cuneiform bone e, and the bones of the great toe f.

capable, a degree of elasticity is given to the foot, and consequently to the step, which would be altogether wanting if the plantar arch were composed of one single mass of bone. This elasticity is far greater in the anterior pillar of the arch, which is composed of five comparatively long bones sloping gradually to the ground, than in the posterior pillar, which is short, narrow, and composed of a single bone, which descends almost vertically from the ankle to the ground. Hence, in jumping from a height, we always endeavour to alight upon the balls of the toes, and thus break the shock which we should feel if by accident we descended upon the heels.

The bones of the foot are held together by short ligamentous bands of great strength. These are attached to the non-articular surfaces of the bones, and are arranged mostly on their *plantar* and *dorsal*—i.e. upper—surfaces, while others are situated between bones, and are hence named *interosseous*. So resistant are these ligaments that it is almost impossible to dislocate the bones which they hold together.

The spot over which the inferior calcaneo-scaphoid ligament extends is the weakest in the foot, the astragalus being there unsupported by any bones; additional support is, however, afforded where it is more required by the tendon of a strong muscle, the *posterior tibial* (fig. 3, B), which passes from the back of the tibia (the chief bone of the leg) round the inner ankle, to be inserted into the lower part of the inner surface of the scaphoid bone. It not unfrequently happens that the astragalus, being either insufficiently supported, or from

its being overweighted, descends slightly below its proper level, causing a lowering of the arch and a flattening of the sole of the foot. The defect when slight is known as 'weak ankle'; when more decided it is termed 'flat-foot'; and in extreme cases the bone may descend to such an extent as even to render the inner side of the foot convex when it naturally should be concave.

In the movements of the foot upon the leg we see a striking combination of variety of movement with general security. This combination is effected by the harmonious action of three joints, each of which acts in a direction different from the others. The first of these joints is the ankle-joint, which is formed by the bones of the leg—the tibia and fibula—above, and the astragalus below. At this joint the movements of *flexion*—i.e. approximation of the toes to the knee, and *extension*—i.e. pointing the toes to the ground, take place. The second joint is between the astragalus and the heel-bone, and it permits the foot to be rolled inwards or outwards; while the third joint is between the first and second row of tarsal bones—viz. between the astragalus and os calcis behind, and the scaphoid and cuboid bones in front—and allows the degree of curvature of the plantar arch to be increased or diminished within certain limits. The following is the order in which the movements of these three joints occur: the raising of the *heel* (by the first joint) is accompanied by a rolling of the foot inwards (by the second joint), and by an increased *flexure* of the plantar arch (by the third joint); and the raising of the *toes* is accompanied by a rolling of the foot outwards, and a *straightening* of the sole.

The joints, however, merely allow of movements; they do not effect them: this is the special function of the muscles; and each of the three movements we have indicated is effected by special groups of muscles. The principal of these muscles are shown diagrammatically in figs. 3 and 4, representing the inner and outer sides respectively. The first series of movements is mainly effected by three muscles: viz. (1) *muscles of the calf* (fig. 3, A), attached above to the thigh and leg, and below by the *Tendo Achillis* to the heel-bone; (2) the *posterior tibial* (fig. 3, B), attached above to the tibia, and below by its tendon to the scaphoid bone; and (3) the *short fibular* (fig. 4, C), attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf-muscles, whose tendon is inserted into the heel-bone, are large and very powerful, for in raising the heel they have to raise the weight of the body. The other two muscles, the posterior tibial and the short fibular, turn round the inner and the outer ankle respectively, and are inserted into the inner and the outer edges of the instep; the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist in raising the ankle, but support it laterally. The muscle whose tendon is on the inner side of the foot (the posterior tibial)

effects the two movements which are associated with the raising of the heel-bone—viz. the turning of the foot inwards and the increased flexure of the arch.

The second series of movements—the raising of the toes, the turning of the foot outwards, and the straightening of the sole—are effected by two muscles, the *anterior tibial* (fig. 3, F) and the *third fibular* (fig. 4, G), whose tendons pass, one in front of the inner ankle, and the other in front of the outer ankle, to the corresponding edges of the instep, and are inserted into the internal cuneiform and the outer metatarsal bones. These muscles are direct flexors of the tarsus upon the leg; the former raising the inner, and the latter the outer border of the foot.

Another point in the anatomy of the foot that requires notice is the mode of union of the meta-

Fig. 4.

A, the gastrocnemius and soleus muscles, forming the muscles of the calf; a, the *Tendo Achillis*; B, the posterior tibial muscle; b, its tendon; D, the inner ankle; F, the anterior tibial muscle, attached above to the front of the tibia, below to the internal cuneiform bone; k, the flexor tendon of the great toe.

(fig. 3, B), attached above to the tibia, and below by its tendon to the scaphoid bone; and (3) the *short fibular* (fig. 4, C), attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf-muscles, whose tendon is inserted into the heel-bone, are large and very powerful, for in raising the heel they have to raise the weight of the body. The other two muscles, the posterior tibial and the short fibular, turn round the inner and the outer ankle respectively, and are inserted into the inner and the outer edges of the instep; the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist in raising the ankle, but support it laterally. The muscle whose tendon is on the inner side of the foot (the posterior tibial)

tarsal with the tarsal bones. In these joints in the fourth and fifth toes a slight revolving motion can take place, which probably enables the outer metatarsals to adapt themselves to inequalities of the ground, and to equalise the distribution of the weight which is thrown upon the foot; while, in the corresponding joints of the three inner toes, scarcely any motion can occur—a provision by which additional strength is given to the inner side of the foot, upon which the weight of the body most directly falls.

The skin of the sole is very tough and strong; and intervening between it and the bones and the strong fascia of the sole of the foot is a thick pad of fat, which acts the part of an air or water cushion in defending the adjacent parts from injurious pressure, and in deadening the jars and shocks that would otherwise be felt in leaping, &c.

A few remarks on the subject of shoes may here be added. The shape of the sole of the natural foot is shown in fig. 5, while the shape after the prolonged use of a badly-made shoe is given in fig. 6. In the foot in its normal state the great toe is seen to be free from the others, and the line of its axis prolonged backwards passes through the centre of the heel; while in the foot distorted by the use of the shoe the line of the great toe is quite altered, and the toes generally—not being able to find room side by side—overlap each other

Fig. 5.

Fig. 6.

and lose their separate and individual actions; corns, bunions, and ingrowing toe-nails being the natural consequence of this maltreatment. Meyer

ing the usual  
shape.

of Zurich drew attention to the bad treatment which the foot receives from ordinary shoemakers, and pointed out that the great toe should be allowed to have its normal position, and this can be done by making the inner edge of the sole incline *inwards*, instead of *outwards*, from the balls of the toes. The accompanying figure (7) gives the outline of a shoe designed under Meyer's superintendence, and shows the difference between it and the usual shape; the latter being indicated by the dotted outline. High heel-pieces tend to make the step less steady and seeme, to break down the arch of the foot, to shorten it, and to impair the action of the calf-muscles. A high heel-piece, moreover, places the forepart of the foot at a lower level than the heel; the weight is thus thrown too much in the direction of the toes, and they are thrust forward and cramped against the upper leathier of the shoe.

If we compare the human foot with the feet of other mammals we find that it presents certain peculiarities, all of which have reference to man's erect posture. The chief peculiarities are (1) the greater relative size of the tarsal bones as compared with the other bones of the foot, and the more perfect formation of the plantar arch, which is higher and stronger than in any of the lower animals. Strength and elasticity are thus combined in the human foot in the highest degree. (2) The great toe is remarkable in man for its size and strength, and for the firm manner in which its metatarsal bone is joined to the other bones so as to render it the main support to the foot. (3) If

Fig. 8.  
Foot of Gorilla.

we compare the human foot with that of the gorilla (fig. 8) or any other Anthropoid Apo (q.v.) we see that the toes are short and small in man in relation to the other parts of the foot, while in the gorilla the toes form the greater part of the foot. Indeed, a reference to fig. 8 shows that the organ in question is rather a *hand* than a *foot*, and hence the term *quadrumanous* as applied to this class of animals. There is scarcely any plantar arch, and the weight of the body bears chiefly on the outer edge of the foot; the digits are long and strong, and the inner one diverges so as to form a thumb rather than a great toe.

It remains to notice some of the most marked varieties of form which the bones of the foot present in mammals. In the following group of figures the same letters are attached to the same bones. Thus, *a* marks the astragalus; *cl*, the calcaneum or heel-bone (the posterior projection of which forms the hock of the horse); *s*, the scaphoid; *b*, the cuboid; *ce*, the ecto- or outer, *cm*, the meso- or middle, *ci*, the ento- or internal cuneiform. Now, as a general rule in all mammals, the ecto-cuneiform supports the third or middle of the five toes when they are all present, the meso-cuneiform the second, and the cuboid the fourth and fifth. Bearing in mind this law,

we see that the large bone in the horse, known as the cannon-bone, which is articulated to the

Fig. 9.—Horse. Fig. 10.—Ox.

in the horse we have only one toe, the third, sufficiently developed to reach the ground, with mere traces of a second and fourth toe on either side. In the foot of the ox the cuboid, *b*, is relatively larger than in the horse, and is equal in size to the ecto-cuneiform, *ce*. The cannon-bone articulates with both these tarsal bones, and hence answers to the metatarsal bones of both the *third* and *fourth* digits; it is accordingly found to consist of two distinct bones in the foetus; and in the adult it is divided internally into two cavities, and its original separation is marked out by an external elongated ridge.

Fig. 11.  
Rhinoceros.

Fig. 12.  
Hippopotamus.

Fig. 13.  
Elephant.

At the lower end are two distinct joints for the phalanges of the third and fourth toes. While in the horse we had the rudiments of the *upper* parts of two toes (the second and fourth), in the ox we have the rudiments of the *lower* parts or phalanges of two toes (the second and fifth), forming the 'spurious hoofs,' and marked 2 and 5 in the figure. In the rhinoceros there is one principal toe (the third), as in the horse, with the second and fourth toes in a less developed state; while in the hippopotamus there are two principal toes (the third and fourth), as in the ox, with the second and fifth toes not fully developed. In the elephant there is a fifth digit added, answering to our great toe, and articulating with an ento-cuneiform bone, so that in the foot of this animal we have all the bones occurring in the human foot. Owen concludes from these and similar observations that the course of the simplification of the five-toed foot is, first, a diminution and removal of the innermost toe; next, of the outermost; then, of the

second; and lastly, of the fourth; the third or middle toe being the most constant and (in the lower animals) the most important of the five.

**Foot**, the most common unit of lineal measure all over the world, was taken originally from the length of the human foot. The three foot-measures that occur most frequently are the Paris foot or *pied de roi*, the (German) Rhenish foot, and the English. Compared with the French *mètre* (= 3·28090 English feet) they stand thus:

|              | Mètre.  |              | English Inches |
|--------------|---------|--------------|----------------|
| English foot | 0·30479 | Paris foot = | 12·7912        |
| Paris "      | 0·32484 | Rhenish "    | = 12·3652      |
| Rhenish "    | 0·32855 |              |                |

In round numbers, 46 Paris feet = 49 English feet, 34 Rhen. or Ger. feet = 35 English, and 57 Paris feet = 59 Rhenish. The Russian foot is almost exactly equal to the English. Many local feet are only about 10 inches. The foot has almost uniformly been divided into 12 inches, and the inch into 12 lines (often, however, into tenths). The French *pied usuel* is the third part of the *mètre* (see YARD, *MÈTRE*). In Music a foot is the short figure with one accent, and in *Mètre* (q.v.) a certain number of syllables (dactyl, iambus, &c.).

**Foot-and-Mouth Disease.** See MURRAIN.

**Football.** Probably no game has ever been able to count upon so much popularity and so many opponents at one and the same time as the now great English winter pastime of football. When it was first played it is impossible to say, but in one form or another the game has existed for very many centuries, in spite of an amount of opposition that would have completely extinguished a less attractive form of exercise. As in the case of cricket, and indeed many other ball games, opinions are divided as to whether football sprung up on English soil or was an importation. The Greeks had a game to a certain extent resembling football, which was played with the kind of ball known as *harpaston*, and one set of players had to force the ball into that portion of the ground guarded by a rival team in any way they chose. Amongst the Romans, too, there was a game played with a large inflated ball, the *fellis*; and, though it is evident this was only struck with the hand, yet the ball used was undoubtedly similar to the football of later years. No trace of the game as at present understood has, however, been discovered beyond the limits of Britain, where it has flourished for centuries. That football in its early days was played with a boisterous vigour that very closely approached brutality, and often led to breaches of the peace, ample proof is adduced by the numerous attempts made to prohibit it. As early as 1314 a proclamation was issued by Edward II. forbidding the hustling over large balls (*ragaries de grosses pelotes*), which it is to be presumed had reference to football. In 1349 the game, designated in the statute by its present name, was objected to by Edward III.; and similar measures were adopted with a view to its suppression by Henry IV. (1401) and Henry VIII.; while during the reign of Elizabeth the game was forbidden upon pain of imprisonment. Despite these prohibitive measures and much hostile criticism, football continued to be regularly pursued by the people at large until the middle of the 17th century, when it began to decline in popularity, the change being due possibly to the influence of Puritanism. It was not, however, allowed to die out altogether, and after being kept alive by the younger generation it ultimately became a regular item in the public school curriculum. This flame was fanned by the athletic revival of the 19th century, and it is now an open question whether

the votaries of football do not outnumber those of cricket.

The description of game played in the early ages was like that of the present day in that it consisted in forcing the ball through goals which were then defined by objects dependent upon the spot where the game was decided. The ball at the start was placed as now midway between the two goals, and each side, consisting of any number of players, endeavoured to gain the upper hand by any device or strategy. The game was played either in the street, on a field, or 'across country,' when in some instances the goals were several miles apart. Shrove Tuesday was the great football day. Until 1540 a game took place annually on this day on the Roodee, at Chester, and in some parts of England a game similar in character is still indulged in. The ball was kicked or thrown at the discretion of the player, and in the struggle to gain or retain possession of the ball there was some exceedingly rough work. A description of such a contest played as recently as 1888 was given in *The Field* of March 3 of that year. Joseph Strutt, writing in 1801, describes the game of that time, and by its close affinity it is evident that this was the prototype of the old hacking and tripping game, an early development of Rugby Union football.

Football at the public schools was and is still of very varied character, the rules of the game having, as an admirable authority has suggested, been probably drawn up to suit the capacity of the playground. Where the ground, as at Rugby School, took the form of a large meadow, there running with the ball, the consequent tackling or collaring, and the rough tactics adopted in the primitive game could be indulged in without fear of serious danger; but not so in the circumscribed and more general kind of playground, with, in many cases, its flagged pavement. Here it was necessary that the rougher element should be eliminated; and hence arose the game in which kicking the ball was alone permissible, to be subsequently known by the name of Association football.

About the middle of the 19th century clubs began to be formed by old public school boys. The Sheffield and Hallam clubs, playing the 'dribbling' or non-handling game, were started in 1857; a year later the celebrated Blackheath Club was formed for the purpose of promoting the 'carrying' game; and in 1858 came the institution of the famous Richmond Club. Others of course followed, and in 1863 a praiseworthy attempt was made to determine upon one code of rules to govern all players. This attempt failed, but a body, to be ever afterwards known as the Football Association, was in the same year formed by the 'dribbling' clubs, who were numerically stronger than the followers of Rugby. The latter section was content to remain without organisation until 1871, when the Rugby Football Union sprang into existence. Under the management of the societies named, the game has improved and grown in marvellous manner, until it stands unrivalled in Great Britain as a winter pastime. International and all other kinds of matches are played, and so extraordinary is the popularity of football that nearly 30,000 people have been known to attend a single match, while a company numbering 10,000 is by no means a rare occurrence; and since 1888 there have been some clubs organised as limited liability companies, which have declared fair dividends.

The diagram on the following page will give some idea of the field of play.

In Rugby Union football the area for play is usually 110 yards by 75 yards; each goal is composed of two upright posts exceeding 11 feet in height from the ground, and placed 18 feet 6 inches

apart, with a cross-bar 10 feet from the ground. For a match the opposing sides number fifteen each, and are generally disposed of as follows: one full back, three three-quarter backs, two half-backs, and nine forwards. The arrangement of the

AA, goal-posts; BB, goal-lines; CC, touch-lines.  
in the Rugby Union game the four corners outside the lines marking the field of play are known as touch in goal.

side is, however, entirely in the hands of the captain, who may deem it expedient to draw from the forwards for additional strength behind the scrum-mage. The dimensions of the ball are: length, 11 to 11½ inches; length circumference, 30 to 31 inches; width circumference, 25½ to 26 inches. From these it will be gathered that the ball, weighing from 12 to 13 oz., is oval in shape. It is the object of each side to obtain as many tries or goals as possible. At the present time matches in England are decided by a number of points; a goal from a try or drop kick scores three points; from a free kick (penalty for infringement of offside and other rules), two points; for a try, one point is allowed. In other portions of Great Britain a goal counts more than any number of tries, an arrangement which is not of the most equitable kind. A try is gained when a player touches the ball down in his opponents' goal. This is accomplished by a player, when not offside, dodging his opponents and crossing the goal-line at any spot. A player is put offside if he enters a scrum-mage from his opponents' side, or, being in a scrum-mage, gets in front of the ball, or when the ball has been kicked, touched, or is being run with by any of his own side behind him—i.e. between himself and his own goal-line. A side having so touched the ball down, one of the players of the same side must bring it up to the goal-line in a straight line from the spot where it was touched down, and thence walk out with it in a line parallel to the touch-lines such distance as he thinks proper and there place it for another of the side to kick. Should the ball be kicked directly over the cross-bar (not over either post) it is a goal. A goal may, however, be obtained by a drop-kick (made by letting the ball fall from the hands and kicking it the very instant it rises) at any time during the game; or from a place-kick (made by kicking the ball after it has been placed in a nick made in the ground for the purpose of keeping it at rest) or a drop taken as a free kick for a fair catch (a catch made direct from a kick, throw forward, or a knock on by one of the opposite side), or as an award for a penalty.

For Association football the maximum size of ground is 200 yards by 100; the minimum, 100 yards by 50. The most popular dimensions are 120 yards by 80, and for cup tie matches, which are exceedingly numerous, the field of play must not be less than 110 yards by 70. The goal-posts are placed eight yards apart, with a bar across eight feet from the ground. In this game only goals count, and to obtain a goal the ball must be passed between the goal-posts under the bar. No player is permitted to carry (take more than two steps when holding the ball), knock on (strike or propel the ball with hand or arm), or handle (play the ball with hand or arm) the ball under any pretence whatever, except in the case of the goal-keeper, who, within his own half of the ground,

may use his hands in defence of his goal, either by knocking on or throwing, but not carrying the ball. A goal cannot be scored from a free kick—the penalty for handling the ball, offside play, or when a player sends the ball over his own goal-line. The ball in the Association game is of an average circumference of not less than 27 inches and not more than 28 inches. Matches are played between sides numbering eleven each, the players being generally disposed as follows: a goal-keeper, two backs, three half-backs, and five forwards. As at Rugby Union, the greatest factor towards success is the working together of the whole team.

At the present time, even, complaints are frequent that football is associated with a large number of accidents. It certainly cannot be argued that the game is one of gentle character; but it is beyond doubt that the large majority of mishaps occur through the non-observance of those rules which the governing bodies have from time to time drawn up with a view to the elimination of the rough element.

In many parts of the world besides Great Britain football has of recent years spread in a remarkable way, but it has perhaps taken the strongest hold in Australia, New Zealand, and Canada. The latter two countries each sent a team to England in 1888; and in the early part of the same year a body of English football players visited Australasia, and found there opponents quite worthy of them. Two games are played in Australasia, the one being strictly according to the English Rugby Union code, the other a combination of the two styles so well known in Great Britain. In the Victorian or Australasian game, which is played almost universally in Victoria, New South Wales, and South Australia, the ball has to be bounded by the player while running, and in this particular the game differs from both Rugby Union and Association. It is with the New Zealanders chiefly that Rugby Union finds favour, but both games are exceedingly popular with the public, who muster in their thousands at the more important matches. Comparatively little Rugby Union is played either in Canada or the United States, but in both countries the Association game flourishes, the team from the former country which visited England, as mentioned above, proving how assiduous had been their practice. Until the last quarter of the present century football was less known in the United States; but then, under the guidance of the New York and Paterson clubs, the game grew rapidly, and in April 1884 there was formed the American Football Association. From some quarters much opposition was experienced by American admirers of the game, which was voted altogether too rough, but despite opposition it has continued to make headway. It is worth mention that a variety of football is very popular with some Indian tribes, as the Washoes of Nevada.

**Footc,** ANDREW HULL, American naval officer, was born in New Haven, Connecticut, in 1806, entered the navy in 1822, and after some service against the pirates of the West Indies was appointed captain in 1849. In 1856 he gallantly carried by storm four Chinese forts at Canton, from which he had been fired on while protecting American property. On the outbreak of the civil war he equipped and organised the western flotilla, and in February 1862, with his gunboats, he stormed Fort Henry. At Fort Donelson, in the same month, he received a wound which soon afterwards compelled him to resign his command; but his services obtained for him the rank of rear-admiral and a vote of thanks from congress. He died in New York city, 26th June 1863, while on his way to take over the command of the fleet off Charleston.

**Foote, SAMUEL**, English actor and writer of comedy, was born at Truro, in Cornwall, in January 1720. His father at one time sat in parliament for Tiverton, and was mayor of Truro; his mother inherited a considerable fortune from her brother, Sir John Gooden, Bart., who was murdered by another brother. Foote left Worcester College, Oxford, without a degree, and about 1740 entered the Temple; but after wasting his fortune in a career of pleasure he turned to the stage as a means of support, and in 1744 made an unsuccessful debut as 'a gentleman' in *Othello*. In 1747 he opened the Haymarket Theatre—where he was at once director, actor, and dramatic author—with *Diversions of the Morning*. In this and other pieces he introduced well-known living characters, and, by his admirable powers of mimicry, succeeded in drawing large audiences; the theatre was closed by order of the magistrates, but Foote hit on the device of inviting his friends to 'a cup of tea,' for which tickets were to be obtained at the coffee-houses. He appeared in a great number of parts in London, Edinburgh, and Dublin, but would seem to have achieved success almost solely in his own plays. In 1766 he broke his leg by a fall from his horse, and amputation was found necessary. This, however, did not interrupt his career; he even turned the incident to account on the stage, by composing parts expressly adapted to his own state. He died at Dover on 21st October 1777. Many anecdotes of him, though not infrequently borrowed from earlier sources, are given in Cooke's *Memoirs of Samuel Foote* (1805); see also Forster's essay in the *Quarterly Review*, 1854, and the article by Joseph Knight in the *Dict. of Nat. Biog.*, vol. xix. (1889). Of his plays the best are *An Auction of Pictures*, *The Minor*, *The Liar*, and *The Mayor of Garratt*, which have been frequently published.

**Foot-guards**, the flower of the British infantry, and the garrison ordinarily of the metropolis, comprise three regiments, the Grenadier, Coldstream, and Scots Guards. See **GUARDS**.

**Foot-pound** is the unit used to express the work done by any form of force. Thus, taking 1 lb. and 1 foot as the units of weight and distance, if 1 lb. be raised through 1 foot, the work done is equivalent to 1 foot-pound; and generally, if  $W$  represent the work done,  $P$  the weight in pounds, and  $h$  the height in feet, then  $W$  (in foot-pounds) =  $Ph$ .

**Footprints.** See **FOSSIL**.

**Foot-rot** amongst sheep is of two varieties, the commoner consisting of an inordinate growth of hoof, which, at the toe or round the margin, becomes turned down, cracked, or torn, and thus affords lodgment for sand and dirt. Insufficient wearing of the hoof is the obvious cause, and hence the prevalence of foot-rot in soft rich pastures, and especially amongst sheep previously accustomed to bare, rough, or upland walks, where the hoof is naturally worn down by the greater amount of walking necessary to procure sustenance. Taken in time, when lameness is first apparent, and before the hoof is cracked and the foot inflamed, a cure rapidly follows the careful paring of the superfluous and diseased hoof; indeed, further treatment is scarcely necessary unless any of the vascular parts have been laid bare, when a little tar may be applied as a mild astringent and protection from flies. When from inattention or neglect the hoof is separated from the sensitive parts beneath, when ulcers appear on the sole, or proud-flesh springs up, active astringents or mild caustics are necessary. The shepherd's old favourite butter of antimony, diluted with an equal quantity of tincture of myrrh, is a good remedy when cautiously and

temperately used. A convenient paste, which in inexperienced hands is safer than a fluid caustic, may be made with equal weights of flowers of sulphur and finely-powdered sulphate of copper, rubbed up to the needful consistency with lard or oil. Many have great faith in a mixture of the salt of copper with gunpowder and lard.

The second and more troublesome variety is allied to what is termed *foul* in the foot: instead of commencing at the ground surface, it begins in the interdigital space, appears to depend upon constitutional rather than local causes, and frequently occurs along with the other variety, and is supposed to be contagious. The foot is hot, tender and swollen around and immediately above the coronet. There are ulcerations in the interdigital space, and the swelling and subsequently the sprouting of proud-flesh cause a separation of the toes. When the tenderness and heat are great, poultices are advisable; but in the milder cases and earlier stages the parts should be well washed with a solution of chloride of zinc, and in all cases the loose and semi-detached horn carefully removed, the parts thoroughly cleansed before applying the dressing, and afterwards protected by a bandage or a leather shoe well padded with tow. When ulcers appear they must be touched with lunar caustic or dressed with the paste already recommended.

**Foraminifera**, a class of unicellular animals or Protozoa, almost always marine in distribution, most characteristically provided with limy shells, which have formed the chalk of the past and are now forming similar deposits in the deep sea. A living Foraminifer, often about the size of a pin's

A living Foraminifer (*Polystomella strigillata*).

head, consists of a central nucleated mass of protoplasm, of a shell surrounding this, and of long, branched, and interlacing threads of living matter streaming outwards, with food-absorbing and locomotor functions.

**Description.**—The shell, which is much better known than its tenant, is characteristically calcareous, chambered, and covered with minute holes. But it is occasionally chitinous, and often sandy, while a few forms approach Radiolarians in being flinty. At first a simple enough insheathing test, and so remaining in many forms, the shell is very generally added to, so as to cover successive overflows of growth. The ways in which fresh chambers are formed—in linear series, in spirals, and the like—produce types of architecture of great beauty and variety, as to the building of

which we can only conceal our ignorance by calling them organic crystallisations. The spinals often look like miniature sketches of the shells of Nautili, snails, and other molluscs. When partitions are formed between successive chambers they leave apertures through which bridges of protoplasm preserve the vital continuity. On the

Shells of various Foraminifera.

outer surface the outflowing protoplasm may reserve for itself one relatively large aperture, or a couple, or a few, but most characteristically there are numerous minute holes left all over the shell.

The internal protoplasm, so far as observed, is homogeneous, except for granules, frequent pigment, and the essential nucleus or nuclei. On the outflowing processes, which are more irregular and interlaced than is usual in Radiolarians, granules stream outwards and inwards in active currents. The colouring matter often resembles that of the diatoms on which the organisms so largely feed. The general absence of vacuoles, contractile or otherwise, is another of the contrasts between Foraminifera and Radiolarians, and is probably associated with the non-pelagic life of the former. Partner plant-cells or symbiotic algae have been but rarely seen within Foraminifera, whereas they are almost constant in Radiolarians. Multiplication typically takes place by a sort of internal budding. The nucleus divides into several, round each product of nuclear division the protoplasm gathers, and thus are formed young individuals which are eventually enclosed in shells and liberated from the parent. Division of the entire animal has also been observed in a few cases. Dimorphism, or the occurrence of two diverse forms (possibly male and female) in one species, has been noticed, but no conjugation or incipient sexual union. In a few cases—e.g. *Microgromia socialis*—a number of individuals are united to form a loose colony, a primitive kind of association exhibited by not a few Protozoa. Most modern forms are small, below half an inch in diameter, and many very much less, down to microscopic dimensions. The largest living species (*Cyloclypeus carpenteri*) measures slightly over 2 inches across the shell, and recalls the extinct giant Nummulites, many of which were as large as half-crowns.

**Distribution.**—The Foraminifera are mostly marine, and occur at all depths; a few (Globigerinids), like the Radiolarians, are pelagic; most live on submerged objects or at the bottom. A few from brackish and even fresh water are known, and one species (*Gromia tereticaula*) has gone ashore. The pelagic forms as they die sink gently to the bottom, and are there forming,

especially at depths between 1000 and 2000 fathoms, great beds of Globigerina ooze or modern chalk. In other regions sandy-shelled forms predominate at the bottom.

In marine geological strata from the Silurian onwards Foraminifera abound. Chalk consists almost wholly of fossil Globigerinids, and the Nummulites have contributed largely to the great Eocene limestones. The animal nature of Eozoon (q.v.) from the pre-Cambrian strata is now generally denied, and is at least very doubtful.

**Position and Classification.**—The Foraminifera were so named by D'Orbigny in 1826, and placed beside the Cephalopods, to the shells of some of which the tests present a mimetic or prophetic resemblance. The title referred not, as might be supposed, to the superficial apertures on the shell, but to the communications between successive chambers. Hertwig would call them Thalamophora, in allusion to the typical chambered shell; while Carpenter emphasised the living network of processes in the title Reticularia. Accounting as they do the amoeboid phase of cell-life, the Foraminifera have their place beside Amœbe, Radiolarians, and Spongiomorphs in the Rhizopod division of Protozoa (q.v.). They were formerly classified as Perforata and Imperforata according to the presence or absence of numerous apertures on the test, but as this distinction separates apparently adjacent forms it is no longer generally adopted. By Brady, who has described the *Challenger* collection in a monumental monograph, they are classified in ten families, of which Gromia, Miliolina, Astrorhiza, Litolima, Textularia, Chlomonella, Lagena, Globigerina, Retulina, and Nummulites are the name-giving types. In Gromia the shell is chitinous, flexible, and with a single aperture; in the related Siphonardella there is an aperture at each end of an elongated test. The test of Miliolina is normally of lime, but in brackish water tends to become chitinous, and at great depths a siliceous film. Irregular sand particles form the primitive test of Astrorhiza, and the use of detached sponge spicules led to the related Halysæum being mistaken for a very simple sponge. Among Litolidae, Parkeria and Loftusia are relatively large forms—about two inches in diameter and length respectively. A peculiarly interesting *Challenger* form among the pelagic Globigerinids—*Elstigerina murrai*—has the shell surrounded by a zone of bubbly protoplasm, and in its vacuoles and internal shell suggests Radiolarian characteristics. The species of Foraminifera are legion, probably above two thousand. They are interesting, as illustrating complexity and beauty of architecture at the very threshold of life, and important both in the making of the earth and in the present-day economy of submarine life.

See Eozoon, Nummulites, Ooze, Protozoa, Radiolarians; Brady, *Challenger Report*, 1884; Bütschli, *Protozoa* (Bronn's *Thierreich*); Carpenter, Parker, and T. Rupert Jones, *Introduct. to Study of Foraminifera* (Ray Soc. Lond. 1863); Schultze, *Organismus der Polythalamien* (Leip. 1851); and other works cited in Sherborn's *Bibliography of Foraminifera* (1888).

**Forbach**, a manufacturing town of 6842 inhabitants, in Lorraine, 6 miles S.W. of Saarbrück. Here on 6th August 1870 the French had to retreat.

**Forbes**, ALEXANDER PENROSE, bishop, was born in Edinburgh, the second son of Lord Medwyn, a judge of session, 6th June 1817, and spent the years 1837–40 in the East India Company's service, until ill-health compelled his retirement. He graduated at Oxford in 1844, was ordained in the same year, and in 1847, at the early age of thirty, was consecrated Bishop of Brechin, in Scotland, receiving the honorary degree of D.C.L. in 1848. A warm friend of Pusey, he delivered a charge in

1857 which was practically a manifesto on the manner of the Eucharistic Presence and on the nature of the Eucharistic Sacrifice; its publication raised a storm which culminated in its author's trial before the other bishops of the Scottish Episcopal Church in 1860, resulting in a 'declaration of censure and admonition.' Forbes died on 8th October 1875, more widely mourned than any Scottish bishop since the Reformation. He edited, with his brother, the *Arbuthnot Missal* (1864), published with an elaborate preface *Kalendars of Scottish Saints* (1872), and was the author of valuable expositions of the Articles (2d ed. 1871) and Nicene Creed (2d ed. 1866), and of numerous other works, chiefly devotional. See *Memoirs* by Miss Skene (1876) and Canon Mackey (1888).

**Forbes, ARCHIBALD**, special correspondent of the *Daily News*, is a native of Monmouthshire, and a 'son of the manse,' born in 1838. He was educated at Aberdeen University, and served for some years in the Royal Dragoons. But in 1870-71 he went through the Franco-German war as war-correspondent; and thenceforward, whether in Spain with the Carlists, in Cyprus, in the Russo-Turkish campaign, or in the Zulu war of 1879, he accustomed the British public to expect feats of unexampled audacity, swiftness, tact, and pluck in securing and transmitting his vivid first-hand notes of events at the front to his newspaper. A memorable exploit was his famous ride of 110 miles in 15 hours, in order to report at once the victory of Ulundi (1879). He has lectured in Great Britain, America, and Australia, and has written a novel, *Drawn from Life* (1870), *Glimpses through the Cannon Smoke* (1880), and a short life of *Chinese Gordon* (1884).

**Forbes, DUNCAN**, of Culloden, a Scottish politician of the 18th century, and Lord President of the Court of Session, was born either at Culloden or at Bunclewee—for the family possessed both estates—in the neighbourhood of Inverness, on the 10th November 1685. In 1704 he commenced his legal studies in Edinburgh, and completed them at Leyden. On his return from Leyden he was called to the bar, and almost immediately after appointed Sheriff of Midlothian. He rose rapidly into practice and into political influence through his connection with the great Duke of Argyll. During both of the rebellions he acted a prominent part on the side of the Hanoverian government. In 1715 he was in the north actively engaged in opposing the rebels along with his elder brother John. After the suppression of the rebellion he was opposed to the project of carrying the prisoners out of Scotland to be tried by English juries; and he was opposed to the forfeitures also on grounds of policy as well as of humanity. The only effect of his moderation was to bring suspicion on his own loyalty. In 1725 he became Lord Advocate. He was not distinguished as a debater, but he was much employed at this period of his career in appeal cases. In 1734 his brother John died, and he succeeded to the estates of the family. During many subsequent years he largely ruled the destinies of Scotland and contributed to her dawning prosperity by fostering and developing her internal resources. His policy, even before 1745, was to extinguish the rebellious temper by gaining over the Jacobites to the government, and by forming Highland regiments under loyal colonels. Forbes was appointed President of the Court of Session in 1737; but he still continued his interest in the general improvement of the country. Though he was aware of the character and, in general, of the designs of the Jacobites, the rebellion of 1745 took him by surprise. But he was no sooner aware of the danger than he hastened to the north, as he had done on the occasion of the former out-

break; and by his presence and the influence which he possessed in his own district, he did much to counteract the proceedings of the rebels. Lovat made an attack on Culloden House, from which he was beaten off with great spirit by the president and his people. When the rebellion spread he was compelled to take refuge in Skye; and on his return after Culloden, instead of reaping the fruits of his services, he was regarded with jealousy and aversion by the government. Even the large sums of money he had advanced were never repaid him. The ingratitude of the government and the disasters brought on the country by the rebellion shortened his days; but he discharged his judicial duties till within a month of his death, 10th December 1747. See Hill Burton's *Lives of Lord Lovat and Duncan Forbes of Culloden* (1847).

**Forbes, EDWARD**, naturalist, was the son of a banker, and was born at Douglas, Isle of Man, February 12, 1815. He received a desultory and imperfect education in early life in consequence of ill-health. In 1831 he went to London with the intention of becoming a student at the Royal Academy, but later in the same year entered the university of Edinburgh as a student of medicine; and in 1836 he finally relinquished his medical studies to devote himself exclusively to the natural sciences. In 1836-37 he studied at Paris under Geoffroy St-Hilaire, Jussieu, and De Blainville. From the first year of his college life Forbes had spent his summer vacations in rambles over various parts of Great Britain or in excursions on the Continent, publishing the results of the observations which he made either as separate works or in the pages of scientific journals. In 1841 he joined the surveying ship *Beacon* as naturalist, and accompanied that vessel during the survey of a part of Asia Minor. On his return to England in 1843 he became professor of Botany in King's College, London, and curator of the Geological Society. In 1844 he was appointed palaeontologist to the Museum of Geology in connection with the Ordnance Geological Survey; in 1851 professor of Natural History in the School of Mines; in 1852 president of the Geological Society; and in 1853, on the death of Professor Jameson, he was elected to the vacant chair of Natural History in the university of Edinburgh. In the summer of 1854 he delivered a short course of lectures—the only one he was destined to give—for at the commencement of the winter session he was seized with a severe illness, which speedily proved fatal; and he died on the 18th November 1854, in the thirty-ninth year of his age, and in the very zenith of his fame. Forbes had been a voluminous writer and a diligent observer of nature from his earliest youth, and had collected an immense mass of materials, many of which were, however, left at his death in a state of disorder. He did much to advance and systematise special departments of natural history, both by his own labours and by the stimulus which he imparted to his associates and pupils. His classification of the British star-fishes opened a new era in that branch of zoology; and his discovery that air-breathing molluscs lived at the period of the Purbeck beds rectified many erroneous hypotheses. From an early period he had directed his attention to the distribution of animal and vegetable life in different zones of the sea and land, and his observations in this path of inquiry have opened many new fields of research. Of his separate works, papers, and monographs upwards of two hundred were published, many of them copiously illustrated by his own beautiful drawings. Among them may be instanced the following: *On the Distrib. of Pulmonif. Mollusca in Europe* (1838), *Malacol. Monensis* (1838), *Star-fishes* (1841), *The Radiata and Mollusca of the Aegean* (1843), *Travels*

in *Lycia* (in conjunction with Spratt, 1846), *Naked-eyed Medusæ* (1847), *British Mollusca* (conjointly with Hanley, 4 vols. 8vo, 1853), and *Collection of Literary Papers by E. Forbes* (1855). See the Memoir by G. Wilson and A. Geikie (1861).—His brother DAVID (1828-76) was distinguished as a geologist.

**Forbes, JAMES DAVID**, physicist, was the son of Sir William Forbes of Pittligo, and grandson of the Sir William Forbes given below. Born at Edinburgh, April 20, 1809, he studied in the university there from 1825 until 1830, when he was called to the Scottish bar. But the physical sciences were from an early age serious rivals to the law in his affections. From 1833 he held the chair of Natural Philosophy in Edinburgh University, exchanging it in 1859 for the principalship of the United College in the university of St Andrews. Among his contributions to science are his investigations on the polarisation of radiant heat by the tourmaline, and also by reflection, and its circular polarisation (1834)—discoveries forming some of the strongest proofs of the identity of calorific and luminous rays; the unequal polarisation of heat from different sources (1844); the conductivity of heat by iron; the refrangibility of heat; the depolarisation of heat; underground temperatures, &c. He is, however, best known by his researches on the motion of glaciers, in connection with which subject he wrote *Travels through the Alps* (1843), *Norway and its Glaciers* (1853), *Tour of Mont Blanc and Monte Rosa* (1855), and *Occasional Papers on the Theory of Glaciers* (1859). He was the first to establish the great fact that glacier ice moves in its channel like a viscous fluid, the middle moving faster than the sides, and the upper portions faster than the lower. In meteorology Forbes, among other things, improved Wollaston's application of the thermometer to the determination of heights, and verified Fourier's theoretical results concerning the temperature of the ground at different depths and in different kinds of soil and rock. He also contributed numerous papers on astronomy and other subjects to the *Transactions* of the Royal Societies of London and Edinburgh, to the *Edinburgh Philosophical Journal*, and similar periodicals. He died December 31, 1868. See his *Life and Letters*, edited by Shairp, Taft, and Adams Reilly (1873).

**Forbes, SIR JOHN**, physician, was born about the close of 1787, at Cuthlebræ, Banffshire. After studying at Aberdeen and Edinburgh he entered the navy in 1807 as assistant-surgeon; in 1817 he took the degree of M.D. at Edinburgh; and after practising as a physician at Penzance and at Chichester he went in 1840 to London, where he speedily made a large practice. He was knighted in 1833 by the Queen, to whose household he held the appointment of physician in ordinary. He was F.R.S. and D.C.L. of Oxford, as well as member of numerous foreign societies. Conjointly with Drs Tweedie and Conolly he was the editor of the *Cyclopædia of Practical Medicine* (4 vols. 1832-35). In 1836 he founded the *British and Foreign Medical Review*, which he carried on for twelve years. To him in a great measure belongs the merit of having introduced the use of the stethoscope in England, and of having successfully directed the attention of British practitioners to the art and practice of physical diagnosis. He died 13th November 1861.

**Forbes, SIR WILLIAM**, of Pittligo, an eminent Scottish banker, son of Sir William Forbes, Bart., advocate, was born in Edinburgh, April 5, 1739. In his fifteenth year he entered the bank at Edinburgh of Messrs John Cantus & Co., and in 1761 was admitted a partner; and in 1763 a new company was formed of which Sir William Forbes

ultimately became the head. In 1781 he purchased the estate of Pittligo, Aberdeenshire, which had been forfeited by Lord Forbes of Pittligo for taking part in the rebellion of 1745. He published a *Life of his friend Beattie*, the poet, in 1805; also *Memoirs of a Banking House*, being the history of his own (1803; ed. by Robert Chambers, 1860). He died November 12, 1808. His bank became in 1830 the Union Bank of Scotland. One of his sons was John Hay Forbes, Lord Medwyn.

**Forbes-Mackenzie, WILLIAM** (1801-62), M.P. for Peeblesshire, whose name is known in connection with an Act introduced by him and passed in 1853 'for the better regulation of public-houses in Scotland,' prohibiting provision-merchants from selling excisable liquors 'to be drunk on the premises,' permitting public-houses to be open on week-days only between 8 A.M. and 11 P.M., and forbidding the sale of liquor in hotels throughout the Sundays save to lodgers and *bona-fide* travellers. See LICENSING LAWS.

**Forbidden Fruit**, or ADAM'S APPLE, a name fancifully given to the fruit of different species of Citrus, especially to *C. Medica*, var. *paradisi*, which has indentations in its rind suggesting tooth-marks. In Ceylon the same name is applied to the fruit of *Tubercanmontana dichotoma* (Apocynaceæ). The shape of the fruit suggests the idea of a piece having been bitten off, and the legend runs that it was good before Eve ate of it, although it has been poisonous ever since.

**Force**. As employed in physical science, the term *force* means any cause which changes the direction or speed of the motion of a portion of matter. It is therefore correctly applied to a push or pull, to the weight of a body, the attraction exerted by a magnet on a piece of iron or by an electrified body on a pith-ball, &c. This is expressly laid down in the first of Newton's Laws of Motion—to wit:

*Every body perseveres in its state of rest, or of uniform motion in a straight line, except in so far as it is compelled by forces to change that state.*

Now, we find that we can, by conscious muscular exertion, set a piece of matter in motion, and also change its motion both in speed and in direction. Hence we figure to ourselves that we are exerting force upon it. But here great caution is requisite, as the direct impressions of sense are, in many cases, notoriously misleading. Until we know what Matter (q.v.) is, it is practically useless to speculate as to the precise nature of force, if indeed there be such a thing at all. Even Newton's language has an anthropomorphic character which it would be difficult to avoid without coining words for the purpose. Of course in Newton's system the force is assigned in direction and magnitude by the change of motion (i.e. of Momentum, q.v.) said to be produced by it in a given time. This is the essence of the second law of motion.

And the third law greatly extends our view of the subject, for it points out that force is always dual:

*To every action there is always an equal and contrary reaction, or the mutual actions between two bodies are always equal and oppositely directed.*

But, as the results of the action and reaction alike are mere changes of momentum, and as neither can present itself without the other, all that we are logically entitled to say is that no change of motion takes place unaccompanied by an equal and opposite change. The introduction of the action and reaction may thus be merely an attempt to explain this observed interchange of momentum by the help of the sense-suggested notion of force.

There is no doubt that the introduction of the idea of force has been very useful, if only in

enabling us to express the fundamental laws of dynamics in a particularly concise and easily intelligible form. But there is equally little doubt that everything yet known on the subject can be perfectly well expressed without the use of the term force, or of the idea which it embodies.

The dynamical expression for which the term force has been introduced as a substitute presents itself in two forms, different in name and conception, but intrinsically the same—viz. the time-rate at which momentum (see *MOTION, LAWS OF*) changes, or the space-rate at which Energy (q.v.) is transformed or transferred. Thus, when a stone is let fall, the momentum which it acquires is proportional to the time of falling, so that after  $t$  seconds its amount is, say,  $At$ ; and in falling through a space of  $h$  feet it loses in potential energy, while it gains in kinetic energy, an amount proportional to the height fallen through, say,  $Bh$ . Experimental measurement shows us that  $A$  and  $B$  are one and the same quantity, and we say it represents the weight of the stone—i.e. the force under which we figure to ourselves that the fall takes place. It is very convenient to do so. But, except the indications of our muscular sense, we have no proof whatever that there is any reason for the fall of the stone other than the observed fact that energy has the property of preferring the kinetic to the potential form. And the statement that a stone of given mass has potential energy to a given amount, depending directly on its elevation above the earth, is sufficient (without even mention of weight, or of force in any form) to enable us to calculate all the circumstances of its fall. Though we have confined ourselves to an exceedingly simple example, a similar but of course more general statement as to energy enables us to make the calculation requisite for determining the motion in all cases, however complex.

Newton's definition of force has sometimes been amended (?) into 'Any cause which changes, or tends to change, the motion of a body.' But this is entirely foreign to his system. For his second law expressly says, '*Change of momentum is proportional to force, and takes place in the direction of the force.*' Hence, from Newton's point of view, there is no balancing of forces, though there may be balancing of the effects of forces.

The *Resultant* of two forces which act on the same particle of matter is defined as the single force which could produce in that particle the same change of momentum as would the two given forces if they acted jointly on it for the same period of time. As it follows at once from Newton's second law that different forces, acting for equal times on the same particle, produce velocities in their own directions and proportional to their magnitudes, the question of compounding these forces is the same as that of compounding the corresponding velocities. Hence we have at once the only correct basis for the proof of that *Parallelogram of Forces*, or *Triangle of Forces*, on which (from the so-called *statical* point of view) as much absolutely useless thought has been expended as upon Euclid's celebrated twelfth axiom and its consequences.

The true measure of a force is, of course, the amount of momentum which it produces in a given time. Hence, if our fundamental units of mass, length, and time be the pound, foot, and second, unit force is that which gives in one second a speed of one foot per second to a mass of one pound. This is the British absolute unit of force. As gravity produces a speed of about 32 feet per second during each second of the motion of a falling body, the unit force is (speaking very roughly) about  $\frac{1}{32}$  part of the weight of a pound—i.e. about the weight of half an ounce. If we adopt the so-called C.G.S. system, in which the

units are the centimetre, gramme, and second, the unit force (called a *dyne*) is that which in one second produces a speed of one centimetre per second in a mass of one gramme. Compared with the British absolute unit, the dyne is very small, being little more than  $\frac{1}{32000}$ th part of it.

But the most startling of all the reflections on force and its ultimate nature which have perhaps ever been made are those of Faraday. Without calling in question in ordinary cases the truth of the conservation of energy, he has endeavoured, by experiment (the only genuine test in a question so novel and so profound), to prove what may be called the Conservation of Force. Here we understand *force itself*, and not *energy*. He argues thus: Two masses, according to the undisputed law of gravitation, attract with four times their mutual force if their distance be diminished to half, and with only one-fourth of the same if their distance be doubled. He asks *whence comes the additional force in the former, and what becomes of the lost force in the latter case?*

Now, it is evident that this is a new question, totally distinct from any we have yet considered. To answer it, we must know *what* force is. Would gravitation have any existence if there were but one particle of matter in the universe, or does it suddenly come into existence when a second particle appears? Is it an attribute of matter, or is it due to something between the particles of matter? Faraday has tried several experiments of an exceedingly delicate kind, in order to get at some answer to his question. A slight sketch of one of them must suffice. A pound-weight is not so heavy at the ceiling of a room as it is when on the floor; for, in the former case, it is more distant from the mass of the earth than in the latter. The difference for a height of 30 feet is (roughly) about  $\frac{1}{100000}$ th of its weight. Now, if a mass of metal be dropped through such a space, an additional force,  $\frac{1}{100000}$ th of its weight, is called into play; and the object of the experiment was to detect whether electrical effects accompanied this apparent *creation* of force. The mass, therefore, was a long copper wire, whose coils were insulated (see *ELECTRICITY*) from each other, and whose extremities were connected with those of the coil of a delicate Galvanometer (q.v.). Had any trace of an electric current been produced, the needle of the galvanometer would have been deflected; but, when all disturbing causes were avoided, no such deflection was detected. Other experiments with a view to the detection of other physical energies were also tried, but, like the first, with negative results only.

From what has been said above it is clear that we must not hastily conclude that there is such a *thing* as force, though we are in the constant habit of speaking about it. Our sensations are all more or less misleading until we can interpret them. The pain produced by a blow is quite a different thing from the energy of motion of a cudgel; and, when our muscular sense impresses on us the idea that we are exerting force, we must be cautious in our conclusions. For it is certain that force is *merely the rate per unit of length at which energy is transferred or transformed*.

**Force and Fear** are used as technical terms in the law of Scotland to denote that amount of constraint or compulsion which is enough to annul an engagement or obligation entered into under its influence. As consent is the essence of contracts, contracts entered into under compulsion are, in law, void from the first, as if they had never been entered into. But it is not every degree of constraint which will have this effect in law. As Bell states it (*Principles*, 12), the force and fear must be 'not vain or foolish fear, but such as to overpower a mind of ordinary firmness, or such as,

applied to a person of weaker age, sex, or condition, will produce the effect of overpowering violence on a firmer mind. Among the instruments of force and fear which have been held to annul engagement are threats and terror of death; pain to one's self, or one's parent or child; infamy and disgrace; imprisonment, when employed to obtain an advantage beyond the lawful object of it; and even loss of property.' On proof of force and fear the law restores the parties to the contract to the position in which they were before it was entered into, and will find the party employing it liable in damages as reparation for any injury done to the party constrained. The corresponding term in English law is *Duress* (q.v.). This is by imprisonment or by threats. The kind of threats held to constitute duress are threats of imprisonment, or of loss of life or limb, or threats of *mayhem*—i.e. of the deprivation of a member proper for defence in fight, as an arm, a finger, an eye, or a fore-tooth (but not a jaw-tooth, or an ear, or a nose, because these are supposed to be of no use in fighting). The maxim of the common law with regard to duress is that 'what otherwise is good and just, if sought by force or fraud, becomes bad and unjust.'

**Forcellini**, EGIDIO, Italian lexicographer. See FACCIOLATI.

**Forceps** (Lat., 'a pair of tongs or pincers'), the name given by surgeons to an instrument of great antiquity, used as a substitute for the fingers, and consisting of two levers of metal jointed together crosswise, nearer to one end than the other. The hand grasping the longer ends of the levers or handles closes the shorter ends, which are shaped so as to seize firmly the intended object. There is scarcely a surgical operation in which some form of forceps is not applied; and very numerous different shapes and sizes are made for different purposes. In addition to the forms used for the extraction of teeth (see DENTISTRY) there are, e.g., the *dissecting* forceps, which have roughened points, to lay hold of small portions of tissue which are to be divided by the knife; the *lithotomy* forceps, which have blades concave like spoons; and *fenestrated* forceps, which have apertures in the blades, and, as the soft tissues project into these, obtain a firm hold with less risk of tearing the parts. By means of Liston's *cutting* forceps a powerful hand can divide a great thickness of bone. But the most important of all are the *midwifery* forceps, an invaluable invention in cases of difficult delivery, which daily rescues from suffering and danger numerous mothers and infants. It was invented in the 17th century, probably by Paul Chamberlen, who, however, with his son and grandson, kept their method of facilitating delivery as a profitable family secret; and it did not become generally known to the medical profession till the first half of the 18th century. Numerous modifications of the instrument have since been introduced, but its main principle remains unchanged. It consists of two concave fenestrated blades, forming a cavity into which the head of the child fits. The blades are applied separately, one to each side of the head, and then locked together. Holding by the handles, the accoucheur aids the natural efforts of labour. The instrument does not necessarily or generally injure either mother or child.

**Forcible Entry**. According to English law any person who enters on property, in order to take possession of it, with violence or intimidation is guilty of a misdemeanour. It is immaterial whether the person so entering has a right to the property or not. If a person wrongfully in possession detains property by violence or threats he is guilty of the offence known as forcible detainer.

**Forcing**, in Gardening, is a term used to designate a process in which artificial heat is applied so that flowers, fruits, or other products of plants are obtained at a date or season other than that at which they may be had in the ordinary course of culture. Thus, for example, kinds of grapes which by the simple influence of the heat of the sun in a vinery do not ripen till September or October are induced by forcing to ripen in March or later, according to the period the process is commenced; and strawberries, which ripen in the open air in Britain variously from June to September, in the forcing-house yield their fruit from February onwards. Conducted, as the system is, during the short days of the year, the chief obstacle the gardener has to contend with is diminished light. This in the case of forcing fruits taxes his skill to the utmost, because abundant light is essential both to the proper fertilising of the flowers and to the perfecting of the fruit. Some vegetables and salads and many flowers are, however, more successfully forced in the dark than in light. Rhubarb, sea-kale, mushrooms, lily of the valley, lilac, are all forced in greater or less darkness in order the better to develop their individual perfections. The remarkable purity of the colour of the flowers of the last two, as seen in the shops in December and January, is due to this circumstance; and the result will appear the more striking to the uninitiated when it is stated that a purple variety of lilac is preferred to a white one for forcing, because it not only comes out of the process a purer white, but with greater substance than the latter. Forcing in its application to various plants—especially flowering plants—has greatly extended during the last twenty years, and is still extending. It may be regarded as the greatest triumph of horticultural art, because it renders possible the enjoyment of nature's summer bounties in all their freshness, lusciousness, and beauty in winter. See GARDENING.

**Ford**, JOHN, dramatist, was the second son of Thomas Ford of Hsington, Devonshire. He was baptised at Hsington, 17th April 1588. After studying for a short time at Exeter College, Oxford, he became in November 1602 a member of the Middle Temple. His first work was an elegy on the death of the Earl of Devonshire, entitled *Jane's Memorial* (1606), with a dedicatory sonnet to Penelope, Countess of Devonshire (the 'Stella' of Sidney's sonnets); and in the same year he published *Honour Triumphant*; or *the Peers' Challenge*. . . . Also *the Monarch's Meeting*; or *the King of Denmark's Welcome into England*. He was writing for the stage as early as 1613, when his unpublished comedy, *An Ill Beginning has a Good End*, was acted at the Cockpit; but the first of his published plays is *The Lover's Melancholy*, produced 24th November 1623 and printed in 1620, a comedy of no particular merit. His most powerful tragedy, *'Tis pity She's a Whore*, acted at the Phoenix in Drury Lane, was published in 1633, with a dedicatory epistle to John, first Earl of Peterborough. To the same year belongs *The Broken Heart*, dedicated to Lord Craven. The closing scenes, deeply impressive but strangely fantastic, were passionately admired by Charles Lamb. *Love's Sacrifice* (1633), dedicated to the author's cousin, John Ford of Gray's Inn, is in parts excellent, but disappointing as a whole. Far more satisfactory is *The Chronicle History of Perkin Warbeck* (1634), dedicated to the Earl (afterwards Duke) of Newcastle. *The Fancies Chaste and Noble* (1638), dedicated to the Earl of Antrim, has an interesting but badly handled plot. *The Lady's Trial* (1638), had it been equal at all points, would have been a good play; it fails in the last act. *The Sun's Darling*, licensed for the stage in March 1623-24 and posthumously published in 1656, was

written in company with Dekker, who probably supplied the pleasing lyrical passages. Two other plays by Dekker and Ford, *The Fairy Knight* and *The Bristowe (Bristol) Merchant*, were produced in 1624, but were not published. *The Witch of Edmonton*, produced circa 1621 and published in 1658, was written with Dekker and William Rowley. Ford's share was probably confined to the scenes which relate to Frank Thorney. On one occasion Ford collaborated with Webster; but the tragedy, *A late Murder of the Son upon the Mother*, licensed for the stage in September 1624, was not given to the press. To Webster's *Duchess of Malfi* (1623) Ford prefixed a copy of commendatory verses. Among the plays unfortunately destroyed by Bishop Warburton's cook were four pieces by Ford, a tragedy, and three comedies. The tragedy, *Beauty in a Trance*, was entered in the Stationers' Register in 1653, and the three comedies, *The London Merchant*, *The Royal Combat*, and *An Ill Beginning has a Good End*, were entered in 1680; but all four remained unpublished.

After the publication (1639) of *The Lady's Trial* Ford passes from notice. There is a tradition that he secured a competence by his professional labours, and ended his days in Devonshire. It is certain that he was not dependent on the stage for his livelihood. In procuring practice he was doubtless aided by the influence of his maternal uncle, Lord Chief-justice Popham. Ford had little comic talent, but his place among the tragic poets is unassailable. There is often a want of spontaneity in his writings; he is too elaborate and too subtle; but his two great tragedies, *'Tis Pity* and *The Broken Heart*, are not far inferior to Webster's masterpieces. William Gifford edited Ford's works in 1827; another edition by Hartley Coleridge appeared in 1840; and in 1889 Alexander Dyce issued a revised edition of Gifford's *Ford*.

**Ford, RICHARD, F.S.A.**, was born in 1796, graduated at Oxford in 1817, and was called to the bar, though he never practised. The years 1830-34 were spent in a series of long riding tours in Spain; and in 1845 appeared the first edition of his delightful *Handbook for Travellers in Spain*. His *Gatherings from Spain* (1846) is mainly made up of charming matter which want of space caused to be cut out of the second edition of the *Handbook*. For twenty years Ford was a contributor to the *Quarterly* and other reviews, and his papers on Spanish art especially are of great value. He died 1st September 1858.

**Fordun, JOHN OF.** This early Scottish chronicler was a secular priest, and a canon of the cathedral church of Aberdeen. It has been inferred from his name that he was born at Fordun, in Kincardineshire. Having proposed to himself the compilation of a chronicle of Scotland, he is said to have travelled on foot through Britain and Ireland in search of materials. He lived to write only five books of his *Scotichronicon*, bringing the history down to the death of King David I. in 1153. He left collections extending to the year 1385, about which time he is supposed to have died. The work which John of Fordun had left unfinished was resumed in 1441 by Walter Bower, abbot of the monastery of Austin Canons Regular, at Inchcolm, in the Firth of Forth. Making use of his collections so far as they went, Bower enlarged the five books which Fordun had completed, and wrote eleven new books, bringing the *Scotichronicon* down to the year 1437; but many of his alterations corrupted Fordun's narrative. The work is the chief authority for the history of Scotland prior to the 15th century; its value being greatest during the 14th, when it is contemporary. Of the *Scotichronicon* there exist upwards of twenty MSS.,

the purest as regards Fordun's text being that preserved in the Wolfenbützel library. Four printed editions have been published. The latest edition of Fordun's own work is that chiefly from the Wolfenbützel MSS. edited by W. F. Skene (2 vols. Edin 1871-72); one of the volumes being an English translation of the Latin text.

**Forecasts.** See METEOROLOGY.

**Foreclosure**, in English law, the process by which a mortgagor failing to repay the money lent on the security of an estate is compelled to forfeit his right to redeem the estate. Every person having mortgaged his estate is entitled to an equity of redemption, which can only be cut off by a formal process. For this purpose the mortgagee files a bill of foreclosure, praying that an account may be taken of the principal and interest due under the mortgage, and that the mortgagor, on failing to pay, may forfeit his equity of redemption. If on the day fixed for payment the money be not forthcoming, the mortgagor will be declared to have forfeited his equity of redemption, and the mortgagee will be allowed to retain the estate. See MORTGAGE.

**Foreign Enlistment Act.** In the law of England there was a statutory prohibition of enlistment in the service of a foreign prince from the times of James I.; but the statute commonly known as the Foreign Enlistment Act is that of 1870. It provides that if any British subject shall agree to enter the service of any foreign state at war with any friendly state, either as a soldier or a sailor, without the license of Her Majesty, or an order in council or royal proclamation, or if any person within the British dominions induces any other person to enlist in the service of a foreign state, such person shall be guilty of a misdemeanour. The officers of the customs, on information on oath, may detain any vessel having persons on board destined for unlicensed foreign service. Masters of vessels knowingly having such persons on board are punishable by fine or imprisonment or both. Persons building any vessel for foreign service without license are guilty of a high misdemeanour, and the ship and stores are forfeited. Even to assist a foreign state at war with a friendly state by supplying warlike stores without license is a misdemeanour punishable with fine and imprisonment. These penalties are irrespective of any consequences that may follow to the individual for having committed a breach of international law. See MERCENARIES.

**Foreigner.** See ALIEN.

**Foreign Law.** The term foreign is applied by lawyers to places and matters outside the limits within which certain laws apply and courts have jurisdiction. Thus, to an English lawyer Scotland is a foreign country. Foreign law as such has, of course, no application to England; but the comity of nations requires that it should be recognised and acted upon in certain cases, as, for example, by the Extradition (q.v.) of offenders. The judgment of a foreign court, if in favour of the defendant, is an answer to an action brought on the same complaint in England; if in favour of the plaintiff, it is accepted as *prima facie* evidence that his claim is well founded, and he may obtain satisfaction by suing on the judgment in England. Foreign law is proved in an English court as a matter of fact by the evidence of experts, or, if necessary, by taking the opinion of a foreign court. Government is empowered to make treaties for facilitating mutual ascertainment of laws. The courts will not act on a judgment which seems to have been improperly obtained, nor will they enforce a foreign law which is not in

accordance with natural justice as we understand it. The foregoing rules are not peculiar to England; they are followed by the courts of other countries. The French courts, for example, give effect to English judgments. A creditor in Britain suing a debtor who is abroad may usually obtain leave to cite or serve him with process in his absence; in England leave is also given to serve process out of the jurisdiction; as to Scotland, see **EDICTAL CITATION**. The judgment obtained in the debtor's absence may be enforced by a foreign court. Foreigners resident but not domiciled in a country may usually sue one another in the ordinary courts; but the French courts have refused to entertain such suits, except in commercial matters.

The Foreign Jurisdiction Acts regulate the proceedings of criminal courts in places (such as Turkey, for example) where the local government is bound by treaty or capitulation to permit British magistrates to act. The Foreign Enlistment Act is a separate article (q.v.). In London and some other cities there is a custom called Foreign Attachment. When a defendant fails to appear to an action his property within the local jurisdiction (e.g. debts due to him) may be attached in order to compel his appearance or to obtain satisfaction of claims against him; see **ATTACHMENT**.

**Foreign Money.** See **TENDER**.

**Foreign Office.** See **SECRETARY OF STATE**.

**Foreland, NORTH and SOUTH**, two promontories of England, on the east coast of Kent, between which are the Downs and Goodwin Sands. North Foreland, the *Cantium* of Ptolemy, which forms the north-east angle of the county in 51° 22' N. lat. and 1° 26' E. long., consists of chalky cliffs, nearly 200 feet high. It has a lighthouse 85 feet high, with a fixed light, 188 feet above the sea, and seen 20 miles off. South Foreland, also composed of chalk-cliffs, is 16 miles S. of North Foreland, in 51° 8' N. lat. and 1° 22' E. long. It has two fixed lights, respectively 380 and 275 feet above the sea, and seen from a distance of 25 and 22 miles. It was off this part of the coast that the four days' sea-fight between Monk and De Ruyter took place in 1666.

**Forensic Medicine**, another term for **Medical Jurisprudence** (q.v.).

**Foreshore.** See **SEASHORE**.

**Foreshortening**, a term in **Painting** or **Drawing**, applied to signify that a figure, or a portion of a figure, which is intended to be viewed by the spectator directly or nearly in front, is so represented as to convey the notion of its being projected forward; and, though by mere comparative measurement occupying a much smaller space on the surface, yet to give the same idea of length or size as if it had been projected laterally.

**Forestalling.** See **ENGROSSING**.

**Foresters, ANCIENT ORDER OF.** See **FRIENDLY SOCIETIES**.

**Forest-fly**, or **HORSE-FLY** (*Hippobosca equina*),

Forest-fly (*Hippobosca equina*), magnified:  
a, natural size; b, the pupa, as deposited by the mother.

a Dipterous insect, parasitic on horses, oxen, &c.,

frequent in forests, particularly in the New Forest, Hampshire. It is a small insect, about four lines long, of a shining brown colour, with some yellow. Living on the blood of its host, it especially infests the tail, belly, and flanks. The insect passes the larval stage and becomes a pupa within the mother. One only is produced at a time, enclosed in a relatively large, black, head-like, tough cocoon, from which the insect finally emerges by bursting open a kind of lid.

**Forest Laws.** Forest is defined by Coke to be a safe preserve for wild animals (*feræ*) of the chase. A forest, in the sense of the law of England, is a large tract of open ground, not necessarily covered with wood, but usually containing woodland interspersed with pasture, and forming part of the property of the monarch, and governed by a special code, called the forest law. This particular law not only had reference to matters connected with hunting and the like, but generally governed the persons living within the forest in all their relations. Though the privilege of forest belongs of right to the sovereign alone, it may be granted by him in favour of a subject, who becomes entitled to exercise the privileges of forest in the district assigned. This right was exercised by the Saxon kings, who reserved large tracts of country for hunting. William the Conqueror greatly extended the royal forests, by laying desert vast districts in Hampshire and Yorkshire; he also introduced penalties of the severest kind for offences against the game. But the laws of the forest were first reduced to a regular code by the Forest Charter of 1217. The right of the sovereign to create a forest is by the common law confined to lands of his own demesne. Henry II. had arbitrarily exercised his power by afforesting the lands of his subjects; but by this charter of Henry III. it was provided that all forests so made should be disafforested. By the same charter the penalties for destroying game were greatly modified, it being provided that no man should lose life or limb for slaying deer, but that the punishment should be restricted to fine or imprisonment for a year and a day. Chap. 11 contains the following curious privilege: 'Whatsoever archbishop, bishop, earl, or baron, coming to us at our commandment, passing by our forest, it shall be lawful for him to take and kill one or two of our deer by view of our forester if he be present; or else he shall cause one to blow an horn for him, that he seem not to steal our deer; and likewise they shall do returning from us.' Charles I.'s attempts to impose penalties and exact fines for alleged encroachments on the ancient boundaries of the forests, though the right to the lands thus taken was fortified by possession for several centuries, were among the first grievances with which the Long Parliament dealt. Since the passing of the Act for the 'certainty of forests' (16 Car. I. chap. 16), the laws of the forest have practically ceased. In Coke's time there were sixty-nine royal forests; of these the principal were the New Forest, Sherwood, Dean, Windsor, Epping, Dartmoor, Wyche in Oxfordshire; Salecy, Whittlebury, and Rockingham in Northamptonshire; Waltham in Lincolnshire; and Richmond in Yorkshire. Some of these, however, including Whittlebury and Wyche, have been disafforested since 1850. The royal forests of Scotland in ancient times seem to have been nearly as numerous as those of England. In Perthshire there were the forests of Athole, Glenartney, Glenlulas, Glenalmond, Birnam, Cluny, Alyth, &c.; in Forfarshire, Platan, Montboulmont, Kilgorry; in Kincardineshire, Cowie and Dunris; in Aberdeenshire, the Stockel, Dyce, Kintore, Benachie, Drum, Birse, Braemar; in Banffshire, the Boyne and the

Enzie; in Elgin, Darnaway, &c. South of the Forth were those of Torwood, Cadzow, Ettrick, Selkirk, Jedburgh, Traquair, the New Forest in Dumfriesshire, &c. The forest code of Scotland (*Leges Forestarum*), though neither so complete nor administered with the same rigour as that of England, was still generally complained of for its severe penalties and vexatious restraints. The grant of a right of forestry conferred the same privilege as if the ground over which it extended had been originally, and had continued to be, a king's forest. See DEER-FORESTS, GAME LAWS, WOODS AND FORESTS; and for other information about forests, ARBORICULTURE, METEOROLOGY, FOSSILS; also the articles on DEAN, EPPING, SHERWOOD, NEW FOREST, &c.

*Forest Courts* were established for the purpose of enforcing the laws relating to the royal forests. Of these there were in England four—viz. the Court of Attachments, of Regard, of Swainmote, and of the Lord Justice in Pyre in the Forest, or Justice Seat. The last Court of Justice Seat at which business was transacted was held in the reign of Charles I. before Lord Holland; the office of itinerant forest justices was not abolished until 1817, the criminal law of the forest having been almost wholly repealed half a century before.

**Forest Marble**, a member of the middle division of the Jurassic System (q.v.), so called because of the occurrence of the typical beds in Wychwood Forest, Oxfordshire. The principal bed is a fissile limestone, containing large numbers of dark-coloured shells (chiefly *Ostrea* and *Pecten*), and capable of sustaining a fine polish. On this account it is used to some extent as 'marble.' It is interstratified with beds of clay and shale, occasional marls, and sandstones. The thickness of the group in North Dorsetshire is 450 feet, but it thins away northwards, being about 100 feet near Bath and Cirencester.

**Forest Oak**, a name sometimes given in commerce to the prettily marked timber of *Cusuarina torulosa* of Queensland.

**Forfar**, the county town of Forfarshire, 14 miles NNE. of Dundee, stands at the east end of Forfar Loch, on a rising ground in the fertile valley of Strathmore. It was a royal residence as early as the reign of Malcolm Canmore, whose son, David I. (1124-53), made it a royal burgh; but in 1308 Bruce captured and razed the castle—its site is marked now by the town cross of 1684. Forfar, says Boece, was 'brought in 1526 to little more than a country village;' but since the middle of the 18th century it has risen again to a comfortable town, with several good public buildings, among them a striking Episcopal church (1831). The making of brogues by the 'Forfarouters' is a thing of the long past; and linen is now the leading manufacture. With Montrose and three other burghs it returns one member to parliament. Pop. (1841) 8362; (1891) 12,844. Glamis Castle, a stately château-like pile, the seat of the Earl of Strathmore, lies 5 miles WSW.

**Forfarshire**, or **ANGUS**, a maritime Scottish county, washed on the east by the German Ocean, on the south by the Firth of Tay. It has an utmost length and breadth of 36 and 36½ miles, and an area of 890 sq. m. The surface is finely diversified, the rich plain of Strathmore—the Howe of Angus—dividing the Sidlaw Hills (1399 feet) from the Grampian Braes of Angus in the north-west, which culminate in Cairn na Glasha (3484 feet) on the Aberdeenshire boundary, and exceed 2000 feet in twenty-two other summits. The chief streams are the North and South Esks and the Isla; and Loch Lee (9 by 2 furlongs) is the largest of several small lakes. The rocks are Silurian in the north-west,

and elsewhere Old Red Sandstone; the soils are very various. Somewhat less than half of the entire area is in cultivation, and more than one-nineteenth under wood. Agriculture is practised on the best methods, and much attention is paid to live-stock, though the celebrated 'polled Angus' belongs now specially to Aberdeenshire (see CATTLE). Linen and jute are the staple manufactures of the towns. These include Dundee, Montrose, Arbroath, Brechin, Forfar, Broughty-Ferry, Kirriemuir, and Carnoustie. The county returns one member to parliament. Pop. (1801) 99,053; (1831) 266,360; (1891) 277,789. Part of Southern Pictavia, then till 1242 the *normaer*-ship or old Celtic earldom of Angus, Forfarshire is rich in antiquities—vitrified and other hill-forts, cairns and standing-stones, Roman camps, the sculptured stones of Meigle, Aberlemno, St Vigeans, Glamis, &c., the ruins of Restennoth priory and Arbroath abbey, the round tower and cathedral of Brechin, and the old castles of Glamis, Edzell, Finhaven, Airlie, &c. See A. Jervise's *Memorials of Angus and Mearns* (1861), and *Land of the Lindsays* (2d ed. 1882); and Warden's *Angus or Forfarshire* (4 vols. 1880-83).

**Forfeiture** is a legal term which includes the various cases in which a person is penally deprived of property. An offender who is fined forfeits a sum of money, which is recovered out of his general estate. The feudal law of England made forfeiture of land and goods part of the punishment of an offence involving disloyalty or breach of feudal duty; thus, the lord might claim lands in case of what was called 'escheat with attainder,' and there was forfeiture to the king in case of treason. An act of 1870 abolishes forfeiture in case of conviction for treason and felony; but the crown may appoint a person to administer the property of a convict; compensation to parties injured, and the costs of the prosecution, may be paid out of his estate. Civil forfeiture of land may still be incurred by unlawful alienation in Mortmain (q.v.), or by breach of the conditions on which the property has been acquired. A tenant, for example, may incur forfeiture by breach of his covenants, or by wrongful disclaimer—i.e. setting up a claim adverse to that of his landlord. Forfeiture for tortious alienation (i.e. for attempting to convey an estate greater than the grantor is entitled to) is now obsolete. The courts will always lean against a forfeiture, and the Conveyancing Act, 1881, protects a tenant against this extreme penalty where compensation in money meets the justice of the case.

In Scotland civil forfeiture may arise either from statutory enactment, at common law, or by agreement. By 1597, chap. 246, it is enacted that vassals failing to pay their feu-duties for two years shall forfeit their right. This forfeiture must be established by an action to recover the feu-duties in arrear, and may be avoided by payment at the bar. At common law a vassal forfeited his land by disclamation or purpresture. The former is analogous to the English disclaimer, and consists in the denial by a vassal of his lawful superior. Purpresture was incurred by the vassal's encroachment on the streets, highways, or commonities belonging to the crown or other superior. These forms of forfeiture are fallen into disuse. Forfeiture on special agreement depends wholly upon the terms of the condition inserted in the titles to the land. The condition must be fortified by irritant and resolute clauses, and must enter the sasine, in order that it may be effectual against purchasers of the lands. Of this kind of forfeiture are breaches of Entails (q.v.). See **ATTAINDER**, **TREASON**.

**Forgery** (*fr. forger*, 'to form metal into shape,' 'to fabricate')—the *crimen falsi* of Roman law, in

which it was punished with banishment or death, according to the enormity of the particular offence and the rank of the offender—may be roughly defined as 'the fraudulent making or altering of a writing or seal to the prejudice of another man's right, or of a stamp, to the prejudice of the revenue' (*East, Pleas of the Crown*).

The essential elements in the crime of forgery are (1) that there should be in the offender an intention to deceive, and (2) that the fabrication or alteration should be sufficiently skilful to render possible the deception of a person using ordinary observation. It is not necessary that the fraudulent imitation should be exact. The fraudulent application of a real signature to a false document, and of a false signature to a real one, are both forgeries. In Scotland it has been held to be forgery fraudulently to sign the name, or add the cross or mark, of a person unable to write (*Alison's Criminal Law*, i. 374), or the name of another on a false pretence that he gave authority so to do, or for a person to sign his own name with intention to pass off the signature as that of another person bearing the same name.

By the common law of England forgery was a mere misdemeanour, and punishable as such by fine, imprisonment, and the pillory; though capital punishment was the usual penalty for the more serious class of offences under this head. In 1861, however, a statute was passed which made it felony (a) to counterfeit the great seal, the privy seal, the sign manual, the seals of Scotland or of Ireland, any stamp, exchequer bill, bank-note, bill of exchange, deed, receipt, order for the payment of money or the transfer of stock, will, register of births, marriages, and deaths, marriage licence, or any one of various other enumerated documents, or (b) to have in possession without lawful excuse—such excuse to be proved by the party accused—any forged bank-note, &c., knowing it to be forged, or any frames, moulds, plates, paper, &c., used in making such bank-notes. The act also made felonious certain practices connected with, or aiding in, the perpetration of the crime of forgery. By the Forgery Act, 1870, the forgery of stock certificates or of coupons issued by the Bank of England in payment of the interest of the national debt is a felony. Capital punishment in cases of forgery was restricted by acts passed between 1830 and 1832, and abolished in 1837. Under the consolidating Act of 1861 the punishment varies from penal servitude for life to not more than two years' imprisonment, with or without hard labour. See TRADE-MARKS.

Long before the amendment of the laws of evidence, by which parties were admitted as witnesses in their own causes, it was provided in 1829 that the party whose name had been forged might be a witness to the effect that the writing was not his.

Comparison of handwriting is competent, but is not by itself conclusive evidence of forgery. Identification of handwriting is, if possible, more difficult than identification of the person, which so often forms the chief difficulty in criminal trials. 'As illness, strange dress, unusual attitude, and the like, cause mistakes in identifying the individual, so a bad pen, or rough paper, a shaky hand, and many other things change the appearance of a person's handwriting. This kind of evidence ought never, therefore, to be regarded as full proof by the crown in criminal trials; and even in civil cases corroborative evidence should be required, unless the proof of handwriting is so clear as to shift the *onus probandi*.' The best witness is one who has often seen the party write, through whose hands his writing has been continually passing, and whose opinion is not the result of an inspection made on a particular occasion for a special purpose.

The writing of letters in another man's name (as in the forged letters of the Parnell Commission) is not forgery in the statutory sense. See also FRAUD, COINING, RECORDS (FALSIFYING OF).

In the United States, also, falsification of writing is not necessarily forgery in a legal sense; the writing of letters and signing them with the name of another, however injurious to the feelings and interests of that other, is not forgery in law unless pecuniary rights, obligations, or engagements are intended to be directly affected by the false writing. The definition in Bishop's *Criminal Law* (Boston, 1858) is: 'Forgery is the false marking or materially altering, with intent to defraud, of any writing which, if genuine, might apparently be of legal efficacy in the foundation of a legal liability.' At common law the publication or uttering of the forged instrument is not necessary to constitute forgery. But the statutes of the United States generally make the uttering or using of the forged instrument essential to the offence.

LITERARY FORGERIES.—Some of these deserve to be commemorated for their audacity or ability. They are to be distinguished from all use of more or less ingenious pseudonyms, devised to conceal the identity of a writer; and from all writings in imitation of some author's style, and temporarily fathered upon him for mere literary purpose; as well as from so-called *pious* frauds, by which writings honestly intended for edification are connected with some more or less ancient name that commands respect. Such compositions are as deliberate attempts to pass for what they are not are literary forgeries, and are as unpardonable as forgeries of the signature of a London banker. The fictitious account of Formosa, with an alphabet and specimens of a language, published by George Psalmanazar in 1704, was such an imposture as could not long escape discovery. The most famous of such literary forgeries in English literature are connected with the name of Shakespeare—himself but a stalking-horse for another, according to thousands of half-educated people whom no evidence could satisfy. The famous Ireland forgeries began with an autograph of Shakespeare, fabricated by Samuel W. II. Ireland, to gratify his father, but soon grew into a heap of papers, and an entire play, entitled *Vortigern*, which was quickly damned at Drury Lane. The criticisms of Malone, and the alarm of young Ireland's father, necessitated a confession, published in 1796. Twenty years before, Chatterton's Rowley poems had opened up a bitter controversy about their authenticity, from which the boy-poet escaped by untimely suicide; and the Ossianic poems produced by MacPherson (1762-63) have been rank forgeries to a chain of scholars from Dr Johnson to J. F. Campbell, although as vigorously defended by many enthusiastic writers. The famous Perkins Folio of Shakespeare, said by J. P. Collier in 1852 to have been discovered, with an extensive series of contemporary marginal annotations, created a great commotion among Shakespeare scholars, but was at length unanimously condemned, and its annotations proved to be recent fabrications. In 1852 was published by Mr Moxon a series of letters by Shelley, which were discovered a few weeks later to be impudent forgeries, and were at once suppressed by the publisher. It was discovered that there was a brisk trade in the manufacture of letters, autographs, and marginal annotations upon books by Shelley, Byron, and others, and that many of these showed not only great technical skill in imitation, but no mean literary ability in their composition. It would be well for purchasers of letters and autographs of famous persons to make sure of their history, as there is still too good reason to believe that the supply of these is adapted to correspond

with the demand. The most remarkable of all the dupes of literary forgers was Michel Charles (q.v.), upon whom had been passed as many as 27,000 autographs, including those of Pascal, Shakespeare, Dante, and even Julius Cæsar. The fragment of a Moabite Deuteronomy, inscribed on fifteen pieces of sheepskin, brought to London in 1833 by Shapira, was a really skilful imitation, but failed to deceive the practised eyes of Dr Ginsburg and Clermont-Ganneau, and the forger or forger-dupe cut short his humiliation by suicide.

**Forget-me-not** (the name is accounted for by various legends) is *Myosotis palustris*; but the term

Wood Forget-me-not  
(*Myosotis silvatica*):  
a, a flower.

has spread to the larger-flowered species, and indeed to all the members of the species — practically superseding the more prosaic title of Scorpion-grass, derived from the inflorescence so characteristic of the Boraginaceæ, and also that of Mouse-ear, from the hairy leaves. *M. silvatica*, the wood forget-me-not, the Alpine *M. alpestris*, and among exotic species *M. azorica*, are specially worthy of cultivation. *M. versicolor*, a common weed, is remarkable for the change of colour in its

flowers, which not only show the change from red to blue in opening so common in the order, but begin with a distinct yellow.

**Forisfiliation** (lit., 'the putting forth from or beyond the family') is the separation of a child from the family of his father. A child is said to be forisfiliated either when he marries or when he receives from his father a separate stock, the profits of which are enjoyed by himself, though he may still reside with his father, or when he goes to live in another family with the consent of his father. The same result is also brought about when a child renounces his *legitim*—i.e. his legal share of the succession to his father's free movable property.

**Fork.** See CUTLERY.

**Forlì**, capital of the province of the same name in Italy, situated at the foot of the Apennines, in a pleasant and fertile plain, 40 miles SE. of Bologna by rail, is a well-built and handsome city. Of the churches the cathedral, S. Girolamo, and S. Mercuriale are the most notable. In these and in the city gallery are some of the best pictures of Cignani, Guido, Melozzo, Guercino, and others. The citadel, founded in 1361, is now used as a prison. There are manufactures of silk, shoes, hats, and cloth. Forlì (the ancient *Forum Livii*) is said to have been founded by Livius Salinator, after his victory over Hasdrubal, on the Metaurus, 207 B.C. In the middle ages it formed a republic, and during the subsequent struggles of the Guelphs and Ghibellines frequently changed its rulers. In 1860 Forlì, which had been incorporated in the

States of the Church since the time of Pope Julius II., became Italian. Pop. 19,442.

**Forlorn-hope**, the body of men selected to effect a lodgment on a beach, or to lead in scaling the wall of a fortress. Professor Skeat derives the expression from the corresponding Dutch *de verlorren hoop*, the word *hoop* (pron. as English *hope*) meaning a band or troop. The French equivalent term is *enfants perdus*. The name is given on account of the extreme danger to which the leaders of a storming-party are necessarily exposed. As, however, the honour of success is proportionate to the peril of the undertaking, there is ordinarily no lack of volunteers for this arduous service.

**Forma Pauperis.** See IN FORMA PAUPERIS.

**Formation** has by English geologists been generally applied to a group of strata united by some character which they have in common, whether of age, origin, or composition, as the *Carboniferous Limestone formation*, which, together with the formations of the *Millstone Grit* and the *Coal-measures*, constitutes the Carboniferous System. The term is therefore of subordinate importance to *system*. Foreign geologists seldom use formation in this sense. With them the word is descriptive of the materials composing strata, as *chalk formation*, meaning thereby not the Cretaceous System, but beds composed of chalk; so *carboniferous formation* is a group of beds containing coal. To bring our nomenclature into uniformity with that of foreign geologists some purists propose dropping the term formation out of our systems of rock classification. But to do that would require despotic authority, and the term will probably survive in spite of its supposed inconvenience.

**Formes**, KARL, bass singer, was born in 1810 at Mülheim, on the Rhine, and was for some years a veigar before he made his debut on the stage at Cologne, in 1842, as Sarastro in the *Zauberflöte*. He was engaged for a time in Vienna, and sang in Italian opera at Covent Garden until 1857, when he visited America, and entered on a comparatively wandering life, in spite of the possession of a voice that for volume, compass, and quality was one of the most magnificent ever heard. He died at San Francisco, 15th December 1889.—His brother, THEODOR, born in 1826, appeared first at Offen in 1846, and was long one of the most noted tenor singers in Germany. He died in 1874.

**Formia**, formerly Mola di Gaeta, a seaport of Italy, on the Gulf of Gaeta, with 8551 inhabitants. The ancient *Formia*, it became a Roman town in 338 B.C., and was celebrated for its wine. Here are the ruins of Cicero's villa, Formianum.

**Formic Acid**,  $\text{CH}_2\text{O}_2$  or  $\text{HCOOH}$ , derives its name from the circumstance of its having been first obtained from the red ant (*Formica rufa*). It occurs in ants, in the stings of bees, wasps, and nettles, in fir needles, and in various animal secretions. It may be obtained from any of these by distillation with water. Anhydrous formic acid is a mobile liquid of extremely penetrating odour, crystallising at  $35^\circ \text{F.}$ , and boiling at  $214^\circ \text{F.}$ , miscible in all proportions with water and alcohol. It produces a painful blister if dropped on the skin. The aqueous acid is prepared in the following manner: Half a pound of oxalic acid is mixed with one pound of glycine, and the mixture heated in a retort to  $275^\circ \text{F.}$ ; a little dilute formic acid distils; another quantity of oxalic acid is added, and the mixture again heated, and so on indefinitely, the glycerine remaining unchanged at the end of the operation. The decomposition is as follows:

Acid containing 56 per cent. of the pure substance

is obtained in this way. The anhydrous acid is prepared by preparing the lead salt, and decomposing this with sulphuretted hydrogen. It may be formed synthetically in various ways: (1) By direct combination of carbonic oxide,  $\text{CO}$ , and caustic potash,  $\text{KOH}$ , forming  $\text{KCO}_2\text{H}$ , potassium formate; (2) by boiling aqueous prussic acid; (3) by heating chloroform with caustic potash. Formic acid and all its salts (called formates or formiates) are strong reducing agents, and precipitate metal from solutions of gold, silver, or mercury salts. Formic acid is obtained in small quantities by the oxidation of a great number of organic substances. Formates of silver and lead are sparingly soluble; all the others are freely so. By heat they are converted into oxalates yielding pure hydrogen.

**Formosa**, called by the Chinese *Taiwan*, an island lying off the coast of China, over against the province of Fû-chien, from which it is separated by the Fû-chien Strait, varying from 90 to 220 miles in width. Stretching between the limits of  $120^\circ 15'$  and  $122^\circ 5'$  E. long., and  $25^\circ 19'$  and  $21^\circ 54'$  N. lat., Formosa has a maximum length of 235 miles, whilst its breadth varies from 70 to 90 miles. Area, 14,978 sq. m. Forming one link in the volcanic chain that extends from the Aleutian Islands southwards to New Guinea, it constitutes the eastern escarpment of what was once the great Malayo-Chinese continent, and is connected by a submarine plateau with the Chinese mainland. The backbone of the island, extending north and south, is formed of a range of densely-wooded mountains, called by the Chinese Chu-Shan, which rise to upwards of 12,000 feet, the highest known peak, Mount Morrison, being given as 12,847 feet. Eastward of this range lies a narrow strip of mountainous country, presenting to the Pacific a precipitous cliff-wall with in many places a sheer descent of from 5000 to 7000 feet, whilst a very short distance further east the floor of the ocean sinks to a great depth at an extremely steep gradient. The western side of the range consists of a single broad alluvial plain, stretching from north to south of the island, scamed by innumerable water channels, and terminating at the coast-line in mud flats and sand-banks. Yet on this side of the island the land is rapidly encroaching upon the sea, as the consequence of the gradual elevation of the western seaboard and the deposition in and around the embouchures of the rivers of the large amount of sediment brought down by them from the mountains. This latter process is primarily due to the heavy rainfall of the northern, central, and eastern portions of the island, where the rain-clouds of the north-east monsoon, after crossing the warm Kioswo or Japanese Gulf Stream, on coming in contact with the mountain barrier of the island become chilled and discharge their contents in rains of excessive violence. Apart from this heavy rainfall, the climate is not exceptional, the insular position ensuring a modification of the heat by sea-breezes. The mean of summer is  $80^\circ$  to  $90^\circ$  F.; of winter,  $50^\circ$  to  $60^\circ$ . Malarial fever is, however, prevalent in the north, and violent typhoons are very common at certain seasons.

The island is famous for the rich luxuriance of its vegetation, many of our hot-house plants growing wild on the mountain slopes and in the valleys, such as orchids, azaleas, lilies, rhododendrons, and convolvulus; besides which there is a wealthy profusion of ferns, tree-ferns, camphor and teak trees, pines, firs, wild fig-trees, liquidambar, bananas, bamboo, and palms. 'Rice paper' is prepared from the pith of a tree peculiar to Formosa. Of animal life it is noticeable that there are at least forty-three species of birds peculiar to the island, that

insects are scarce, and that noxious wild animals are few, but that fish are plentiful in the waters round the coast. The principal products of commercial importance are tea, sugar, coal, turmeric, rice, sweet potatoes, ground-nuts, bamboos and rattan, grasses, tobacco, timber, the fruit lung-ngan, and sesamum-seed. In the south the staple crops are sugar and turmeric, which were exported from the port of Taiwan in 1887 to the value of £269,030 and £10,483 respectively; and in the north tea, of which 16,858,933 lb. were shipped at Tamsui in 1887, principally to America, Australia, and China, and coal, the export of which fell from 31,000 tons in 1884 to 5767 during the French occupation of Kelung, the port of shipment; but by 1886 it had again risen to 16,659 tons. The imports consist principally of opium, cotton and woollen piece goods, and lead. Sulphur, iron, and petroleum also exist, but are not worked to any extent. Camphor and indigo used formerly to be exported to a large value, but the trade in both is now almost extinct. A very large proportion of the shipping trade is carried on by means of native junks, which ply to and from the mainland; the rest is in the hands of Europeans trading with the open ports of Taiwan and Takow on the south-west, and Tamsui and Kelung on the north. None of these, however, have good harbours, the entrance to each of them being greatly impeded by bars or sand-banks. Besides this great drawback, the island suffers from deficient means of communication, although since 1887 telegraph lines have connected Tamsui with Fû-chow, with Kelung, and with Taiwan and its port Anping, and with the Pescadore Islands, a group, with 8000 inhabitants and two excellent harbours, lying some 20 to 25 miles west of Formosa. A railway was in 1888 being made to connect Kelung with Tswatun, the centre of the tea district.

The inhabitants, estimated to number between one and a half and two millions, consist of Chinese settlers and aborigines. Respecting the ethnological origin of these latter there exists some dubiety; they seem to consist of several different tribes, mainly of Malayan and Negrito descent. The Chinese distribute them into three classes, Peipohwan, a race of civilised and sinicised agriculturists; Sokhwan, settled tribes who acknowledge Chinese rule; and Chinkwan, the untamed savages of the mountains, who wage fierce and unceasing warfare against the Chinese immigrants. The administrative headquarters were formerly at Taiwan, but on the constitution of the island into an independent province of the Chinese empire in 1887—it had formerly been incorporated with Fû-chien on the mainland—they were transferred to Tai-pei or Bangkok. The island was known to the Chinese before the Christian era, but does not seem to have seriously attracted their attention until the year 605 or 606 A.D. In the 14th century they established several colonies in Formosa, which, however, were withdrawn in the middle of the 17th century. Although Portuguese and Spanish navigators began to visit the island a century earlier, the first European people to establish themselves on it were the Dutch, who in 1624 built Fort Zeelandia, near the modern Taiwan. They were, however, expelled in 1661 by a Chinese adventurer, Koxinga, who retained possession of the island for twenty-two years. Some years later a regular Chinese colonisation of the western half of the island was carried through, the colonists coming principally from Fû-chien and Kwang-tung. Subsequently the island became notorious for the piracy of its inhabitants and the ill-treatment they inflicted upon navigators who chanced to be wrecked on their coasts. Accordingly in 1874 the Japanese invaded Formosa; but on the Chinese undertaking to check the evils complained of they withdrew.

Ten years later the French, during their ambiguous contest with China in Tongking, seized upon Kelung, on account of its command of the coal-mines, but vacated it again on the conclusion of peace.

See, besides the older authorities, Guillemard, *Cruise of the Murchison* (1886); A. R. Colquhoun, article in *Sci. Geog. Mag.* (1887); *Consular Reports* (1886 and 1887); Terrien de Lacouperie, in *Jour. Roy. Asiatic Soc.*, vol. xix. part iii. 1887; Girard de Rialle, in *Revue d'Anthropologie* (1885); and G. Taylor, in *Proc. Roy. Geog. Soc.*, April 1889. The *Historical and Geographical Description of Formosa* (1704), by George Psalmanazar (q.v.), is a tissue of inventions.

**Formosa**, a territory in the extreme north of Argentine Republic, formed in 1884, and bounded on three sides by the rivers Pilcomayo, Paraguay, and Bermejo. Estimated area, 44,490 sq. miles. Little is known, even by Argentinians, of the newly-formed territory, which is, however, described generally as a vast plain, gently sinking to the south-east, covered with forests, and in large sections liable to frequent inundations. The summer rains last from October to May. The capital is Formosa (1000 inhabitants), on the Paraguay, about 100 miles NNE. of Corrientes.

**Forms of Address.** See ADDRESS (FORMS OF).

**Formulae.** See CHEMISTRY.

**Forres**, a royal burgh of Elgin-shire, 5 miles S. of Findhorn village, on the Moray Firth, and 25 ENE. of Inverness, with which and Nairn and Fortrose it returns a member to parliament. On its Castle Hill, a royal residence from 1180 to 1371, stands an obelisk (1857), 65 feet high, to the Crimean hero, Dr Thomson of Cromarty; whilst on the wooded Cluny Hill are a hydropathic establishment, and the Nelson tower (1806), 70 feet high. Skene's Stone is a remarkable sculptured monolith, ascribed by Skene to the year 900; the Witch's Stone recalls Macbeth's meeting with the weird sisters near Forres. Public buildings are the town-house, Falconer museum, mechanics' institute, and Anderson's Institution. Pop. (1851) 3468; (1881) 4030; (1891) 3971.

**Forrest, EDWIN**, actor, was born in Philadelphia, 9th March 1806, his father being of Scotch descent, his mother a German, and made his first regular appearance on the stage there in 1820, as Douglas in Home's tragedy. At the age of twenty he appeared as Othello at the old Bowery Theatre in New York, where his immediate success was the foundation of a popularity that survived for many years. He played in London with great success in 1836-37, but at his appearance in 1845 his Macbeth was hissed by the audience; and an unworthy and spiteful resentment that prompted him, a few weeks later, to stand up in a private box in the Edinburgh Theatre and hiss Macready, utterly destroyed his reputation in England and Scotland. A more serious result of his jealous action was the Astor Place riot in New York in 1849, which ensued on the hissing of Macready's Macbeth by Forrest's sympathisers, and which ended in the death of twenty-two men. These events, and the public scandal attendant on a suit for divorce brought by his wife, lessened his fame and embittered his temper. He retired from the stage between 1853 and 1860, when he returned to fill at Niblo's Garden, New York, the most successful engagement of his life. Later tours proved failures, and, after a long struggle against weakness and disease, he made his last appearance as an actor in the part of Richelieu, at the Boston Globe Theatre in 1871. Even then a craving for the old-time applause led him to give readings from Shakespeare in several large towns; but these, too, proved unsuccessful,

and he retired to his home in his native city, where he died of paralysis, 12th December 1872. Forrest's powers as a tragedian were of a very high order; his Lear, Othello, Cato, and several other parts stand out in the memory of those who witnessed them, and were justly ranked in their own day as memorable performances. With him the line of great American actors begins.

**Forrest, JOHN**, Australian explorer, was born at Bunbury in Western Australia, 22d August 1847, and from 1864 onwards was connected with the survey department of the colony. In 1869 he penetrated inland from Perth, in a north-easterly direction, as far as 123° E. long., between 28° and 29° S. lat., through a barren country of salt marshes and scrubby bushes. In the following year he showed that it was possible to reach South Australia from the west by travelling along the south coast of the continent. Along with his brother Alexander, he again made an eastward journey in 1874, setting out from Champion Bay and following generally the line of 26° S. lat. till he came to Peake Station, on the telegraph line connecting Port Darwin and Adelaide. Besides making these exploring journeys John Forrest surveyed that part of north-western Australia lying between the rivers Ashburton and De Grey in 1878, and four years later the Fitzroy district in the same region of Western Australia. He published *Explorations in Australia* (Lond. 1875).—His brother ALEXANDER, also an Australian explorer, was born at Bunbury, September 22, 1849. After taking part with his brother John in his journeys, he in 1879 started, along with Hill, to explore the north-western parts of the Australian continent, an expedition which resulted in the discovery of the fertile pastoral region now called Kimberley District. Besides being well watered, it was also seen to be suitable for the cultivation of such tropical harvests as sugar, coffee, and rice. At the same time the river Fitzroy was ascended for a distance of about 250 miles. This journey was described in *Journal of an Expedition from the De Grey to Port Darwin* (1880).

**Forst**, an industrial town of Prussia, 80 miles SE. of Berlin by rail, had in 1885 a population of 18,563, mostly engaged in manufacturing buckskins, in cloth manufactories, and in tanneries. Forst has also a trade in cattle.

**Förster, FRIEDRICH CHRISTOPH**, poet and historian, born near Kaulburg, in Saxe-Meiningen, on 24th September 1791, devoted himself at first to the study of archaeology and the history of art, but on the outbreak of the war of liberation joined the Lützow sharpshooters along with young Theodor Körner, and, like him, wrote fiery war-songs, stirring up his countrymen against the French. After his return to Berlin he taught for a while in the school of artillery and engineering, but was dismissed for writing a work criticising the Prussian constitution. In 1829, however, he was appointed a custodian of the Royal Art Museum at Berlin, where he died on 8th November 1868. He wrote several popular historical works, dealing chiefly with the war of liberation and the history of Prussia, including a collection of biographical sketches entitled *Preussens Helden im Krieg und Frieden*; and, besides these, three works on Wallenstein; a *History of Frederick William I.* (3 vols. 1835); *Urkundenbuch* (new ed. 2 vols. 1839); and *Die Höfe und Kabinette Europas im 18. Jahrhundert* (3 vols. 1836-39). His *Gedichte* appeared in 2 vols. 1838.

His brother ERNST, painter and writer, was born 8th April 1800. His passion for art was first awakened by Cornelius, under whose direction he executed various fresco pieces in Bonn and

Munich, from 1823 to 1825. An expedition to Italy for the purpose of making drawings from the old masters bore fruit in *Contributions to the History of Modern Art* (1836). From this time he abandoned painting and devoted himself almost exclusively to investigations bearing upon the history of art, his principal books being *Letters on Painting* (1838); *History of German Art* (5 vols. 1851-60); *Monuments of German Architecture, Sculpture, and Painting* (12 vols. 1853-69); *Introduction to the History of Art* (1862); biographies of Fra Angelico (1859), J. G. Müller (1831), Raphael (1867-68), and Cornelius (1874), and a translation, in conjunction with Schorn, of Vasari's *Lives of the Painters*. At the time of his death, on 29th April 1885 at Munich, Forster left two large works unfinished, a *History of Italian Art* (5 vols. 1869-78), and *Monuments of Italian Painting* (4 vols. 1870-82). He also edited the posthumous works of his father-in-law, Jean Paul (1836-38), and wrote several biographical works relating to the great humorist, the chief being the last five volumes of *Witzheit aus Jean Pauls Leben* (1827-33).

**Forster, JOHANN REINHOLD**, a German traveller and naturalist, was born in Dirschau, in Prussia, on 22d October 1729. He was educated at Halle and Danzig for the clerical profession, but his favourite studies were languages, botany, and zoology. Repairing to England in 1766, he acted for a few years as a teacher at Warrington in Lancashire, until he was appointed to accompany Cook as naturalist during his second voyage in 1772. On Forster's return his son published an account of the journey from Forster's own note-books, whilst Forster himself wrote *Observations made during a Voyage round the World* (1778), chiefly on physical geography and natural history. Two years afterwards he received the appointment of professor of Natural History at Halle, where he died on 9th December 1798. He wrote also a work on *Mineralogy* (1768), one on the *Dysus of the Ancients* (1770), *Flora America Septentrionalis* (1771), *Zoologic Ravioris Specilegium* (1781), an *Account of the South Sea Plants* (1776), and *Geschichte der Entdeckungen und Schiffahrten im Norden* (1784).—His eldest son, JOHANN GEORG ADAM, was born near Danzig, on 26th November 1754. When only seventeen years of age, he accompanied his father in Captain Cook's second voyage, and published, with the assistance of his father, an account of the expedition. After living as professor of Natural History at Cassel and at Vienna, he became librarian to the Elector of Mainz in 1788. Whilst he was on a visit at Paris in 1792, whither he had been sent to request the incorporation of Mainz with the French republic, the Prussians retook Mainz, and Forster lost all his property, including his books and manuscripts. He died at Paris, 12th January 1794. His writings, especially his *Ansichten vom Niederrhein* (1791-94) and his *Beschreibung einer Reise um die Welt* (1784), take a high rank amongst German works descriptive of nature. His Letters were published by his widow in 1829; and a complete edition of his works appeared in 9 vols. in 1843.

**Forster, JOHN**, an English political and historical writer, was born at Newcastle, 2d April 1812. He was educated for the bar, but early devoted himself to periodical writing. His political articles in the London *Examiner*, for which he commenced writing in 1834, attracted more attention than is usually bestowed on newspaper leaders, owing to their vigour and point, coupled with the love of truth, consistency, and outspoken honesty they displayed. Forster edited the *Foreign Quarterly Review* for some time; then for nearly a year, as Dickens's successor, the *Daily News*, and from 1847 to 1856 the *Examiner*. He was the author

of many admirable biographical and historical essays, as the two volumes of *Edinburgh and Quarterly* articles reprinted in 1858, and an admirable series dealing with the times and statesmen of the English Commonwealth, under the titles *History of the Grand Remonstrance* (1860); *Arrest of the Five Members* (1860); *Sir John Eliot, a Biography* (1864); and *Lives of the Statesmen of the Commonwealth* (1840). His literary memoirs are *The Life and Times of Oliver Goldsmith* (1848; 2d and improved ed. 1854), accounted one of the best biographies in English literature; *Walter Savage Landor* (2 vols. 1868); *The Life of Charles Dickens* (3 vols. 1871-74); and the first volume of a *Life of Swift* (1875). His life of Dickens was assailed as having exposed with too great frankness the failings of his hero; a more valid objection is that in the method of treatment adopted the biographer is almost as prominent as his subject. Forster's style is clear and forcible. He himself was an indefatigable student and a constant and devoted friend. He was appointed secretary to the Commissioners in Lunacy in 1835, and a Commissioner in Lunacy in 1861. He died 1st February 1876.

**Forster, WILLIAM EDWARD**, statesman, was born at Bradpole, Dorsetshire, July 11, 1819, the son of an esteemed minister of the Society of Friends, who died while on an anti-slavery mission in Tennessee, in 1854. Educated at the Friends' School at Tottenham, he first contemplated going to the bar, but abandoned this intention for commerce, and accepted an appointment in a woollen manufactory at Bradford. He early took an interest in philanthropic and political questions, and during the terrible Irish famine of 1845 visited the distressed districts as almoner of a relief fund raised by his co-religionists. In 1850 he married Jane, eldest daughter of Dr Arnold of Rugby, and sister of Matthew Arnold. Forster unsuccessfully contested Leeds in the Liberal interest in 1859, but two years later was returned for Bradford. After serving for thirteen months as Under-secretary for the Colonies (1865-66), he became in 1868 Vice-president of the Council on Education, and a privy-councillor. He accepted from Mr Gladstone a seat in the cabinet in 1870, and the same year introduced the greatest legislative measure associated with his name, the Elementary Education Bill (see EDUCATION). His conduct of the bill was marked by great ability, but it led him into strong conflict with the Nonconformist members and the Birmingham League, who objected to the 25th clause, which enabled school boards to pay the fees of indigent children at denominational schools out of the rates. In 1872 Forster introduced the Ballot Bill, which he piloted through the House of Commons with much skill. After the resignation of the Liberal ministry in 1874, he visited the United States. His father's memory was warmly cherished by the abolitionists, and Forster himself, who had always been a staunch supporter of the Union, and an uncompromising enemy to slavery, received an enthusiastic welcome. He had counted among his personal friends Emerson, Adams, and Sumner. On the retirement of Mr Gladstone from the leadership of the Liberal party in January 1875, Forster and Lord Hastington were named for the post, but the former wrote withdrawing from candidature, on the ground that he could not hope to unite the various sections of the party. In the ensuing November he was elected Lord Rector of Aberdeen University.

In the Gladstone administration of 1880 Forster accepted the office of Chief-secretary for Ireland, at that time the most onerous post in the government. He had not coveted the appointment, but assumed it patriotically, in the hope of being able

to grapple with the Irish problem. An agrarian and political agitation was then disturbing a large portion of Ireland. Forster was attacked unceasingly in parliament by the Irish members, and his life was threatened by the 'Invincibles,' who afterwards assassinated his successor, Lord Frederick Cavendish, together with Mr Burke. More than one thousand evictions having taken place in Ireland during the first six months of 1880, Forster carried through the House of Commons the Compensation for Disturbance Bill, intended for the relief of deserving tenants evicted for non-payment of rents which they were unable to discharge. The measure was rejected by the Lords; and this proved a great blow to Forster, who believed that by its aid the government would have been able to cope with the rising influence of Mr Parnell, and with the growing agitation among the Irish peasantry. A land act was passed in 1881, but a coercion act was also necessary for the suppression of agrarian crime; and, when the Land League issued its 'No Rent' manifesto, Forster replied by a proclamation declaring the League illegal. Mr Parnell and several members of his party were arrested. Induced to adopt a change of policy by the continued disturbed condition of Ireland, in April 1882 a majority of the cabinet determined to release the 'suspects,' whereupon Forster and Lord Cowper (the Lord-lieutenant) resigned. Considerable excitement arose over what was known as 'the Kilmainham Treaty,' and Forster was much applauded by the Conservatives for his policy in this matter, and for his attitude on the Irish question generally. Forster subsequently condemned the government for their action in Bechuanaland and also in the Sudan; and he supported the unsuccessful vote of censure upon them, proposed after the death of General Gordon. Forster took a profound interest in the Imperial Federation Scheme, being anxious to strengthen the bonds between Great Britain and her colonies. With regard to Home Rule, he believed that 'a parliament in Dublin would be fraught with danger to both England and Ireland.' At the general election of November 1885 he was again returned for Bradford, in his absence through illness, by a majority of 1543 votes. He died in London, April 5, 1886. In character Forster was loyal, honest, unselfish, and courageous. He was an effective parliamentary speaker, from his straightforwardness and earnestness of conviction, but he had none of the shining gifts of oratory. His undoubted patriotism, his great abilities, and his sturdy independence will give him an honourable place amongst British statesmen. See *Life by Wemyss Reid* (1888).

**Forsyth**, SIR THOMAS DOUGLAS, an Indian civilian, was born in Liverpool in 1827, entered the Company's service in 1848, and was employed in the administration of the Punjab until 1870, being created C.B. for his services during the mutiny. In 1870 he conducted a mission to Yarkand in eastern Turkestan, and in 1874, having crossed the great ranges that separate Kashgar from India, he concluded a commercial treaty with the emir. The reports of these missions contain much valuable geographical information. On his return Forsyth was made K. C. S. I. and a member of the Legislative Council of India; and in 1875 he succeeded, acting as envoy, in averting a possible war with Burmah. He died 17th December 1886.

**Fort Augustus**, a village on the Caledonian Canal, at the head of Loch Ness, 33 miles SW. of Inverness. A barracks built here in 1716 to awe the disaffected clans was enlarged in 1730 by General Wade, who named it Fort Augustus, out of compliment to William Augustus, Duke of Cumberland. The rebels captured and dismantled it in

1746, but it was soon restored, and garrisoned down to the 'Crimcan war. In 1857 it was sold to Lord Lovat, whose son nineteen years afterwards presented it to the Benedictines (q.v.); and by them during 1876-82 it was converted into a stately abbey, college, and hospice.

**Fort de France** (formerly *Fort Royal*), capital of Martinique, in the French West Indies, lies on the west coast, has an excellent harbour, and is defended by several forts. Its pop. of 8000 is principally made up of the military and officials.

**Fortescue**, SIR JOHN, judge and writer on English law, was born in Somersetshire towards the close of the 14th century, and educated at Exeter College, Oxford. Called to the bar at Lincoln's Inn, he was in 1441 made serjeant-at-law, and in the following year Lord Chief-justice of the Court of King's Bench. In the struggle between the Houses of York and Lancaster he steadily adhered to the latter, and was attainted by the parliament under Edward IV. He accompanied Margaret of Anjou and her young son, Prince Edward, on their flight into Scotland, and is there supposed to have been appointed Lord Chancellor by Henry VI. In 1463 he embarked with the queen and her son for Holland. During his exile he wrote his celebrated work, *De Laudibus Legum Angliæ*, for the instruction of Prince Edward, who was his pupil. But on the final defeat of the Lancastrian party at the battle of Tewkesbury, 1471, where he is said to have been taken prisoner, Fortescue submitted to Edward IV. He died in about the ninetieth year of his age. The *De Laudibus Legum* was not printed until the reign of Henry VIII.; another valuable work by Fortescue is *The Governance of England; otherwise called the Difference between an Absolute and Limited Monarchy*, written in English (1714; new ed. by Plummer: Clarendon Press, 1886). His collected works were printed for private circulation by Lord Clermont in 1869.

**Forteviot**, the ancient capital of the Picts (q.v.). Its site is about 7 miles SW. of Perth.

**Fort Garry**. See WINNIPEG.

**Fort George**, a fortress 12 miles NE. of Inverness, on a low sandy projection into the Moray Firth, here only 1 mile broad. Built in 1748 at a cost of £160,000, it covers 12 acres, and can accommodate 2180 men. It is the dépôt of the Seaforth Highlanders.

**Forth**, a river and firth of Scotland. The river is formed by two head-streams, Duchray Water and the Avonduih, which, rising on and not far from Ben Lomond, at altitudes of 3000 and 1900 feet, run 14 and 9 miles to a confluence near Aberfoyle, the Avonduih traversing Lochs Chon and Ard. From their confluence, 80 feet above sea-level, the Forth itself winds 39 miles to Stirling, then 12½ (the 'Links of Forth') to Alloa, the distances in a straight line being only 18½ and 5½ miles. It receives the Teith, Allan Water, and Devon, and traverses or divides Stirling, Perth, and Clackmannan shires.

The Firth of Forth extends 51 miles eastward from Alloa to the German Ocean, between Clackmannanshire, Perthshire, and Fife on the north, and Stirlingshire and the Lothians on the south. It has a width of ½ mile at Kincaidine, 3 miles above Bo'ness, 1½ at Queensferry, 5 between Granton and Burntisland, 17 at Prestounpans, and 8½ at Elie. Its waters, 3 to 37 fathoms deep, encircle the islands of Inchkeith (fortified 1878-81), Inchcolm (with a ruined abbey), Cramond, &c., whilst at the entrance are the Bass Rock (q.v.) and the Isle of May, on which last and on Inchkeith are lighthouses. Rivers falling into it are the Carron, Avon, Almond, Water of Leith, Esk, and Leven.

White fish are plentiful. In 1882-89 a great railway bridge was erected across the firth at Queensferry (see BUDGE), above which is St Margaret's Hope, one of the safest roadsteads in the kingdom.

**Fortification** is the art of strengthening a locality by various means against the attack of hostile troops. It has two distinct branches, called Field and Permanent fortification. The former comprises such slight *entrenchments* or *field defences* as can be executed by the troops themselves during the few hours which precede an engagement in the open field, as well as the more elaborate *field-works* requiring days or weeks to construct, which are found to be tactically necessary as the campaign progresses. The latter deals with engineering works of a widely different character, though based on the same principles, constructed in time of peace to secure points of which the importance in time of war can be foreseen. Years may be spent in perfecting them, and durable materials, such as iron and masonry, are largely used in their construction. Fortification includes also the operations connected with SIEGES and military MINES, which are described under those articles.

**FIELD FORTIFICATION**, while aiming at giving to the defenders of a chosen position all the advantages of cover from the enemy's fire, and obliging him to advance over open ground completely swept by their fire, must also allow of free movement in counter attack of considerable bodies of troops. It follows that such defences are made of slight profile throughout the greater part of the front, so as

and woven together with wire run through it, or of several lines of barbed wire attached to stakes about 4 feet high and 6 feet apart; *military pits* or *trous-de-loup*, 2 feet 6 inches deep and staked at the bottom, sometimes also covered with wire entanglement; and, if possible, *inundations*.

The more important points only of such a position would be really fortified by the erection of field redoubts, generally of the type shown in fig. 1, forming strong points in the main line, advanced posts in its front or a second line of works in rear, 500 to 2500 yards apart, and probably each garrisoned by half a battalion with two or four guns. A redoubt of the shape shown in fig. 1 is called a *blunted redan*; a *redan* or *flèche* has two faces only, meeting at an angle of something over 60°, while a *lanette* has five, two faces, two flanks, and a *gorge* or rear face. The faces and flanks of all such works are formed by parapets (Ital. *parapetto*; *parare petto*, 'guard the breast') 12 to 16 feet thick, to resist artillery, while their gorges would simply be closed by a light parapet 3 feet thick, or a *stockade* (wall of bullet-proof timber), unless likely also to be exposed to artillery fire, when they are the same as the other faces. Like the *fosse* and *rutilin* in Roman Camps (q.v.), the ditch of a field redoubt forms an obstacle to the assault, and is necessary to provide earth for the parapet, its dimensions depending upon the amount required. Its sides (*escarp* and *counterescarp*) are made as steep as the earth will stand. Sometimes strong palings called *palisades* are planted in the bottom, and similar ones called *graves* made to project

over the ditch from the counter-escarp and from the *berm*, or space often necessarily left to prevent the scarp giving way under the weight of the parapet. These increase the value of the ditch as an impediment to the assault, and a wire entanglement is often placed in it to hinder the assailants from using the cover afforded by it to re-form before rushing over the parapet. The *exterior* (front) *slope* of the parapet is left at the natural slope of the ground to minimise the effect of artillery projectiles upon it. The *superior* (top) *slope* inclines at 1 in 6 to enable the men firing over it to see the ground in front of the ditch without unduly weakening the *crest* or highest point of the parapet. The *interior* (rear) *slope* is revetted with *gabions*, *sandbags*, *sods*, *hurdles*, or other materials, and stands at a slope of 1 or 1½. The men stand on a *banquette* 4 feet 6 inches below the crest, approached by steps or a slope. The height above the ground of the crest of the parapet, called its *command*, would never exceed 12 feet in a field redoubt. Field Case-mates (q.v.) of timber are made under the banquettes and under the traverses or *parados* (Italian, 'protect the back') which defend the men on the rear face against fire coming from the front. The guns in the flanks fire through *embrasures*, and are protected from enfilade fire by traverses alongside them. Those on the faces are mounted on gun banks, called *barbettes*, firing over the crest and in several directions. The work is made shallow, so that the flanks may be short and not easily enfiladed. The gorge parapet is lowered in two places in order to lessen the necessary height of the traverses, and it may be flanked by a small redan of earth, or a *tambour* (stockade work) projecting from its centre; the entrance is covered by a few riflemen mounted on one of the traverses. The front faces are flanked by fire from collateral

aa, bonnettes; bb, barbettes; cc, traverses; dd, parados. The diagonal shading indicates the position of case-mates. North.—In this and in Figs. 2, 3, 4, and 5 the which are given in feet relatively to the plane of site (+ above, - below).

to be no impediment to the advance, and the introduction of the far-ranging breech-loading rifle has given such power to the defence that this can safely be done if a wide front of fire is maintained. The preparation of a position consists in arranging for defence any buildings which exist on it and are favourably situated, loopholing them and the walls enclosing them, improving the cover given by hedges and ditches along the front, and, where those do not exist, digging shelter trenches 18 inches deep and 5 feet wide for the accommodation of the shooting line, deeper trenches in rear for supports, and gun pits or epaulements for the artillery. Parts of this line would be traced so as to flank the general front, and no cover would be left for the enemy during his advance. Hollows which cannot be seen into from the shooting line would be filled up with brushwood, obtained by clearing away the hedges in the front, and obstacles would be placed so as to confine the enemy to the least favourable lines of advance, or to detain him under fire. Besides *Abattis* (q.v.), the chief obstacles thus used are: *entanglements*, either of brushwood cut half through

and woven together with wire run through it, or of several lines of barbed wire attached to stakes about 4 feet high and 6 feet apart; *military pits* or *trous-de-loup*, 2 feet 6 inches deep and staked at the bottom, sometimes also covered with wire entanglement; and, if possible, *inundations*. The more important points only of such a position would be really fortified by the erection of field redoubts, generally of the type shown in fig. 1, forming strong points in the main line, advanced posts in its front or a second line of works in rear, 500 to 2500 yards apart, and probably each garrisoned by half a battalion with two or four guns. A redoubt of the shape shown in fig. 1 is called a *blunted redan*; a *redan* or *flèche* has two faces only, meeting at an angle of something over 60°, while a *lanette* has five, two faces, two flanks, and a *gorge* or rear face. The faces and flanks of all such works are formed by parapets (Ital. *parapetto*; *parare petto*, 'guard the breast') 12 to 16 feet thick, to resist artillery, while their gorges would simply be closed by a light parapet 3 feet thick, or a *stockade* (wall of bullet-proof timber), unless likely also to be exposed to artillery fire, when they are the same as the other faces. Like the *fosse* and *rutilin* in Roman Camps (q.v.), the ditch of a field redoubt forms an obstacle to the assault, and is necessary to provide earth for the parapet, its dimensions depending upon the amount required. Its sides (*escarp* and *counterescarp*) are made as steep as the earth will stand. Sometimes strong palings called *palisades* are planted in the bottom, and similar ones called *graves* made to project over the ditch from the counter-escarp and from the *berm*, or space often necessarily left to prevent the scarp giving way under the weight of the parapet. These increase the value of the ditch as an impediment to the assault, and a wire entanglement is often placed in it to hinder the assailants from using the cover afforded by it to re-form before rushing over the parapet. The *exterior* (front) *slope* of the parapet is left at the natural slope of the ground to minimise the effect of artillery projectiles upon it. The *superior* (top) *slope* inclines at 1 in 6 to enable the men firing over it to see the ground in front of the ditch without unduly weakening the *crest* or highest point of the parapet. The *interior* (rear) *slope* is revetted with *gabions*, *sandbags*, *sods*, *hurdles*, or other materials, and stands at a slope of 1 or 1½. The men stand on a *banquette* 4 feet 6 inches below the crest, approached by steps or a slope. The height above the ground of the crest of the parapet, called its *command*, would never exceed 12 feet in a field redoubt. Field Case-mates (q.v.) of timber are made under the banquettes and under the traverses or *parados* (Italian, 'protect the back') which defend the men on the rear face against fire coming from the front. The guns in the flanks fire through *embrasures*, and are protected from enfilade fire by traverses alongside them. Those on the faces are mounted on gun banks, called *barbettes*, firing over the crest and in several directions. The work is made shallow, so that the flanks may be short and not easily enfiladed. The gorge parapet is lowered in two places in order to lessen the necessary height of the traverses, and it may be flanked by a small redan of earth, or a *tambour* (stockade work) projecting from its centre; the entrance is covered by a few riflemen mounted on one of the traverses. The front faces are flanked by fire from collateral

works, and the ditches sometimes defended by *caponiers* (stockade work roofed with earth) placed in them at the *shoulders* or angles between the faces and flanks. The parapets at the shoulders are raised for a short distance, to give better cover, by an arrangement called a *bonnette*. Such a redoubt would not take more than 18 to 24 hours to complete, and yet would be capable of withstanding the fire of field-guns. The redoubts for which sites were selected in 1889 round London would be of this type, but probably of larger size. They would not be commenced until war was declared or imminent, could then be rapidly completed, and are well adapted to form strong points or pivots in the line of defence taken up by the field army, especially as the enemy would not be likely to have landed any but field-guns. Field redoubts having an all-round defence may be of any shape best suited to the ground, but have never less than three sides. If

only be used in mountain warfare, where artillery could not be brought to the attack, and where timber was plentiful.

PERMANENT FORTIFICATION, for the protection of cities, harbours, tracts of country, bridges (see BRIDGE-HEAD), roads, &c., dates from the earliest ages. Its aim formerly was to keep out the enemy by passive resistance unaccompanied by counter attacks, except in the form of sorties to destroy his siege-works and batteries. Since 1859, however, the same principle of detached works and free manœuvring ground between them for counter attack which has been applied to field fortification has been adopted for permanent works. This is due to the vast improvements in artillery and small-arms, the former easily destroying the strongest works at long distances, and the latter, on the other hand, increasing the power of armies in the open field. The change has been gradual but progressive. In

Greek history we read of cities surrounded with walls of brick, stone, and rubble. Babylon had a wall of prodigious circuit—100 feet high, 32 feet thick, and surmounted by towers. Jerusalem, at the time of Vespasian's siege, had similar walls, with masonry of enormous solidity. But the square and round towers, which had formed sufficient flanking defence against arrows, and the walls which had resisted battering-rams, were soon found to be useless against artillery, and other devices had to be resorted to.

*Bastion System.*—Early in the 15th century the Italians commenced to flank their walls with small bastions. Those at Verona, built by Micheli in 1523, are usually looked upon as the oldest extant. Tartaglia and Albert Dürer, painter and engineer, Marliani, an Italian, who died 1599, Errard Bois-le-Duc and De Ville, under Henry IV. and Louis XIII. of France, and the Count de Pagan, whose treatise appeared in 1645, did much towards laying the foundation of that science which Vauban subsequently brought almost to perfection. Born in 1633, this great engineer was equally distinguished in peace and in war. After having taught how

Fig. 2.

A, section through face, AA, fig. 1; B, section through gorge, BB, fig. 1

square or circular, their fire is much dispersed. The Plevna redoubt, so celebrated in the Russo-Turkish campaign of 1878, was square; but some sort of polygon is more usual. The *Bastion* (q.v.) and *star* traces have been abandoned as too complicated for field fortification. Continuous lines of parapet would sometimes still be used to connect two redoubts, and might be *indented* so as to increase the flank defence, but these require no detailed description. *Blockhouses* (q.v.) would

Fig. 3.—Vauban's First System (ground-plan):

fortresses could be rendered almost impregnable, he was led by the restless ambition of his master, Louis XIV., to demonstrate that the reduction of

any work was a mere question of time and powder, so that even he himself could not construct a rampart that should withstand the fire brought

against it by his system of attack. He constructed thirty-three new fortresses, improved above one hundred, and conducted personally more than fifty sieges. Coehoorn, director-general of the fortresses of the United Provinces, was the contemporary, rival, and opponent of Vauban; his master piece was Bergen-op-Zoom. Cormontaigne, Belidor, Bessard, and Carnot may also be mentioned as conspicuous followers of Vauban's principal theories. Their works all begin by surrounding the place with a continuous polygon, on each side of which a bastion front, covered by outworks, is constructed.

Fig. 3 shows Vauban's first system in plan; fig. 4 in profile. All the others, and the so called

modern French system, are merely elaborations of it.

The *enceinte*, or main body of the place, is traced as follows, if the polygon taken is an octagon. The exterior side, about 380 yards long, *ab* (fig. 3), is bisected in *c* by the perpendicular *cC*, which is made one-sixth of *ab*; *aC*, *bC* are joined and produced, and the faces of the bastions *ad*, *bg*, each equal to two-sevenths *ab*, are measured along them. Next, from *a* and *b* as centres, with radius *ag*, arcs are described cutting *aC*, *bC*, produced in *f* and *e*; *de*, *fg* form the flanks of bastions, and *ef* the curtain. The rampart is formed from the earth excavated from the ditch, and the parapet built on it. Fire from the

Fig. 4.—Vauban's First System (profile):

*a*, rampart; *b*, banquettes; *c*, parapet; *d*, revetment; *e*, escarp; *f*, counterscarp.

faces of the bastions and curtain covers the entire front, while that from the flanks sweeps along the faces of adjoining bastions and the curtain. The fire upon the salient angle of each bastion is, however, very oblique, and, as this is the most favourable line of advance for the besieger, it is further flanked by a ravelin (*F*), sometimes called a *redan* or *demi-lune*, which forms an outwork on the far side of the main ditch. This ditch, if dry, is 30 yards wide, and, if wet, 36 yards at the angles of the bastion, and its counterscarp is thence directed upon the opposite shoulders, *d* and *g*.

The capital, *hi*, of the ravelin is set off 100 yards along the perpendicular, and its faces traced from *i* to points situated in the faces of the bastions, 10 yards from the shoulders, so as to protect them from guns firing along the ditch of the ravelin, which is 20 yards wide, with counterscarp parallel to the escarp. The covered way, *f*, 10 yards wide, is covered by the *glacis*, *K*, 8 or 10 feet high, and sloping gradually towards the country. Traverses in it prevent its being enfiladed. The *tenaille*, *C*, is a low parapet sweeping the interior of the ravelin and the ditch; it also protects the scarp revetments of the bastions and curtain.

The *caponier*, *D*, forming a communication between the *tenaille* and the ravelin, consists of a passage between two low parapets, each with a glacis sloping towards the ditch, which is swept by their fire. At the re-entering angles of the covered way *places of arms*, *I*, are formed by setting off 30 yards along each counterscarp for the gorge, and making the faces enclose a salient angle of 100°. These, and the *salient place of arms*, *II*, are convenient for preparing sorties.

Vauban's second and third systems adapted old walls to his improvements. He placed counter-guards in front of the existing corner-towers, thereby making hollow bastions, and avoiding the necessity of entirely rebuilding, and added a redoubt to the ravelin.

Coehoorn's system had counter-guards in front of the bastions and parallel to them. The angle of his ravelin was always 70°, and his flanks were protected by curved shoulders called *orillons*.

Cormontaigne widened the gorge of his ravelin, thereby reducing the length of the bastion face exposed to breaching. He also revived the step-like formation of the covered way, originally seen in the system of the great German engineer, Speckle (died 1589), which gives defenders a continued line

of fire from each traverse along the covered way; and he placed redoubts in the re-entering places of arms.

The modern French system differs but little from that of Cormontaigne. The re-entering places of arms have circular fronts instead of angular; the angle of the ravelin is 60°, has traverses in its ditch, and ditches called *coupoirs* are cut through its faces so that it need not be entirely surrendered when the salient is captured. Many additions were made as new fortresses were built, such as *Horn-works* and *Crown-works* (q.v.) in advance of the ravelins, *fausses brayes* or lower parapets outside the bastions, and *cavaliers* or elevated retrenchments inside them. As the increased power of artillery made itself felt, various methods of covering the masonry of the scarp were devised; these were called *counter-guards*, *couvre faces*, or *envelopes*, and did for the faces of the bastions what the *tenaille* does for the curtain.

The *tenaille* or star trace consists of alternate salient and re-entering angles, the latter being not less than 90°. Ravelins and other outworks are added as in the bastion trace. It was chiefly used by Montalambert (1714-1800), but has many defects—e.g. the salients are easily enfiladed; the interior space is confined; the defence of the main ditch from the ramparts is very imperfect; and if casemates are used at the re-entering angles to remedy this defect, they can be destroyed by the enemy's fire passing along the ditch.

The *Polygonal System*.—Early in the 18th century the German engineers had recognised that the 'polygonal system' of fortification invented by Montalambert was better adapted to the increased range and accuracy of artillery fire. This system placed the parapets of the *enceinte* along the sides of the polygon, sometimes broken slightly outwards or inwards, and always flanked by strong casemated caponiers projecting from their centres. These caponiers mount thirty to forty guns in two or three tiers, firing through *masks* or *tunnels* in many cases, and are themselves protected by counter-guards and ravelins, besides being flanked from batteries in rear. Fig. 5, a half-front of the Antwerp *enceinte* (1859), as fortified by General Brialmont of the Belgian Engineers, is perhaps the best example of this system. Besides simplicity, each front has greater length (1200 yards as against 400), better bombproof cover, communications, retrenchments, and flank defence. It is more easily adapted to the site. Its ravelins are wider, but

support one another less, and it is more vulnerable to attack by mining.

But the fortifications of Antwerp also illustrate

and intended for rifles and field-guns repelling an assault only; but a few heavy guns in Monciéff Pits (q.v.) may be placed at its angles. This device is another tribute to the power of the attacking artillery. Masonry can no longer be exposed to its fire, and even iron shields and cupolas are not satisfactory. Iron turrets are too expensive for general use, but are applied to confined spaces and in coast defences—e.g. on the Admiralty Pier at Dover.

The conditions to be considered in the fortification of a dockyard or seaport differ from those applicable to the case of an inland town, inasmuch as the very heaviest guns can be brought against it by the hostile ships, and it can be now bombarded with effect at immense distances (8000 to 10,000 yards). The first line of fixed defence would consist of submarine mines laid chequerwise in the channels of approach. To prevent the enemy's boats removing these or destroying them by countermines, shore batteries must be thrown up able to resist the attacks of a landing party, and armed with quick-firing (see CANNON) and Machine Guns (q.v.), while guard-boats similarly armed constantly patrol the neighbourhood. Position-finding stations must be selected, and electric lights provided, as well as swift steamers to scout in front, and torpedo boats to make counter-

attacks supported by any available war-ships. For the inner defence the heaviest available guns should

Fig. 5.—Half-front of the Enceinte of Antwerp.

another change in this science, by which advanced works close to the enceinte were replaced by a chain of detached forts 3 to 5 miles from it. The value of a chain of redoubts was proved at Pultowa, Fontenoy, Torres Vedras, and Dresden. D'Aicon first, and Roguier after him in 1816, both of the French Engineers, strongly advocated the 'camp-fortress,' as it is called by the Austrians, and it soon became the only recognised system of fortification. It has been applied to Portsmouth, Plymouth, Paris, the Rhine fortresses, throughout the Franco-German frontier, and wherever modern defences have become necessary.

At Antwerp the forts are about  $1\frac{1}{2}$  mile apart, and 2 to 3 miles in front of the enceinte. Each has 700 yards of front, 120 guns, 15 mortars, and a garrison of 1000 men. They are blunted redans like fig. 1, flanked in front by strong caponiers mounting 14 guns, and in rear by a casemated keep and earthen redan. If attacked, supporting batteries would be thrown up between them, and before the enceinte could be reached at least two must be captured, an operation which would be extremely difficult in face of the army that would be collected within the area (some 200 sq. m.) enclosed by the chain of forts. Connection between them is maintained by a circular railway.

Since the war of 1870-71 the whole of France has been converted into a 'camp-fortress.' Paris has a triple line of works extending over a perimeter of some 90 miles. Outside this are the entrenched camps of Epinal, Belfort, Langres, Besançon, La Fère, Rheims, Verdun, Toul, the plateau of Haye, Nancy, Dijon, and Lyons, while farther to the front the chain of *forts d'arrêt* along the eastern frontier bars every road or railway.

Fig. 6 shows a detached fort, with the interior battery adopted in the British type. The heavy guns are placed in this battery, and are protected by the outer parapet, which is made a little higher

Fig. 6.—Half Plan of Detached Fort:  
The diagonal shading indicates casemates.

be mounted on hydro-pneumatic disappearing carriages, or in wrought-iron turrets supported by

howitzers and mortars. The fortifications would consist on the sea front of these batteries, and on the land front of detached forts similar to those already described.

An estimate prepared in 1886 by Colonel Schaw, R. E., for an 'ideal defence of the entrance to Plymouth harbour,' amounts to £833,000, and includes four 68-ton guns, two in a turret; eighteen 10-inch and eighteen 6-inch guns; twenty heavy howitzers; four Brennan torpedoes; three Nordenfeldt submarine boats; submarine mines; electric lights; and a flotilla for laying and guarding the mines. The new fortifications of Antwerp are believed to have cost £3,000,000; the German alterations on Strasburg and Metz cost £4,000,000; several of the new eastern French fortresses cost each about £3,000,000. In peace Metz has a garrison of 10,000 men; Strasburg about 9000.

See works by General Brialmont (Brussels, 1869); Captain Wagner (Berlin, 1872); Captain Brunner (3d ed. Vienna, 1880); Captain Phillips, R. E.; Major Sydenham Clarke (1891); and the *Textbook of Military Engineering* used at Woolwich.

**Fortiguerra**, NICCOLO, an Italian poet, was born at Pistoia in 1674. He proceeded to Rome at an early period, and was speedily raised to the dignity of bishop and papal chamberlain by Clement XI. The greater part of his attention was given to letters; but he is now remembered only as the author of a satirical epic entitled *Il Ricciardotto* (1738), which is praised by his countrymen for its natural humour, grace of style, and elegance of versification. The best edition is one published at Milan in 3 vols. in 1813. Fortiguerra died at Rome, 17th February 1735.

**Fort Madison**, capital of Lee county, Iowa, on the Mississippi River, 19 miles SW. of Burlington by rail, with a state prison, and manufactures of chairs, farming implements, and boots. Pop. 4925.

**Fortrose**, a watering-place of Ross-shire, on the inner Moray Firth, 10 miles NNE. of Inverness. It is one of the Inverness burghs; and its two portions, Chanonry and Rosemarkie, were constituted a royal burgh in 1590. The seat of a Columban monastery in the 6th century, of the bishopric of Ross from 1124, it retains the south aisle and chapter-house of a fine cathedral, demolished by Cromwell to furnish materials for his fort at Inverness. There are capital links, good bathing, and a new steamboat pier. Pop. (1851) 1148; (1881) 874.

**Fort Royal**. See FORT DE FRANCE.

**Fort Scott**, capital of Bourbon county, Kansas, on the Marmiton River, 98 miles S. of Kansas city. A railway junction, it has foundries, machine-shops, flouring and woollen mills, and an extensive trade in bituminous coal. Pop. 7867.

**Fort St David**, a ruined fortress on the coast of Madras presidency, 100 miles S. of Madras, on the outskirts of Cuddalore. It became British in 1690, along with all the land round about to the distance of a 'random shot,' and was an important place during the struggle with the French, forming the chief of the English settlements on the Coromandel coast from 1746 to 1762. It is of interest also from associations with Clive (q. v.), who became governor in 1766.

**Fort St George**. See MADRAS.

**Fort Sumter**. See SUMTER.

**Fortuna**, called by the Greeks *Tyche*, was in classical mythology the goddess of Chance. According to Hesiod, she was a daughter of Oceanus; according to Pindar, a sister of the Parca. She differed from Destiny or Fate in so far that she worked without law, giving or taking away at her own good pleasure, and dispensing joy or sorrow indifferently. She had temples at Smyrna, Corinth,

and Elis. In Italy she was extensively worshipped from a very early period, and had many titles, such as *Pubrica*, *Plebeia*, *Equestris*, *Virilis*, *Primgenia*, *Publica*, *Privata*, *Muliebris*, *Virginensis*, &c., indicating the extent and also the minuteness of her superintendence. Particular honours were paid to her at Antium and Praeneste; in the temple of the former city two statues of her were even consulted as oracles. Greek poets and sculptors generally represented her with a ladder, as a symbol of her guiding power; or with a ball, or wheel, or wings, as a symbol of her immutability. The Romans proudly affirmed that when she entered their city she threw away her globe, and put off her wings and shoes, to indicate that she meant to dwell with them for ever. See Drescher's exhaustive article in part ix. (1886) of Roscher's *Lexicon der Mythologie*.

**Fortunate Islands**. See CANARIES.

**Fortunatus** is the title of one of the best people's books (*Volkshucher*) ever written. It originated about the end of the 15th century, though many of the tales and legends included in it are of much older date. The opinion that it was worked up into German from a Spanish or English original may safely be set aside. The substance of the book is that Fortunatus and his sons after him are the possessors of an inexhaustible mine of gold and a wishing-cap, which however, in the end, prove the cause of their ruin. The moral is that worldly prosperity alone is insufficient to produce lasting happiness. The oldest printed edition of the book now extant bears the date 1509. Later German editions mostly bear the title, *Fortunatus, von seinem Sackel und Wunsch-kutlein*. It has been reprinted in the third volume (1846) of Simrock's *Deutsche Volksbücher*. Versions of the story have appeared in French, Italian, Dutch, Danish, Swedish, and even Icelandic. The first to dramatise the subject was Hans Sachs, in *Der Fortunatus mit dem Wunsch-sackel* (1553), after whom comes the English Thomas Dekker, with his *Pleasant Comedie of Old Fortunatus* (1600), a work which had the honour to make its reappearance in German about the year 1620. The most poetical edition of the story is that given by Tieck in his *Phantasus*. See Schmidt, in Ersch and Gruber's *Encyclopädie* (sect. 1, vol. xlv.).

**Fortune**, ROBERT, a botanist and traveller in China, was born in the county of Berwick in 1813. After serving an apprenticeship as a gardener, he obtained employment in the Royal Botanic Garden at Edinburgh, and afterwards in the gardens at Chiswick. His real life-work began, however, in 1843, with the first of his journeys to China, on behalf of the Botanical Society of London. The results of this journey, the fruits of his observation of the flora of the country, its tea and cotton culture, appeared in 1847 in *Three Years' Wanderings in Northern China*. He subsequently visited China on three separate occasions, to study the methods of tea-cultivation, to carry plants from that country to India, and to collect seeds and plants for the government of the United States. *Peking and Peking* (1863) was written after his fifth and last journey to the East. His other two books are *A Journey to the Tea Countries of China* (1852), and *A Residence among the Chinese* (1857). Fortune was for a few years director of the Botanical Gardens at Chelsea. He died 16th April 1880.

**Fortune-telling**. See PALMISTRY, VAGRANT ART.

**Fortuny y Carbo**, MARIANO, an eminent Spanish painter, was born at Reus in Tarragona, in 1839, and studied in the Academy of Barcelona and in Italy. When Spain declared war against the sultan of Morocco, Fortuny followed the army

to Africa, and filled his portfolios with studies of Eastern life. He received a commission for his 'Battle of Tetuan,' which now hangs in the Chamber of Deputies, Barcelona; but the subject was little to his taste; and, disputes having arisen, this large work was never quite completed. It was the domestic and ceremonial aspects of Eastern life that Fortuny chose to portray, and these mainly for their purely artistic possibilities; the painter treating his subjects simply as colour-schemes made up of dusky countenances, and gorgeous draperies, and vivid sunlight. His touch was particularly incisive and dexterous, and the effects he aimed at were those depending on the sparkle and brilliancy of points of potent, infinitely varied colour. He afterwards stayed much in Paris, Granada, and in Madrid, where he studied the great Spanish masters, and married the daughter of Madrazo, the director of the Academy. The preliminaries of his own wedding suggested to the painter his celebrated picture of 'The Spanish Marriage,' and among other of his later works are his 'Book-lover in the Library of Richelieu' and 'Academicians choosing a Model.' He also left some etchings of Eastern subjects. He died at Rome, 21st November 1874. See monographs by Davillier (illus. Paris, 1875) and Yriarte (Paris, 1885).

**Fort Wayne**, capital of Allen county, Indiana, at the confluence of the St Joseph and St Mary's rivers, which form the Maumee, and on the Wabash and Erie Canal, 148 miles ESE. of Chicago. It is an important railway centre, and has several railway workshops, foundries, and manufactures of organs, woollens, and engines. It is the seat of a Catholic bishop, and contains a Catholic hospital, convent, and academies, besides Methodist (1846) and Lutheran (1850) colleges. Pop. (1870) 17,718; (1880) 26,850.

**Fort William**, a police-borough of Inverness-shire, near the head of salt-water Loch Linne, the west base of Ben Nevis, and the south end of the Caledonian Canal, 66 miles SSW. of Inverness. A fort, built here by Monk in 1655, and rebuilt in 1690, was vainly besieged by the Jacobites in 1746, and about 1860 was dismantled. Fort William, long one of the keys of the Highlands, is now a great centre for tourists. Its four churches are all modern, built between 1868 and 1889. Here was erected in 1880 a meteorological observatory near sea-level, in connection with the high-level station on the summit of Ben Nevis. The fort made way in 1890 for the railway station of a line from Glasgow. Pop. (1841) 1026; (1881) 1594; (1891) 1856.

**Fort William** (INDIA). See CALCUTTA.

**Fort Worth**, capital of Tarrant county, Texas, on the west fork of the Trinity River, 33 miles W. of Dallas by rail, with several mills, and a trade in cotton. Pop. 6663.

**Forty**. This number seems to have been, time out of mind, regarded with superstitious veneration alike by Jews and Moslems, since it prominently figures in the Bible and in Mohammedan writings. To cite some interesting examples from the notes to Mr W. A. Clouston's *Group of Eastern Romances and Stories* (privately printed, 1889): The Flood continued 40 days (Gen. vii. 17); Isaac was 40 years old when he took Rebekah to wife (Gen. xxv. 20), and Esau was of the same age when he wedded the two Hittite damsels (Gen. xxvi. 34); Joseph and his kinsmen fasted 40 days for their father Jacob (Gen. l. 3); thrice Moses fasted 40 days (Exod. xxiv. 18, xxxiv. 28; and Deut. ix. 9-25); during 40 days the Hebrew spies searched Canaan (Numb. xiii. 25); the Israelites were condemned to wander in the wilderness 40 years (Numb. xiv. 33); Eli judged Israel 40 years (1 Sam. iv. 18); Goliath defied the

Hebrew army 40 days (1 Sam. xvii. 16); David and Solomon each reigned 40 years (2 Sam. v. 4; 1 Kings, ii. 11, xi. 42); Elijah fasted 40 days (1 Kings, xix. 8); Nineveh was to be destroyed after 40 days (Jonah, iii. 4); Ezekiel bore the iniquities of the house of Judah 40 days, a day for a year (Ezek. iv. 6); Christ was tempted by Satan in the wilderness after having fasted 40 days (Matt. iv. 2, and Mark, i. 13), and continued 40 days on earth after his resurrection (Acts, i. 3). For further biblical instances, see Exod. xxvi. 19; Josh. xiv. 7; Judges, iii. 11, viii. 28, xiii. 1; 2 Sam. xv. 7; 1 Kings, vi. 17, vii. 38; 2 Kings, viii. 9; Ezek. xxix. 11, 12; Acts, xiii. 21; 2 Cor. xi. 24.

Moslems mourn 40 days for their dead, and they deem a woman ceremoniously unclean during 40 days after childbirth; among the Israelites the period was 40 days when she had given birth to a male child, and twice 40 in the case of a female child. In Moslem fictions the number 40 very frequently occurs; for instance, in the well-known Arabian 'Tale of the Third Calender,' his voyage is prosperous for 40 days; he is entertained by 40 fairy damsels who absented themselves for 40 days. In the ever-fresh tale of 'Aladdin and his Lamp,' when the magic palace has disappeared the sultan allows him 40 days to find it and the fair princess. In the Persian romance of *Nasir*, the hero is directed by the 'last will' of a pious hermit, whom he found dead in his cell, to spend 40 days in prayer for the restoration of the fairies' fountain; he shoots an arrow through a suspended finger-ring 40 times in succession; but his too expert archery caused an accident to the king, from which his majesty did not recover until he had been 40 days under medical treatment. In a subordinate story in the same romance poor Shah Mansur was in the power of a cruel sorceress for nearly 40 days; and in another interwoven story a young prince was tossed about in the sea in a boat for 40 days. The general number of a gang of robbers in Eastern tales is 40: we have a very familiar instance of this in the Arabian tale of 'Ali Baba and the Forty Thieves,' and another example is afforded us in the story of 'Ahmed the Cobbler' (Malcolm's *Sketches of Persia*), where the king's treasury is plundered by 40 robbers.

In Wales 40 loaves of bread and 40 dishes of butter are a common quantity in the records of rent paid to the Bishop of Llandaff. The fee of a bard for his song was 40 pence when he was a disciple, and twice forty for a master. The unthrifty 'Heir of Linne,' according to the fine old ballad, tried to borrow 40 pence of John o' the Scales, who had become the owner of his lands. A ship suspected of being infected with cholera, yellow fever, &c., is placed under *quarantine*—prohibited from landing passengers and discharging cargo for 40 days.

**Forty-shilling Freeholder**. See PARLIAMENT, FREEHOLD.

**Forum**, the name applied by the Romans to a public space, especially the market-place in a city, as the principal place of meeting where public affairs were discussed, courts of justice held, and money transactions carried on. In Rome the name applied particularly to the famous *forum* or *forum magnum*, the low level space extending from the foot of the Capitoline Hill to the north-east part of the Palatine. Unlike the *fora* of the emperors this was a slow growth, and was only possible after the valley had been drained by the great *cloaca*. The central space was the meeting-place of the plebs, *Comitia Tributa*; while the patricians, *Comitia Centuriata*, met on the Comitium, adjoining the Forum. See ROME.

**Forum Competens**, in Law, is the court to the jurisdiction of which the party is amenable.

**Fos'cari**, FRANCESCO, Doge of Venice during the most flourishing period of the Venetian power. Born about 1370, and elected doge in 1423, his ambition speedily involved the state in a conflict with Milan, which, however, in consequence of the doge's great military ability resulted in the aggrandisement of Venice by the Treaty of Ferrara (1433). The last years of the doge were embittered by the misfortunes that overtook his son, Giacopo, who was, by authority of the Council, three times tortured in his father's presence and banished, on the first two occasions on false charges, on the third occasion for having besought foreign intercession against the injustice to which he was being subjected. Giacopo died in Candia shortly after his last cruel torturing and banishment. The old doge was allowed to resign office in 1457, and died seven days later, on 1st November. Byron made the tragic history of father and son the subject of *The Two Foscari*.

**Fos'colo**, UGO, originally NICCOLÒ, an Italian author, was born in Zante, one of the Ionian isles, on 26th January 1778. His education was begun at Spalato, and completed at Padua, where Cesarotti inspired him with his first love for literature. A man of passionate temperament, and without an ardent patriot, Foscolo was bitterly disappointed when by the Treaty of Campo Formio Venice was given to Austria, and his disappointment found vent in the *Lettere di Jacopo Ortis* (1802), a sort of political Weither. Still, believing that France was destined to liberate Italy, he served in the French armies, and was present at the battle of the Trebbia and the siege of Genoa. But, becoming finally undeceived as to Napoleon's intentions with regard to his native land, he returned to Milan, where he published in 1807 his best poem, *I Sepolcri*, a work composed in the spirit of the ancient classic writers, and remarkable for its smooth and polished versification. About this time he wrote a translation of Sterne's *Sentimental Journey*, and two tragedies, *Ajace* and *Ricciarda*, both showing political tendencies. In 1809 he was appointed to the chair of Eloquence in Pavia, and occupied the post until the professorship was suppressed in all the colleges of Italy. His inaugural address, *Dell' Origine e dell' Ufficio della Letteratura*, although full of the same love of classic beauty which marks the *Sepolcri*, is turgid and affected in style, like the man himself. When in 1814 the Austrians entered Milan, Foscolo withdrew to Switzerland, and in 1816 he went on to London. There some of his best writings were published—viz. *Essays on Petrarca*, *Discorso sul testo del Decamerone*, *Discorso sul testo di Dante*, and various papers in the *Quarterly* and *Edinburgh Reviews*. His last years were embittered by poverty and neglect. He died October 10, 1827, of dropsy, near London. His remains were finally deposited in the church of Santa Croce, Florence, in 1871. His works and letters were published at Florence in 12 vols. by Le Monnier (1860-62). See LIVES by Pecchio (1836), Carrer (1842), Artusi (1878), Antonia Traversi (1884), and De Winckels (2 vols. 1885-86).

**Foss**, or **FOSSH** (Lat. *fossa*, from *fodio*, 'I dig'), in Fortification, is a ditch or moat, either with or without water, the excavation of which has contributed material for the walls of the fort it is designed to protect. The foss is immediately without the wall, and offers a serious obstacle to ascending the defences. See FORTIFICATION.

**Fossa et Furca**. See PIT AND GALLOWES.

**Fossano**, a town of Piedmont, North Italy, picturesquely situated on a hill over the Stura, 15 miles NE. of Cuneo by rail, with a cathedral, a 14th-century castle, and remains of the old town walls. Its streets have an antique and gloomy

appearance, the houses being built over low arcades, under which run the footways. It has an academy of sciences, a seminary, technical and veterinary schools, and manufactures of silk, leather, and hemp. Pop. 7959. See BORGOGNONE.

**Fossil** (Lat. *fossilis*, 'dug out of the earth'), a term formerly applied, in accordance with its derivation, to whatever was dug out of the earth, whether mineral or organic. The term is now restricted to remains and relics of plants and animals which have become embedded by natural causes. These fossils may consist of the harder and more durable parts of animals and plants, or they may be merely the casts or impressions of such remains, or the footmarks or tracks which animals may have left behind them on some soft surface which has been subsequently covered up and consolidated. They occur in nearly all the stratified aqueous rocks, which have on this account been called fossiliferous strata. It is difficult or impossible to detect them in metamorphic aqueous rocks, for the changes that altered the matrix have also affected the organisms, so as either almost or altogether to obliterate them. In the archæan schists they have escaped notice, if ever they existed; but recently they have been detected in schistose rocks of Silurian age in southern Norway.

The conditions in which fossils occur are very various. In some Pleistocene beds the organic remains are but slightly altered, and are spoken of as sub-fossil. In this state are the shells in some raised sea-beaches, and the remains of the huge struthious birds of New Zealand, which still retain a large portion of the animal basis. In the progress of fossilisation every trace of animal substance disappears; and if we find the body at this stage, without being affected by any other change, it is fragile and friable, like some of the shells in the London clay. Most frequently, however, a petrifying infiltration occupies the cavities left in the fossil by the disappearance of the animal matter, and it then becomes hardened and solidified; hence fossils were formerly, and still often are, called *petrifications*. Sometimes the whole organism is dissolved and carried off by water percolating the rock, thus leaving a cavity which may be filled up with calcite, pyrite, gypsum, flint, chalcedony, or some other mineral; and we thus obtain the form of the organism, with the markings of the outer surface, but not exhibiting the internal structure. Not infrequently, as in the case of shells of molluscs, &c., after the soft parts of the organism have been removed and replaced by inorganic matter (either before or after burial), the shell itself may be dissolved out so as to leave a cavity which shows the mould of the outer surface of the shell, and a cast of the interior. If the shell-space is not subsequently filled up by introduced mineral matter, the internal cast lies loose in the cavity like the kernel of a nut. Most commonly, however, the shell itself is replaced by hydrated mineral matter. The most advanced and perfect condition of fossilisation is that in which not only the external form, but also the most minute and complicated internal organisation, is retained; in which the organism loses the whole of its constituents, particle by particle, and as each molecule is removed its place is taken by a molecule of another substance, as silica or pyrites. In this way we find calcareous corals perfectly preserved in flint, and trees exhibiting in their silicified or calcified stems all the details of their microscopic structure—the cells, spiral vessels, or disc-bearing tissue, as well as the medullary rays and rings of growth.

**FOSSIL FERNS**. As far as has been yet determined from the rocky tablets of the earth's crust, ferns first appeared in the Devonian period, and these comprised both herbaceous and arborescent species.

In the immediately succeeding Coal-period they appear to have reached their maximum development. The dense forests and the moist atmosphere of this period were so suited to their growth that they formed a large bulk of the vegetation. Several hundred species have been described, some of them tree-ferns of a size fitting them to be the companions of the immense *Sigillarias* and *Lepidodendrons* whose remains are found associated with theirs in the Carboniferous rocks. In the Permian rocks comparatively few ferns have been met with, but these rocks are as a whole not rich in organic remains. Numerous new forms appear in the Trias, and their number is increased in the Jurassic. The Cretaceous strata being chiefly of marine origin, land-plants are not abundantly met with. But the evidence supplied by the Wealden beds of England and strata on the same geological horizon in Germany shows that ferns were at that time prominent forms in the vegetable life of the globe. In the Tertiary strata ferns are rather rare.

FOSSIL FORESTS have been frequently observed in the Coal-measures. The seams of coal having in general been formed from the vegetation of the locality where they occur, it is to be expected that when the coal is removed the stools and roots of the trees will be observed in the immediately

Ground-plan of the  
Fossil Forest at Parkfield  
Colliery.

subjacent bed of clay or shale—the ancient soil. Such a forest was laid bare in an open work at Parkfield Colliery, near Wolverhampton, in 1844. In the space of about one-fourth of an acre the stumps of 73 trees, with their roots attached, appeared as shown in the annexed ground-plan. The trunks, broken off close to the root, were lying prostrate in every direction, often crossing

each other. One of them measured 15, another 30 feet in length, but they were generally shorter. They were invariably converted into coal, and flattened to the thickness of 1 or 2 inches. The upright stems show that some of them had a circumference of more than 8 feet. A fossil forest was uncovered near Glasgow in 1887. Similar fossil forests have been observed in the coalfields of Nova Scotia, and have been carefully described by Lyell, Logan, and Dawson. The usual height of the trees observed by Lyell was from 6 to 8 feet; but one tree was about 25 feet high, and 4 feet in diameter. Brongniart describes the remains of a fossil forest preserved in an upright position, in strata of micaceous sandstone, belonging to the Coal-measures at St Etienne, near Lyons. Though most abundant in strata of the Carboniferous period, fossil forests have been observed in other formations. The Dirt-bed (q.v.) of the Lower Purbeck series is the remains of an ancient forest. Instances are also abundant in strata of later age.

The remains of ancient forests belonging to a geologically recent period are to be found in and underneath beds of peat. There is good evidence that some kinds of peat had their origin in the destruction of forests. Trunks and branches of oak, hazel, fir, &c. are found in them, and the roots of the trees may be traced in the underlay. Round the coasts of the British Islands and the opposite shores of the Continent remains of ancient forests are frequently to be seen at low-water, the stools of the trees evidently occupying the place of growth. The occurrence of these so-called 'submerged forests' shows that within recent times

there has been a loss of land in north-western Europe. See GEOLOGY, PALEONTOLOGY, PLEISTOCENE SYSTEM, &c. The discussion of fossil footprints, the tracks of animals or other moving things, on mud or sand now indurated into rock, is sometimes called Ichthyology.

**Fossombrone**, a town in the Italian province of Urbino-Pesaro, on the Metauro, which is here spanned by a fine modern bridge, 10 miles E. of Urbino, with a cathedral, mineral spring, and manufactures of silk. Here stood the ancient *Forum Sempronii*, of which interesting remains have been found. Pop. 4266.

**Foster**, BIRKET, artist, was born at North Shields, of Quaker parentage, 4th February 1825, but from his sixth year was brought up in London. He could draw before he could speak, and, as pupil to Landells, the wood-engraver, from 1841 to 1846, he produced a large number of subjects for wood-engravings, the earliest for Mr and Mrs S. C. Hall's *Ireland* (1843), and many for the *Illustrated London News*. Afterwards, in conjunction with John Gilbert, he illustrated *Evangeline* and many of the poets, his share being dainty poetic land-scapes and rustic scenes, nowhere better exemplified than in his *Pictures of English Landscape* (1862). Between them the two did more than any others to educate popular taste. In 1839 Foster exhibited the first of many water-colours, and in 1860 was elected an associate, in 1861 a member of the Water-colour Society. See Walford's *Representative Men* (1867), and Huish in *Art Journal Supplement* (1890).

**Foster**, JOHN, 'the essayist,' was born in the parish of Halifax, Yorkshire, 17th September 1770. Elder son of a yeoman-weaver, he was trained for the ministry at Brierly Hall and the Baptist College in Bristol, but, after preaching for twenty-five years with very indifferent success to small congregations at Newcastle, Dublin, Chichester, Frome, &c., in 1817 he finally relinquished the pastoral office, to devote himself wholly to literature. His *Essays, in a series of Letters* (1805), were only four in number—the best known that 'On Decision of Character'—yet they showed him, said Mackintosh, 'to be one of the most profound and eloquent writers that England has produced.' In 1808 Foster married the Miss Maria Snooke to whom they were originally addressed. In 1819 appeared his celebrated *Essay on the Evils of Popular Ignorance*, in which he urged the necessity of a national system of education. Between 1806 and 1839 he contributed 184 articles to the *Eclectic Review*, 50 of which were edited by Dr Price in 1844. He died 15th October 1843, at Stapleton, Bristol, his home for twenty-two years. Foster was a man of deep but sombre piety. The shadows that clouded his spirit were due, however, to an inborn melancholy; they had nothing of bigotry or fanaticism. His thinking is massive and original; and at times, when his great imagination rouses itself from sleep, a splendour of illustration breaks over his pages that startles the reader by its beauty and suggestiveness. See his *Life and Correspondence*, by J. E. Ryland (2 vols. 1846; reprinted in Bohn's Standard Library, 1852).

**Foster**, STEPHEN COLLINS, an American songwriter, was born in 1826 in Pittsburgh, Pennsylvania, and was a merchant's clerk in Cincinnati when, in 1842, the success of his first song determined his profession. His compositions, many of them enormously popular, number about 125; nearly a fourth are negro melodies, the remainder chiefly sentimental ballads. The best known are 'The Old Folks at Home,' 'Nelly Bly,' 'Uncle Ned,' 'Old Dog Tray,' 'Gentle Annie,' 'Old Kentucky Home,' 'Willie, we have missed you,' and 'Come where my Love lies dreaming,' the airs and words of

which alike were his own composition. He died in New York, 13th January 1864.

**Fosterage**, the relation which arises when children are nursed and brought up by others than their own parents, may anywhere establish a very close bond between foster-parents and foster-children. But in ancient Ireland, under the Brehon Laws (q.v.), the systematic fosterage of the children of the wealthy in poor families, and their education there from infancy till the age of thirteen in the case of daughters and seventeen in the case of sons, was recognised and organised in the most elaborate manner, the respective duties and privileges being carefully specified and guarded. Thus, the foster-parents were entitled not merely to the fosterage fee, but to support in their old age from the foster-child; the foster-father was liable to mulcts incurred by the foster-child; and, if the foster-child was found to have been improperly or imperfectly educated in any of the specified branches, the foster-father had to refund the fees in due proportion.

**Fotheringhay**, a village of England, in Northamptonshire, on the river Nen, 9 miles S.W. of Peterborough. Pop. 225. In the ancient castle of Fotheringhay, founded shortly after the Conquest, Mary, Queen of Scots, was beheaded in 1587. It was allowed to fall into decay after the accession of James I. to the throne of England.

**Foucault**, JEAN BERNARD LÉON, French physicist, was born in Paris, 18th September 1819. His first work in the physical sciences was the improvement of Daguerre's photographic processes, and his next a series of investigations, conducted in co-operation with Fizeau, on the properties of light. Continuing his optical inquiries, he was enabled to demonstrate in 1850 that the velocity of light is greater in air than in water, and that in different media the velocity varies inversely as the refractive indices of the respective media. For his remarkable proof in 1851 of the rotation of the earth by means of a freely-suspended pendulum, see PENDULUM. Two years after his appointment (1855) as physical assistant in the observatory at Paris Foucault invented his polariser; and two years later (1859) his reflector for the great telescope at Paris was completed. Foucault also invented apparatus for the better application of the electric light, and showed that the sun may be viewed without injury to the eyesight if the object-glass of a large telescope be covered with a thin film of silver. He died at Paris on 11th February 1868. Foucault edited the scientific part of the *Journal des Débats* from 1845, and was elected a foreign member of the Royal Society of London in 1864. His papers were printed in *Comptes Rendus* (1847-69). Compare also *Recueil des Travaux Scientifiques de Foucault* (ed. by Gariel and Bertrand, 1878).

**Fouché**, JOSEPH, Duke of Otranto, minister of Police under Napoleon, was born at Nantes, 29th May 1763. Although educated for the church, he hailed the Revolution with extravagant delight; and, on being elected to the National Convention in 1792, attached himself to the extreme party of the Mountain, and voted for the execution of Louis. He was commissioned by the Committee of Public Safety to castigate the obdurate city of Lyons (1794), and in that business rivalled his associates, Collot d'Herbois and Conthon, in cruelty and bloodthirstiness. In 1794 he was expelled from the National Convention as a dangerous Terrorist. Yet in September 1799 he had so far recovered ground that he was appointed minister of Police, a post which he held, though with several interruptions, down to 1815. Having made himself indispensable to Napoleon, whom he materially assisted during the revolution of 18th

Brumaire (5th November 1799), he proceeded to organise a system of police espionage; but this soon grew intolerable to the First Consul, who in 1802 abolished the ministry. In compensation Fouché was nominated senator of Aix, and rewarded with a large sum of money. Yet two years later Napoleon found it necessary to reinstate him in the office. Once more dismissed by the emperor in 1810, Fouché, after a period of flight in Tuscany, received the appointment of governor-general of Ljubach and Rome (1813), and then of ambassador at Naples. Once more he was restored to his former post by Napoleon after his return from Elba, but seeing the downfall of the latter to be inevitable, he made terms with the Bourbons. Under Louis XVIII. he retained his position until the king was constrained by the popular voice to dismiss him in September 1815. Appointed ambassador to Dresden, he was there struck in 1816 by the decree of banishment pronounced against the excothens of Louis XVI.; and henceforward he led an exile's life at Prague, Linz, and Trieste, where he died, 25th December 1820. Fouché was a man with one aim only, his own political success. Unscrupulous, yet politic and sagacious, crafty, and fond of intrigue, he made an admirable head of police in the troublous days of Napoleon's reign, and by the firmness and skill which he displayed in the internal government of France, which was left almost entirely in his hands during the emperor's absence on his many campaigns, he was largely instrumental in preserving his country from anarchy. The *Mémoires de J. Fouché*, published in 4 vols. at Paris in 1828-29, have been declared not genuine by his sons. Nevertheless Fouché is known to have composed *mémoires* during his last years of banishment.

**Fougasse**, in military science, an explosive mine so arranged as to hurl a volume of stones in the faces of an attacking force.

**Fougères**, a town in the French department of Ille-et-Vilaine, 23 miles by rail N. of Vitré (on the main line from Paris to Brest). It has a picturesque old castle, a college, and considerable manufactures of bootmakers' materials, sailcloth, and leather, besides granite-quarries. Here the Vendean royalists defeated the republicans in November 1793. Pop. (1872) 10,599; (1886) 15,133.

**Foula**, a lonely island of Shetland, 16 miles W.S.W. of the nearest point of the mainland. Measuring  $3\frac{1}{2}$  by  $2\frac{1}{2}$  miles, it is 5 sq. m. in area, and attains in the Snaeg a maximum altitude of 1372 feet. Foula is chiefly remarkable for the Old Red Sandstone cliffs on its north-west side, which, rising almost sheer from the sea to a height of 1220 feet, are unmatched for grandeur in the British Isles. They are denized in the breeding season by myriads of sea-fowl—pullins, kittiwakes, and the rare great skua or 'bonxie' (*Lestris carinatus*), which formerly was preserved by the islanders to keep down the eagles. The only landing-place is at the fishing hamlet of Ham, on the south-east. Foula was the last island where the old Norse tongue lingered on into the 19th century. It has Congregational and Established chapels. Pop. (1861) 233; (1881) 267. See Tuder's *Orkneys and Shetlands* (1883).

**Foulais**. See FULAIS.

**Fould**, ACHILLE, French financier and politician, was born in Paris, 31st October 1800, of Jewish parents. Early in life he was initiated into financial business in his father's bank. His political career began in 1842 by his election to the Chamber of Deputies for the Basses-Alpes. After the revolution of 1848 Fould accepted the new régime of the republic, and rendered considerable service to the provisional government in its financial

affairs. During the presidency of Louis Napoleon he was four times minister of Finance between 1849 and 1852. Whilst in office Fould gave the first impulse to the foundation of the *Credit Mobilier*. Early in 1852 he finally resigned, in consequence of the confiscation of the property of the Orleans family. The same day, however, he was created a senator, and shortly afterwards returned to power as minister of state and of the imperial household, which position he held until 1860. In 1861 he was reappointed finance minister, and retained that post until 1867. On the 5th October following he died at Tarbes.

**Foulds**, ROBERT and ANDREW, Glasgow printers, were born the one in 1707, the other in 1712. Robert for some years practised as a barber, but meanwhile attended Professor Hutcheson's lectures on moral philosophy. Andrew had been bred for the ministry. In 1741, after two tours with his brother in England and France, Robert set up as a Glasgow bookseller, in 1743 was appointed printer to the university, and between 1742 and his death published 534 works—classics, translations, poetry, plays, &c. The most celebrated are the 'immaculate' *Horace* (1744), which contains, however, six misprints, and the splendid folio *Homer* (4 vols. 1756-58). With the view of promoting the fine arts in Scotland, Robert, after a fourth visit to the Continent, established in 1753—fifteen years before the foundation of the Royal Academy—an academy at Glasgow for engraving, moulding, modelling, and drawing. During the first ten years of its existence this institution produced 1112 prints, besides statues, busts, oil-paintings, and crayons; David Allan owed to his early training. But the heavy attendant expense led to the decline of the printing business, and the death of the quiet, unwearying Andrew on 18th September 1775 proved the finishing blow. Eight months later Robert sold off his collection of 'old masters' at Christie's in Pall Mall; when all costs were defrayed the balance in his favour was just fifteen shillings. He died suddenly in Edinburgh, on his way back to Glasgow, 2d June 1776. For a full account of this *par nobile fratrum*, the 'Scottish Elzevirs,' see Richard Duncan's *Literary History of Glasgow* (Maitland Club, 1831; new ed. 1886).

**Foundation.** By this term is generally meant the ground on which the walls of a building rest. But of the walls themselves, whether of brick or stone, the lower courses, or those under the surface of the ground, are called foundation courses. The first thing to determine regarding the site for a building is whether the ground is natural or artificial. By the latter is understood some deposit of waste material, such as loose earth or builder's rubbish, which has been used to level up a piece of ground or put down for some other purpose. It is always necessary to sink the foundation trenches or tracks through made-up ground till the natural surface is reached. Supposing that on the site chosen there are no springs of water, and that it is well drained, then there is a likelihood that whatever the natural foundation, whether of rock, clay, sand, or gravel, it will be a safe one. Sometimes, however, even with these, some means has to be taken to prevent unequal yielding under the pressure of the walls. There may, for example, be hard and soft parts on a piece of ground of the same general character.

In the case of compressible soils of whatever nature the walls require a sufficiently thick bed of Concrete (q.v.) underneath them. More rarely Piles (q.v.) are driven in to support a platform upon which the walls rest, and sometimes inverted arches are used for distributing pressure over a foundation where it would otherwise come only on a few points.

Except where a building is erected on solid rock, what are called 'footings,' or, in Scotland, 'scaucements,' form the first or foundation courses of the walls. Stone footings consist of large flat-headed stones, which in the lowest course are generally twice as broad as the wall above is thick. Two or more of these projecting courses are first laid, which give a stepped section to those portions of the walls underground. Brick footings resemble those of stone, only in them there are, of course, more joints from the smaller size of bricks. For foundations under water, see CAISSON, COFFER-DAM.

**Foundations.** See CHARITY COMMISSIONERS, CORPORATION.

**Founder**, also called LAMINITIS, consists of inflammation of the vascular sensitive laminae of the horse's foot. It is also met with in cattle, but rarely in sheep, the corresponding structures being in them less developed. Occasionally the laminae are strained from severe exertion; more frequently they suffer from the morbid effects of cold, which is especially injurious after excitement and over-fatigue. Very commonly also they become inflamed from their close sympathy with diseases of the digestive organs, often following engorgement of the stomach or bowels. All the feet are sometimes affected, more usually the fore-feet only. They are hot and tender; the animal stands as much as possible upon his heels; trembles and groans when moved; and is in a state of acute fever and pain. Except when following super-purgation or internal disease, bleeding is useful. The shoes must at once be removed, and the toes, if long, reduced, but no further rasping or cutting is permissible. The feet must be enveloped in hot bran poultices, and kept off the hard ground by a plentiful supply of short litter. Soap and water clysters, repeated if necessary every hour, usually suffice to open the bowels, which are very irritable; and physic, if required, must therefore be used with extreme caution. Two drachms of aloes is an ample dose in founder. Have the strain taken off the inflamed laminae by getting the animal if possible to lie down, or, if he be afraid to do so, let him be 'cast' and kept down. As a rule when once down he will, from the relief to pain, often remain in the recumbent position; he should then be turned twice a day, and his bedding kept dry and clean to prevent chafing of the skin or 'bed-sores.' After the acute symptoms pass, thin healed shoes, bared or plain, as suit the feet, should be put on; cold applications should be made to the feet, and afterwards a mild blister put round the coronet.

**Founding**, or METAL-CASTING, is the art of working metals by pouring them, while in a fluid condition, into moulds in which they solidify and harden into the form of the mould which they fill. In general the terms are restricted to metal-work; but glass, plaster, cement, wax, gutta-percha, &c. are cast in moulds precisely in the same manner as the metals.

Casting is the most important of all the operations by which metals are fashioned into useful or ornamental forms; but there are certain metals which cannot be in practice treated by this process. It is essential that the metal employed should be malleable at a temperature which can be reached in foundry practice, that it should flow freely, and should fill the mould well without forming air-bubbles in the mass. Malleable iron cannot be treated by casting, on account of the excessive temperature at which it becomes fluid; and neither copper nor aluminium become sufficiently limpid to flow and fill a mould properly. Iron-founding, in which the special form of pig-iron known as 'foundry pig' is used, is the greatest of metal-

casting industries; after which come brass-founding, bronze-casting, zinc, German silver, gold and silver casting, and typefounding and stereotyping. The last two will be dealt with under their own proper heads, and the casting of the minor metals will receive such notice as they require in connection with the metals themselves.

The general process of founding or casting embraces numerous and complex operations connected with (1) the preparation of a mould or form into which the molten metal is run, (2) the melting of the metal or alloy, and (3) the pouring of the molten metal into the mould, in which it solidifies and hardens. According to the form, size, and intricacy of the object to be cast, and the nature and value of the metal used, the variations of working are very many, and it will not be possible here to describe more than two or three typical processes.

*Bronze-casting* is the most ancient of all metallurgical arts, and an outline of its development may serve to illustrate the processes employed in dealing with that alloy. The earlier forms of bronze axe used by prehistoric man were solid castings made in moulds, which consisted of two flat stones, having in the faces of each hollowed-out depressions which corresponded to two equal halves of the axe. The stones, when placed accurately face to face, had thus between them a hollow space which represented the form of a perfect axe, and into that hollow from the outer surface a channel or 'gate' was formed, by which the molten metal was poured in, till the hollow or mould was filled up. In later times, with the view of saving valuable metal, the practice was introduced of forming a core within moulds of large objects, around which the bronze was poured, which thus formed only an outer surface or skin. Iron appears to have been the material at first selected as suitable for such cores. But at a very early period the Greek sculptors discovered the art of casting their figures, &c. so that the core around which the metal flowed was removable, thus forming hollow castings. By whatever process the early artists worked they were able to produce castings which for beauty of surface, intricacy of pattern, size of casting, and economy of metal cannot be excelled with all the resources of modern ingenuity. Their process was probably that employed to the present day for the finest products of bronze-casting, known as *cire perdue*. In this process a rough model of the statue or other object to be cast is formed slightly smaller than the work to be cast. This model is coated over with beeswax; and to the wax surface the most finished form and touches of the artist are given. The whole surface then receives two or three coatings of a potter's slip or fine cream of ground brick, clay, and ashes, which forms a closely adherent skin around the wax. Then the mould is built up of clay, packed around all the parts to form a solid mass, which is clamped up within a strong iron framework. At certain intervals iron pins are stuck through the clay and wax into the central core, and suitable 'gates' are made for pouring in the bronze and allowing the wax to escape. The clamped-up mass is now placed in the furnace, and slowly heated up till all the wax runs out, and the clay of both mould and core are dried and sufficiently baked. The space at first occupied by the wax is now vacant, and it only remains to pour in molten bronze to occupy the space and assume the form and the thickness of the original wax. In modern bronze-casting for which the *cire perdue* process is not employed, objects of large size, such as heroic figures, are cast in sections, which have afterwards to be fused together at their edges. Models in plaster of the

separate pieces are first made, from which moulds in sand and plaster are obtained. Within these moulds cores are cast, and these when baked and dry are uniformly scraped down all over according to the thickness desired in the finished object. The cores so reduced are again placed and supported within the moulds, and thus there is a space between mould and core into which the molten bronze is poured. The various pieces are subsequently brazed together and finished. Some of the recorded works of early Greek sculptors were cast of gigantic proportions. The Colossus of Rhodes is variously stated at from 90 to 120 feet in height. There yet remains in the Hippodrome at Constantinople a pillar of bronze in the form of three twisted serpents, cast 479 B.C., which in its perfect condition was 20 feet high. Selwanthaler's figure of 'Bavaria' in Munich, finished in 1850, stands 67 feet in height, and contains nearly 63 tons of bronze. 'La Vierge du Puy,' by Bonnat-sienx, is 51 feet high, and contains about 100 tons of bronze. For Bartholdi's 'Liberty' and other famous bronze figures, see COLOSSUS.

*Iron-founding*, from the nature of its operations and the gigantic scale on which it is carried on, may be regarded as a separate and distinct industry. The large-grained, gray pig-iron, on account of the highly fluid condition into which it can be brought, is the material principally employed; but according to the size of the castings required and the purposes for which they are to be used mixtures of finer grained pig are also melted up. The metal is melted with coke in a round firebrick furnace called a *cupola*, the heat being urged by means of a powerful blast created by fans revolving at a high speed. The molten metal is run from a tap at the bottom of the furnace into a malleable iron ladle lined with clay, from which it is poured into the mould through holes called *runners* or *gates*. When the mould is newly filled numerous jets of blue flame issue from as many small holes pierced in the sand. These perforations are necessary for the escape of air and other gases produced by the action of the hot metal on the mould. Care must also be taken not to have the mould too damp, otherwise steam is generated, which may cause holes in the casting, or even force part of the metal out of the mould. The casting remains covered up for a time in order to cool slowly, and is then removed by breaking away the sand and drawing out the core.

In the case of a fluted or otherwise ornamented pillar the pattern would require to be in at least four pieces instead of two, because it is only a plain pattern that will come out of the mould in halves without tearing away the sand. When a pattern is necessarily made in several pieces it is drawn out of the mould bit by bit, to the right or left as the case may be, and so parts from the sand without breaking it.

Suppose that a small ornamental vase were to surmount the pillar, the founder would prepare the pattern of this in a more elaborate manner. He would first mould it in wax or clay, from which a cast in plaster of Paris is made; from that again a cast is taken in an alloy of tin and lead, which, after being sharply chased and divided into the required number of pieces, is used as a pattern to cast from. All ornamental patterns, such as figures, scrolls, leaves, enriched mouldings, and the like, are made in this way, whatever metal the ultimate casting is to be produced in.

Very large engine cylinders, pans, and such vessels are cast in loam-moulds, which are built of brick, plastered with loam, then coated with coal-dust, and finally dried by means of a fire. This method is adopted with large plain objects where a pattern would be expensive, and when few castings

of one kind are required. Iron moulds, coated with blacklead or plumbago, are now used for water and gas pipe founding, which forms an extensive special industry. They are greatly more expensive than any other kind, but they enable the founder to dispense with a pattern, as, when once made into the required form, they are not destroyed like moulds of sand or loam at each casting.

For *chilled castings*, also, metal moulds or moulds partly metal and sand are employed. In these the molten iron solidifies and cools with great rapidity, owing to which it acquires extreme hardness, a quality of peculiar value for shot and for many purposes where wear-resisting properties are of more importance than toughness. In *malleable castings* the opposite effect of rendering the metal soft, tenacious, and partially malleable is obtained. For this end the finished casting is embedded in powdered hematite ore or other iron oxide, packed in an iron chest, and exposed for two or three days to a red heat in a furnace. Thereby the cast-iron parts with its carbon, and assumes the softness, tenacity, and infusibility of malleable iron. The process may be continued till the effect is produced throughout the mass acted on, or it may be stopped when merely a skin is decarbonised, leaving the core of unaltered cast metal.

In iron-casting, and especially in steel-casting, bubbles of carbonic oxide and other gases are formed, which partly escape and partly remain imprisoned in the mass, tending to render it vesicular and less sound than it might otherwise be. Various means have been adopted to promote the escape of imprisoned gases, and thereby to render the casting more homogeneous and strong. In Krupp steel the addition of silico-spiegeleisen to the cast metal acts favourably by stopping the evolution of the gases. To force out the gases the late Sir Joseph Whitworth in casting steel adopted the expedient of casting under pressure. While the metal was in a fluid condition he applied pressure of as much as from 6 to 9 tons per square inch over its surface, and by preventing the formation of air-bubbles he thereby obtained a remarkable increase in the strength of the castings so operated on.

The variety of articles produced by founding or casting are very numerous. Besides others incidentally alluded to, we may mention cylinders, cisterns, paper-engines, beams, boilers, pumps, and the heavy parts of machinery generally, gates, railings, lamps, grates, fenders, cooking-vessels, and the like in iron; cannon, many portions of machinery, and numerous ornamental objects in brass, bronze, and the more costly metals. See Mullin, *Modern Moulding and Pattern Making* (1886); Overman, *The Moulder's and Founder's Guide* (1880); Wylie, *Treatise on Iron Founding* (1884), &c.

**Foundling Hospitals**, strictly speaking, are institutions in which children that have been deserted by their parents or guardians are received to be nourished and reared for by private charity or at the public expense. Their primary purpose is to serve as a preventive of infanticide and the wilful procurement of abortion, and to counteract the temptation on the part of unmarried women to abandon their illegitimate offspring, and of married women to leave exposed on the streets children they are themselves either unwilling or unable to nurture and support. Although the practice of infanticide was largely prevalent amongst some of the nations of antiquity, especially the Greeks and Romans, amongst whom the father of a family possessed an almost absolute right of life and death over his children, even to selling them into slavery or to slaying them, nevertheless the state was not altogether careless of the preservation of foundlings

and abandoned children. Private persons were encouraged to take care of deserted infants, and to educate them, by decrees which assigned them as slaves to those who should thus adopt them. Of the rest—such as were not thus taken charge of—many were educated at the public expense. The ancient Egyptians, Jews, and Thebans (in Greece), however, looked upon infanticide as a crime; and this also was the sentiment of the ancient Germans. But from the time when Christianity became the state religion of the Roman empire a sensible change began to show itself amongst its leading peoples in relation both to infanticide and to the exposure of children. The more enlightened emperors, as Constantine, Valentinian, and Justinian, devised legislative measures for the prevention of both offences. But it was only when the church turned its attention to the matter seriously that the preservation of those unfortunates began to be carried out in a systematic way. In spite, however, of imperial edict and ecclesiastical exhortation, exposure and the selling of offspring, especially in times of public calamity or distress, still continued to be largely practised, more particularly in the Western empire. The germ of the modern foundling hospital may perhaps be found in an institution which owed its existence to the Bishop of Treves in the 6th century: in the cathedral porch a large marble basin was built, in which children might be placed, to be afterwards reared by members of the church under the superintendence of the ecclesiastical officers. Similar arrangements are mentioned in some of the capitularies of the Frankish kings. But the first well-authenticated instance of a foundling hospital, as we now understand the term, is one that was established at Milan in 787. From the end of the 11th to the end of the 14th century several institutions of a similar character were founded in some of the chief towns of France, Italy, and Germany. It is, however, in the first-named country that they have received the most attention and been most thoroughly studied and organised.

At Paris foundlings were generally deposited in the porch of Notre Dame. For the reception of children so exposed Marguerite de Valois opened a special home in 1536, and nine years later the government afforded shelter to 136 orphans in the Trinity hospital. But, no provision being made for their sustenance, they were dependent upon the alms which their nurses begged on the streets or which they themselves could collect when old enough to go a-begging; till in 1552 the parliament of Paris set apart for their maintenance the proceeds of a special tax. Amongst these children the mortality averaged 90 per cent. About the same time the Bishop of Paris built another house of refuge for foundlings picked up within his diocese; this was known as the *Couche*. But the accommodation was insufficient, and children were selected for admission by lot, those who were not elected being generally left to die on the street. Subsequently the inmates of the *Couche* became the objects of a brisk traffic, children being sold to professional beggars, acrobats, and others at the fixed price of 20 sous each. These evils at length attracted the attention of St Vincent de Paul, who in 1633 established a more satisfactory home and a humane system of treatment. Out of this grew the celebrated Foundling Hospital of Paris, which was incorporated in 1670. With it the *Couche*, reformed and enlarged, was joined in 1688, and Marguerite de Valois's orphanage in 1772. Under the Revolution all illegitimate children and foundlings were virtually adopted by the state, which in 1793 issued a decree bestowing a premium upon all girls who should declare themselves to be the mothers of illegitimate children, and, as the Emperor Trajan had

dene, proclaiming all such infants 'children of the country.'

At the Foundling Hospital of Paris children are admitted (since 1886) under conditions which allow any person to leave a child openly without giving an account of it; in fact, the system in vogue is that of indiscriminate admission under the cover of secrecy. The infants admitted belong to the following categories: foundlings proper—i.e. children deserted by parents who are unknown; children who are abandoned by parents who are known; and orphans left destitute, the general designation for them all being not *enfants trouvés*, but *enfants assistés*; besides these, the hospital also takes in children *moralement abandonnés*—i.e. incorrigible children sent by the law-courts, by the prefecture of police, or by their parents. The scope of the institution is not, however, confined to this; it also gives presents of money, baby-clothes, and cradles to mothers who are poor, and sends out nurses to give suck to the infants of such women as cannot themselves perform that service for their offspring. As a rule infants only remain in the establishment at Paris a short time—the average is four days; when adjudged strong enough to travel, they are sent with their nurses into the country, to be boarded with peasants or artisans. For the custody of each child the government pays a monthly subsidy, decreasing from 15 francs during the first year to 6 francs during the twelfth. Once that age is reached nothing further is paid; the child is then generally apprenticed to its foster-father if he is an artisan, or becomes his domestic servant if he is a peasant engaged in agriculture. The central administration, however, still keeps its eye upon these children through its provincial inspectors, nor does it lay down its guardianship or cease its surveillance of them until after they have attained twenty-one years of age. These inspectors also keep the provincial hospitals and the central hospital at Paris supplied with wet-nurses, recruited from the women of the countryside. Parents are allowed to reclaim a child at any time on satisfactorily establishing their title to it, and that without recouping the expense of rearing it. Also, persons who prove to the satisfaction of the hospital administrative authorities that their motives are sincere and laudable are allowed to adopt a child from amongst those whose parents are altogether unknown. On an average about 12,500 children pass through the hands of the authorities of the Paris hospital annually. Of these nearly 4000 are *enfants assistés*, and 1200 *enfants moralement abandonnés*, amongst whom the mortality is about 3 per cent. Besides these some 7000 children are assisted outside; and amongst them the mortality is 16 per cent. The provincial statistics show an average number of 36,000 children annually under the surveillance of the authorities, of whom 27,000 are *enfants assistés*; of these children about 3 per cent. die annually, though of the children under one year of age about 22 per cent. die every year. Besides these there are between 3000 and 4000 incorrigible children. The administration has established a savings-bank for the benefit of its wards, with the result that at the end of 1886 there stood to the credit of each *enfant assisté* an average of 179 francs, and of each incorrigible child an average of 20 francs.

In the United Kingdom and Germany the care of foundlings is for the most part left to the active ministrations of the charitable or to the operations of the poor-law administration. For instance, the Foundling Hospital of London, established in 1739 by Captain Thomas Coram (q.v.), is not, strictly speaking, a foundling hospital at all, nor does it receive any governmental or parochial subsidy; it is reserved exclusively for illegitimate children, the offspring of mothers who have previously borne a

good character, and who themselves make personal application for the admission of their infants. The institution supports constantly about 500 children, of whom some 140 under four years of age are boarded out in the country. Of the remainder the girls continue in the hospital until they are fourteen years of age, when they are sent out into domestic service; the boys on reaching their sixteenth year are apprenticed to trades, or enter the army, or become clerks. But, as in France, they remain up to their twenty-first year under the charge of the hospital authorities, who receive annual reports of their behaviour, and reward the most deserving with donations of money. The mortality of the inmates in the country is about 4½ per cent.; in the city hospital there is about one death annually. The real foundlings of Great Britain, together with the waifs and strays, are received either into the workhouses or into private charitable establishments, like Dr Barnardo's homes or the infant orphan asylum at Wantage.

Russia possesses two large foundling hospitals, one at Moscow, admitting 13,000 children per annum, and the other at St Petersburg, which accommodates an annual average of 7500. Here the rules of admission are so lax that it is no unusual thing for a woman to expose her own child at the hospital, and then get herself put on the staff of wet-nurses to nurse it. This is done for the sake of the good living and the small daily wage granted to nurses in the hospital; after they take the child home with them the daily wage is changed for a monthly gratuity that is continued until the child reaches ten years of age. Indeed, many cases occur in which married women leave their own infants of tender age at home, where they are not properly attended to, and go to serve as wet-nurses in the hospitals. This evil it was sought to counteract in France by putting the infants out to nurse in a different department from that in which they had been exposed; but this system of *déplacement* was soon abandoned on the ground of expense and loss of control. At St Petersburg and Moscow infants prematurely born are reared in 'frames very like those used for melon culture,' padded inside, and surrounded outside with a jacket of hot water, so that the temperature may be kept uniform. Foundling hospitals exist in most of the countries of Europe, particularly in Italy, Austria, Spain, and Scandinavia.

In the United States deserted children are for the most part sent to the almshouses, or are taken care of in private charitable institutions, like the foundling asylum of the sisters of charity, for instance, in New York city, established in 1869; the infants' hospital, established in 1808; the nursery and child's hospital; and the infant asylum, organised in 1871—all at New York. There are large foundling hospitals at Mexico, Rio de Janeiro, and at Buenos Ayres (founded in 1774, with an annual average of about 1200 to 1300 inmates). China, it should be stated, has admirably conducted establishments for the care of destitute and abandoned children in nearly all the large cities of the empire.

During the early part of the 19th century it was customary for foundling hospitals to be provided with a revolving pillar or basket or wheel, a contrivance by means of which a child could be deposited at a foundling asylum without the person who left it there being seen or any questions asked. This apparatus, which was indeed first used at Marseilles about the beginning of the 18th century, was largely employed in France, Belgium, Italy, and elsewhere; and, though it has been almost entirely abolished, it still survives in a few foundling hospitals of Italy. And the new regulation put in force at the Paris hospital in 1886 is virtually

a return to the principle underlying the use of this apparatus—viz. secret and indiscriminate admission. The revolving box was condemned on the ground that it acted as an encouragement to parents to abandon their off-spring, and thus weakened the sense of parental responsibility.

Foundling hospitals have been condemned on the ground of the great mortality which takes place in them. For instance, the Dublin hospital, which for several years from 1704 received from 1500 to 2000 children annually, was finally closed in 1835 on account of the excessive mortality, the death-rate being 4 in 5. Again, the asylums of Russia have for many years lost 50 to 60 per cent. of the infants annually sent to them; at Buenos Ayres the mortality is 50 per cent.; in Vienna it rose even as high as 75; and it stood at a high figure in France, Italy, and Portugal. But in the case of France and London at least a great improvement has been effected, the percentage for each being less than 4, except in the case of children under one year of age boarded in the rural districts in France. Another system of rearing, and sometimes killing off, illegitimate children is that known as baby-farming, for which see INFANT.

Osborn (1886); and *Annuaire Statistique de Paris*.

**Found Property.** See LOST PROPERTY.

**Fountain,** a basin or an artificial structure for the supply or the ornamental display of water. There are fountains of every form and variety, from simple springs with their natural basins to the most elaborate monumental structures, in which ornamental jets and artificial basins are combined. In civilised countries fountains have at all times been considered as public monuments of the greatest importance; and, where the source of their supply has not been provided by nature on the spot, immense labour and expenditure have been incurred to make up for the deficiency. The splendid Aqueducts (q.v.) of the Romans are instances of the important light in which they regarded the fountains of their cities. Every Roman town had at least one aqueduct, the water from which was distributed to as many fountains as the population required.

In early times utility was the first object of a fountain, and the ornamental features of the structure into and through which the water was led were strictly developments of their original utilitarian purpose. Springs were highly valued, especially in lands where water was scarce; many of them were associated with the names of saints, and sacred traditions accumulated around them. Sometimes, therefore, such springs were built around for protection, statuary figures of their patron saint were placed in niches, and artificial basins were provided to contain the water. In towns where a number of persons might require to draw at one time a large basin was erected with a pillar in the centre, from which pipes radiated all round—each with its separate jet to supply the running water—while the basin was used for washing the pitchers. Many examples of this kind of fountain remain throughout Italy and in the older German towns, of which the fountain at Viterbo and the Schöner Brunnen at Nuremberg may be mentioned as examples. The pillar is sometimes surmounted by a statue, or has one or more smaller basins with ornamental streams and jets of water falling from tier to tier. A beautiful fountain of this nature existed in the royal palace at Linlithgow, and a modern reproduction of it may be seen in front of Holyrood Palace at Edinburgh.

Where modern views of water-supply and sanitation are carried out, under which water is led into each household by gravitation, great public fountains have become purely ornamental structures.

Fontana Grande, Viterbo.

Small pillar fountains are yet commonly placed on streets and places of public resort for wayfarers, and similarly basin fountains are provided for horses and other animals. The Metropolitan Drinking Fountain Association was formed in London in 1839. Of ornamental fountains the most magnificent display is at Versailles. Paris also contains several very remarkable fountains, and in England the display at the Crystal Palace, Sydenham, is very fine. Chatsworth is remarkable for its fountains, one of which is said to throw a jet of water 267 feet high. Although Rome has lost four-fifths of the aqueducts which so lavishly supplied her with fresh water in the time of the Empire, she is still unsurpassed for the number, beauty, and utility of the public fountains which adorn her streets and palaces.

In connection with recent international exhibitions, a method of artificially controlling and illuminating fountain jets has been elaborated, by which a great variety of effects and chromatic combinations are obtained. Within a large basin a series of jets are arranged, and under the basin is a subterranean chamber with plate-glass discs under each jet. Powerful electric lights are provided in the chamber, so that the jets are illuminated from below, each with one or more lamps. By a mechanical contrivance slips of coloured glass can be at will interposed between the arc-light and the jet, and it is the duty of an operator in the chamber to vary and change the glasses in accordance with signals sent to him. The jets are forced and controlled by one or more pumping engines in a station apart, in which the requisite engines and dynamo-machines for producing the electric light also are placed. In a separate manipulating tower there is a system of levers, pushes, and signals, by which the operator has direct control of the water-jets, and the means of giving signals to the officer in the subterranean chamber to produce such combinations and change of colours as he may desire. In this way the height and combination of jets and the colour of the light illuminating them can be instantaneously varied; and the effects by night are very striking.

**Fountains Abbey,** one of the largest and best-preserved monastic edifices in England, in the West Riding of Yorkshire, 3 miles SW. of

Ripon. Founded for Cistercians in 1132, it was not completed till the 16th century, so offers every variety of style, from Norman to Perpendicular. See Wallran's *Fountains Abbey* (Surtees Soc. 1863).

**Fouqué, FRIEDRICH HEINRICH KARL, BARON DE LA MOTTE**, German romanticist, was of Huguenot ancestry, and grandson of the Prussian general of this name (1698-1774) distinguished in the Seven Years' War. Born at Brandenburg, 12th February 1777, Fouqué served as Prussian cavalry officer in the campaigns of 1794 and 1813. The interval between these campaigns was devoted to literary pursuits in the country, and the rest of his life was spent alternately in Paris and on his estate at Nennhausen, and after 1830 at Halle. He died in Berlin, 23d January 1843. Fouqué appeared first under the pseudonym Pellegrin, as author of *Dramatische Werke* (1801). But Norse legend and old French and German poetry attracted him most strongly; one sees this in his long series of romances, both prose and verse, which picture the life of medieval Europe. These include *Sigurd* (1808)—the first work to which Fouqué attached his real name—*The Magic Ring*, *Thiodulf the Icelandic*, *Aslaug's Knight*, *Sintrun and his Companions*, *The Two Captains*, and *Undine*, of all of which and of several other romances English translations appeared soon after Fouqué's death. His masterpiece is *Undine* (1811); its tender grace and fairy glamour are exquisite. Otherwise Fouqué is too often chargeable with all the extravagances of the romantic school. Straining after fantastic conceits, he seems fascinated by the antique life which he pictures, rather merely from its quaint contrast with modern manners than as a form into which the life of æreal living men had shaped itself in bygone days. He himself edited a selection of his works (*Ausgewählte Werke*, 12 vols. Halle, 1841). His second wife, Karoline (1773-1831), is also known in Germany as the author of innumerable romances and stories.

**Fouquet, NICOLAS**, Viscount of Meun and of Vaux, and Marquis of Belle-Isle, finance minister under Louis XIV. of France, was born at Paris in 1615. Attaching himself closely to Mazarin, he received in 1630 the important appointment of *procureur-général* to the parliament of Paris, and three years later was advanced to be superintendent of finance. His rapid advance made him ambitious of succeeding Mazarin as first minister, and in order to secure himself friends and a party he distributed money with a lavish hand; but he had a formidable rival in Colbert. Fouquet's plans were, however, brought to nought; for in the first place Louis himself took the reins of power into his own hands when they slipped from the grasp of the deul cardinal, and in the second place, instigated thereto by Colbert, he suddenly arrested Fouquet in September 1661. After a trial extending over three years, Fouquet was sentenced to perpetual exile and the loss of all his property, but the sentence was afterwards altered to life-long imprisonment in the fortress of Pignerol, where he died 23d March 1680. As an example of the extravagance and gorgeous display made by Fouquet, it may be mentioned that shortly before his arrest he entertained the king at a banquet which cost 120,000 livres in his castle of Vaux, erected by him on a plan very similar to that afterwards embodied in the royal palace at Versailles. From the circumstance of his imprisonment at Pignerol, Fouquet, in spite of the fact that he died in 1680, has been identified with the Man with the Iron Mask (q.v.), who, however, lived until 1703.

**Fouquier-Tinville, ANTOINE QUENTIN**, one of the most notorious actors in the French Revolution, was born in the village of Hérouelles, in

the department of Aisne, in 1747. Originally an attorney of dissolute habits, he ranged himself, on the outbreak of the Revolution, in the ranks of the most violent among the democrats. Appointed by Robespierre and Danton public prosecutor to the Revolutionary Tribunal on 10th March 1793, he superintended during the Reign of Terror, until 28th July 1794, all the political executions decreed by the tribunal. His performance of his duties was characterised by pitiless rigour, brutality, and callous indifference. He apparently regarded it as his mission to supply the guillotine with a regular supply of victims, and no bribes were able to turn him from his purpose. And he sent his friends, among them Robespierre, Danton, and Hébert, to execution in the same spirit in which he sent their enemies. On the overthrow of the Reign of Terror he was himself guillotined on 7th March 1795.

**Fourchambault**, a town in the French department of Nièvre, 5 miles NNW. of Nevers, near the right bank of the Loire, which is here crossed by a suspension bridge. There are large iron-foundries, nail-works, and wire-works. Pop. 5949.

**Fourcroya**, a neotropical genus of Amarylhidaceæ, nearly allied to *Agave* (q.v.), and yielding a similar fibre.

**Fourier, FRANÇOIS MARIE CHARLES**, a French socialist, was born at Besançon, 9th April 1772. His father, a prosperous draper, had him educated in the academy of his native town. The boy excelled in the studies of the school, especially geography, and was passionately fond of flowers and music. He regretfully abandoned his studies for a business career, which he followed with zeal and integrity in various towns of France. As a commercial traveller he also visited Holland and Germany, where with remarkable insight and accuracy he took note of everything interesting in climate, productions, and manners. From his father Fourier inherited a fortune of about £3000, but, having started business for himself at Lyons, he lost nearly all he had at the siege of that city by the Jacobins during the Reign of Terror (1793). He was even thrown into prison, and narrowly escaped the guillotine. After his release and two years' experience as a soldier he returned to a commercial career.

At a very early age Fourier had his attention called to the abuses of commerce. When only five he was punished for speaking the truth about certain goods in his father's shop; and in 1798, while employed in a house at Marseilles, he had to superintend the destruction of an immense quantity of rice held for higher prices, in the midst of a scarcity of food, till it had become unfit for use. Believing that a system which involved such abuses and immoralities must be radically evil, Fourier set himself to discover an entirely new social theory, which he elaborated chiefly in three considerable works. In 1808 he published his *Théorie des Quatre Mouvements et des Destinées Générales*; in 1822 his *Traité d'Association Domestique Agricole*; in 1829 *Le Nouveau Monde Industriel et Sociétaire*. Written under the most discouraging circumstances, these works for many years found few readers and scarcely any disciples; only the most ardent faith in his own principles could have carried him through so many difficulties. For the last ten years of his life he waited at noon every day in his apartments for the coming of the wealthy capitalist who should furnish means towards the realisation of his schemes. It was chiefly after the decline of the Saint-Simon movement that he gained a hearing and a little success. A small group of enthusiasts gathered round him; a journal was started for the advocacy of his views; an attempt to establish a society on his principles was made

in 1832 near Versailles, but without success. At Paris, October 8, 1837, Fourier died, poor, but warmly appreciated by a circle of devoted disciples. In his private life he seems to have been a model of kindness, simplicity, and integrity.

The great aim of Fourier is to reconstruct society on principles which are entirely new. But his social system is more or less moulded and coloured by his peculiar views on cosmogony and psychology. His views of God incline, though not decidedly, to pantheism. The will of God pervades the world as a universal attraction. Whereas Newton proved that this universal attraction governs one movement of the world, Fourier shows that it rules the world in all its movements, which are four—material, organic, animal, and social. From this law of universal attraction there follows a universal analogy, according to which everything in one department of the world has its parallel elsewhere.

Fourier believed that the world has scarcely yet reached the adult stage, having existed only seven thousand years, whereas it is destined to last for eighty thousand years, a long period of progress being followed by a corresponding period of decline. At present mankind is oppressed by an endless variety of evils, which he sums up in one obnoxious word, *civilisation*, and which are due to the fact that we have run counter to the Creator in pronouncing passions to be bad that are simply natural. To effect the passage from social chaos to universal harmony there is but one way—to give a free and healthy development to the human passions.

This brings us to the psychology of Fourier, who recognised twelve radical passions, with three points of attraction; five sensitive (tending to enjoyment), sight, hearing, taste, smell, and touch; four affective (tending to groups), friendship, love, ambition, and familism or paterinity; three distributive (tending to series), the emulative, alternating, and composite. The meaning of the first nine is obvious enough. The emulative passion leads to intrigue, the alternating involves love of change; and the operation of the two might cause jealousy, disharmony, and war, were they not controlled by the composite passion and by a higher unity. Out of the free play of all the passions harmony is deduced, like white from the combination of the colours.

But for the realisation of this ideal new social arrangements are necessary. These are provided in the *phalange*, an institution in which the interests of social union and individual liking are to be thoroughly reconciled. Each *phalange* was to consist of 1800 persons, a number sufficient to include the whole circle of human capacities, adequately various, and yet not too large for a convenient common life. The individuals constituting the *phalange* were to be arranged in groups of seven or more persons; from twenty-four to thirty-two groups were to form a series, and a number of series united to form a *phalange* of the requisite size. The pervading idea of the whole organisation was a harmonious social life combined out of the free play of the most varied likings and capacities. The dwelling of the *phalange* was the *phalanstère*, a vast, beautiful, and commodious structure in the centre of a highly cultivated domain, a square league in extent, where life would be arranged to suit every one, common or solitary, according to preference. As regards the institution of marriage Fourier would permit a freedom which would be subversive of such social order as now exists.

It is an obvious deduction from Fourier's principle of universal attraction that human life generally, and labour in particular, should be attractive. In the *phalange* labour is accordingly made attractive by constant regard to the likings and capacities

of every one, and by continual change of occupation. The results of labour were to be distributed in the following manner. Out of the common gain of the *phalange* a very comfortable minimum was apportioned to each member, and the remainder was divided into twelve shares, of which five went to labour, four to capital, and three to talent. In distributing the reward to labour, the reverse of the present method was to be followed—i.e. necessary labour would be best paid, useful labour would come next, and pleasant labour would be worst paid.

So convinced was Fourier of the beauty and practicability of his social system that he believed it only required to be understood in order to be universally appreciated, and that in a very few years his *phalanges* would cover the whole world. The *phalanges* would arrange themselves in convenient groups with a common chief, and all would finally be united in a great federation, with Constantinople as capital. There never has been the least symptom of the realisation of such a dream. The system of Fourier has so little touch with fact and reality that it is hardly worthy of serious discussion. His road to the social millennium is far too easy. Yet his works are full of ingenious suggestion; and his criticism of the existing social order is often most searching and pungent. His theories may still be very profitably studied by the social economist.

Fourier's complete works were published at Paris (6 vols. 1840-46; new ed. 1870). The most eminent expounder of Fourierism was Victor Considérant, *Destinée Sociale* (1835); Gatti de Gainond's *Fourier et son Système* is an excellent summary. See also SOCIALISM; Pellarin, *Ch. Fourier, sa Vie et sa Théorie* (5th ed. 1871); L. Reyband, *Études sur les Réformateurs Modernes*; and Sargent, *Social Innovators* (1859).

**FOURIER, JEAN BAPTISTE JOSEPH, BARON DE**, French mathematician, was born at Auxerre, 21st March 1768. He became a pupil, and in 1789 a professor, in the military school of his native place; was afterwards removed to the normal school in Paris, and then to the Polytechnic, and accompanied Bonaparte to Egypt in 1798. On his return to France he became a contributor to the *Description de l'Égypte*, and also wrote the historical introduction. At the same time (1802) he was made prefect of the department of Grenoble, an office which he held till 1815, and was created baron in 1808. After Napoleon's escape from Elba Fourier took up his abode in Paris, and devoted himself exclusively to science, becoming a member of the Academy of Sciences in 1816, and afterwards secretary for life, conjointly with Cuvier. He died at Paris, 16th May 1830. His most famous work is the *Théorie Analytique de la Chaleur* (Paris, 1822), in which he applied new methods of mathematical investigation. An allied subject is discussed in his treatise on the temperature of the globe (1827). His analysis of Determinants, distinguished both for its substance and manner of exposition, and left unfinished at his death, was completed and published by Navier (Paris, 1831).

**Four Lakes**, a chain of deep lakes (Mendota, Monona, Waubesa, and Kegonsa) in Dane county, Wisconsin, connected by short outlets. Madison, the state capital, stands on an isthmus between Mendota and Monona.

**Four Masters**, ANNALS OF THE, an historical work composed in the Irish language, at the monastery of Donegal, by Michael O'Clery, a Franciscan monk, who enjoyed some reputation as a trained antiquary and historical writer. The work, which covers the history of Ireland from 1172 to 1608, with additions bringing the narrative down to 1616, was begun in the year 1632 and completed in 1636. Michael O'Clery was assisted in the work

of compilation and copying by his brother, Conary O'Clery, by a relative, Cucogry O'Clery, and by Cucogry O'Duigenan; hence the title of the book. See the edition (text and Eng. trans.) by Donovan (3 vols. Dublin, 1848).

**Fourmies**, a town in the French dep. of Nord, 12 miles SE. of Avesnes by rail, with mines, iron-works, and mills. There were great labour riots here in 1891. Pop. (1861) 3422; (1886) 11,766.

**Fowey**, or Foy, an old town of Cornwall, on the right bank of the river Fowey, 11 miles SSE. of Bodmin. It has a good harbour with a narrow entrance, and was formerly one of the chief seaports of England. Pilchards are cured, and 'china-stone' and iron ore exported. To the siege of Calais by Edward III. in 1347 it sent several ships. It was defended against the Parliament in 1644, and against the Dutch in 1667. Pop. 1636.

**Fowl**. See POULTRY.

**Fowler**, SIR JOHN, civil engineer, born at Sheffield in 1817, assisted in the construction of the London and Brighton and other railway lines, and was afterwards engineer of the Manchester, Sheffield, and Lincolnshire group of railways, besides many other lines, including the original 'under-ground' or Metropolitan Railway, London. River improvement and the construction of large docks have also occupied his attention, and he was made K.C.M.G. in 1885 for his services as consulting engineer in the public works in Egypt; but his greatest work is the Forth Bridge, designed by him and Mr B. Baker. See BRIDGE.

**Fowler**, THOMAS, English philosopher, was born at Burton-Stather, in Lincolnshire, 1st September 1832. He graduated at Merton College, Oxford, in 1854, and has ever since been closely connected with that university, first as tutor of Lincoln College, afterwards as professor of Logic from 1873, and as president of Corpus Christi College from 1881. His principal works are *Elements of Deductive Logic* (1867; 8th ed. 1883); *Elements of Inductive Logic* (1870; 4th ed. 1883); *Bacon's Novum Organum*, with notes and an introduction (1878); an edition of Locke's *Conduct of the Understanding* (1881; 2d ed. 1882); *Progressive Morality* (1884); and *Principles of Morals* (1887). Others are *Locke in 'English Men of Letters'*, as well as *Bacon*, and *Shaftesbury and Hutcheson in 'English Philosophers'*.

**Fowler's Solution**. See ARSENIC.

**Fowling**. See WILD-FOWL.

**Fox**, the name of a number of species of the family Canidae (q.v.), most of which are now referred to the genus *Vulpes*, distinguished from the genus *Canis* (see DOG) by certain minute differences in the form of the skull and of the teeth, the more elongated body, slender, pointed muzzle, elliptical, somewhat oblique pupil, and bushy tail. Representatives of the genus are found in the greater part of the northern hemisphere, but are conspicuously absent from South America.

The following species demand separate notice: (1) The Common Fox (*Vulpes alopecus*) measures on an average 4 feet in length, of which 16 inches are occupied by the tail; and 14 inches in height; the weight is from 15 to 22 lb. The head is broad, the brow flattened, and the muzzle rapidly tapering, long, and slender; the mouth is furnished with 42 teeth. The body, though apparently thick, owing to its hairy coat, is really lank, but strong and mobile; the legs are slender. The anal glands are strongly developed, giving the animal its well-known odour. The colour above is reddish-brown; the brows, shoulders, and posterior portion of the back, as far as the root of the tail, are shot with white, the hairs in these regions having white tips. The

hair on the lips, cheeks, and throat is white, and a streak of the same colour runs down the legs; the breast and belly are ashy and the flanks whitish gray, the feet red, the ears and toes black, and the tail reddish shot with black, and usually with a white tip. These various tints blend gradually into each other, and produce a *tout ensemble* which renders the animal remarkably inconspicuous.

Sportsmen have an extensive technical vocabulary for all that concerns the fox: the female is a 'vixen,' the young, 'cubs;' his head, a 'mask' or 'pate,' his feet 'paws,' and his tail a 'brush;' his drug is known as 'billet,' and his home is a 'keunol,' or, if underground, an 'earth.'

Common Fox (*Vulpes alopecus*).

Foxes occupy burrows in the ground, generally utilising those which have been made by badgers, while occasionally they live in company with these animals. These dens are preferably on the sides of hills, the apertures leading downwards and outwards, and consist of a central chamber with several means of exit. When suitable burrows are wanting, hollows under piles of stones, or even hollow trees have been used.

The fox's food embraces a wide range of nutriment, from a fawn or a lamb to beetles, or even vegetables or fruit; nothing comes amiss. Mice form a large percentage of his diet, and when half-sated he will play for long with his food before eating it. He hunts almost exclusively by night, and in his wanderings chooses the most secluded ways and takes advantage of every particle of shelter which the nature of the ground affords when passing from one covert to another. He is fond of warmth, and if undisturbed will bask for long in the sunshine; he runs rapidly and with great endurance, swims well, and has been known to climb trees in the search after eggs. The usual cry is a short bark, most commonly heard at the pairing season; the young ones use their voices freely when hungry. The pairing takes place in February, and the period of gestation is 60-63 days. Before the birth of the young, of which there are usually 4-7, the vixen pulls out the hair from her belly, partly to provide a soft bed for her offspring and partly to expose her nipples ready for their use. When born they are very helpless (both eyes and ears being closed) and covered with smooth brown fur. At six weeks old they appear outside the burrow, and at three months go hunting either alone or with the mother, who tends them with the utmost solicitude, and will face any danger or run any risk in their defence. A vixen has more than once been caught with no more than a mouse in her own stomach carrying home a plentiful supply of larger game to her young.

The fox's mental qualities are of a very high order. His cunning is proverbial, and his knowledge of localities and ability to profit by experience

have been highly developed in an arduous struggle for existence. 'More elegant than his relatives in mien and bearing; sharper, more prudent, calculating, and adaptive; of strong memory and sense of locality, resourceful, patient, resolute; equally skilled in jumping, slinking, crawling, and swimming, he seems to unite in himself all the qualifications of a perfect highwayman, and, when his lively humour is also taken into consideration, produces the impression of a highly educated artist in his own line.' When taken very young the fox has been successfully tamed, but he does not exhibit that capability for domestication for which his congener the dog is so remarkable. With this latter, however, he agrees in the parasites by which he is infested and the diseases to which he is liable. Even hydrophobia has been known to attack him, and to have been by him communicated to human beings. He has many enemies; the wolf and dog attack and kill him even when they do not devour; the hawk and eagle take the cubs, and the latter sometimes the adults. His chief foe is man. In northern countries where he is abundant the fox is slaughtered for his fur. The skins are brought from Poland, Russia, and the whole of Siberia. The black variety is much rarer and consequently more valuable than the red.

In Britain the fox has a facetious value as the object of a time-honoured sport, which, though it leads to his being pursued to the death by horse and hound, is still the sole reason why he has not long ago shared the fate of the wolf (see FOXHUNTING). In former days many foxes were dug out of their holes in Germany for the sport of 'tossing.' Long, narrow nets were spread out in front of the holes, the opposite ends of each being held by a lady and gentleman; as soon as reynard in his attempt to escape ran upon the net this was suddenly tightened and the unfortunate creature hurled aloft like a schoolboy in a blanket; and this was repeated until he happened to fall upon solid ground and eluded his tormentors.

Several varieties of the common British form are known to sportsmen; the *Greyhound Fox*, which occurs in the mountainous parts of England and Scotland, is tall, long-limbed, and strong; the *Mastiff Fox* is shorter and stouter, whilst the *Cur Fox* is known by his black-tipped tail. In addition to these several more conspicuous variations have received names and been by some regarded as distinct species. The *Coal Fox* (*V. alopecurus*) is found in Switzerland and Bavaria, and has a black-tipped tail. The *Cross Fox* (*V. crucigera*) is distinguished by a longitudinal dark line down the back and a transverse one over the shoulders. The *Black-bellied Fox* (*V. melanogaster*) is restricted to the south of Europe, and is sufficiently described by its name.

The *Red Fox of North America* (*V. fulvus*) is very little removed from its European congener: it is not so enduring, but runs with great speed for about 100 yards. Its skin is eagerly sought, and no less than 60,000 come annually to the London market.

(2) The *Gray Fox* (*Vulpes cinereo-argenteus*, *V. virginianus*); sometimes made the type of a distinct genus *Urocyon*) is somewhat smaller than his European relative, and has comparatively longer legs and a shorter tail; the colour is a peculiar speckled gray, due to the hairs being white at the roots and black with white rings in the distal portions. It is abundant in the southern United States, but does not occur north of Maine. It is not so swift as the red fox, but is even more cautious and timid, though its habits are in general similar. It has been seen to stalk game like a pointer.

(3) The *Corsac or Steppe Fox* (*Vulpes corsac*) is the Asiatic representative of the common fox; than this it is decidedly smaller, measuring at most

3 feet in length; it is also somewhat taller, and shorter in the tail, and has a rounder pupil. The colour in summer is reddish, but in winter it becomes paler owing to the development of a white ring round the individual hairs near their extremities. The throat, lower surface of the body, and inner surfaces of the legs are yellowish-white, and there is a three-cornered, dark-gray patch in front of each eye. The tail is dark above, and has a black tip. This species extends from the Caspian Sea to Mongolia, wherever there are extensive steppes, but it never occurs in forests or mountains. Its habits are like those of the European form. It is eagerly pursued by the Kirghiz and Threomians for the sake of its fur: all the ordinary means are employed for its capture, and in addition eagles are trained to hunt it, and it is forcibly dragged from its earth by an apparatus resembling a magnified corkscrew. About 50,000 skins are said to come into the market annually.

(4) The *South African Desert Fox* (*Vulpes caama*) is only about half the size of the European fox, and is said to live almost entirely on ostrich eggs, which it rolls from the nest to its burrow and then breaks against a stone.

(5) The *Fennec* (*Vulpes zerda* or *V. cerda*) is a delicately-formed little creature, remarkable for its large eyes and enormous ears, which have led some authorities to place it in a special genus (*Megalotis*). It is found in the deserts of northern Africa and the adjoining parts of Asia, and lives in burrows in the ground, usually near the roots of shrubs. Unlike the common fox it excavates its own home, and is able to dig so rapidly that it can often hide in this manner when pursued. Small birds are its favourite food, but it will also eat lizards, beetles, and grasshoppers, or even vegetable products such as dates or melons; fennecs have been supposed by some to be 'the little foxes that spoil the vines' of Scripture. They produce three or four young ones at a birth, which are tenderly cared for by the mother. When taken young they soon become very tame; they are captured by snares fastened at the entrance of their burrows, and, strange to say, they make no attempt to bite the nooses, though they struggle hard to break them.

(6) The *Arctic Fox* (*Vulpes lagopus*) is very well characterised by its short, blunt snout, rounded ears, short legs, and hairy covering to the soles of the feet, whence the specific name. The summer coat is brownish or gray above and on the sides, and white below; but as winter approaches the colour of the whole becomes pure white, although individuals are occasionally observed which have not changed their hue. The species is distributed over the polar regions of both the Old and New Worlds, as well on islands as on continents: it only wanders exceptionally south of the 60th parallel of latitude. The cubs are born in the latter half of June, the vixen choosing a cleft in the rock or some similar position for her nursery. Its food consists of any animals which it is strong enough to overpower, especially mice and lemmings; but in case of need it will eat creatures of any kind that may be cast up by the sea, and will even venture into the huts of the Eskimo and steal whatever it can carry away, whether edible or no. When food is abundant it will conceal it and return to its store in time of need. In character it presents a curious mixture of cunning and of impudence. Steller records that during his stay on Behring Island the foxes would come and try to take the meat from the hands of himself and his comrades, gnaw their boots, or sniff around their faces as they lay asleep; and also that in spite of numbers being slain they did not become shy. That this was not entirely due to lack of acquaintance with human beings is shown by their exhibiting the same characteristics in

Norway. When young they can be easily tamed, and as pets have the advantage of being free from the disagreeable odour associated with most foxes. The fur is a marketable article, though not so valuable as that of the other species. About 10,000 skins are brought to Britain yearly.

**FOX, CHARLES JAMES**, Whig statesman, was a son of Henry Fox, first Lord Holland, by Lady Georgiana Carolina, eldest daughter of the Duke of Richmond. He was born on the 24th January 1749, and was educated at Eton and Oxford, spending part of his vacations on the Continent in the gayest and wittiest circles of the French capital, and visiting Switzerland and Italy. Notwithstanding the irregular life which he led even as a schoolboy, he was very distinguished for ability both at school and college; and so high was his father's opinion of his talents that at the age of nineteen he had him brought into parliament as member for the borough of Midhurst, a step to which he is said to have been further incited by the fact that, even at this early age, Fox's energies had found an outlet in gambling and other forms of dissipation. His precocity in vice, as well as in intellectual development, is said to have been the result of the injudicious fondness of his very unprincipled but very gifted father. Till he attained his majority Fox prudently kept silent in the House, but immediately thereafter he appeared as a supporter of the administration of Lord North, and was rewarded with the office of one of the lords of the Admiralty. In 1772 he resigned that office owing to a difference with Lord North, but the following year was named a commissioner of the Treasury. From that post he was dismissed two years afterwards, in consequence of another quarrel with Lord North, and passed over to the ranks of the opposition. During the whole course of the American war he was the most formidable opponent of the coercive measures which were adopted by the government, and the most powerful advocate of the claims of the colonists; acting, to this extent at least, in accordance with the views which for many years before had been urged upon the country by the great Lord Chatham. The difference between them was that, whereas Lord Chatham urged conciliation in order to preserve the connection between the two countries, Fox foresaw and foretold the necessity and the advantages of complete separation.

In 1782, on the downfall of Lord North, Fox was appointed one of the secretaries of state, which office he held till the death of the Marquis of Rockingham. On the dissolution of the Shelburne administration in 1783 the North and Fox coalition was formed, and Fox resumed his former office; but the rejection of his India Bill by the House of Lords soon after led to the resignation of his government. It was now that Pitt came into power, and that the long and famous contest between him and Fox, who occupied the position of leader of the opposition, commenced. In 1788 Fox enjoyed a short respite from his public labours. Accompanied by his wife, he visited the Continent, and after spending a few days at Lausanne in the company of Gibbon, who was there engaged in writing his famous history, he set out for Italy. The sudden illness of the king, however, and the necessity of constituting a regency rendered it undesirable that he should be longer absent from England, and he hastened back to his post. The regency, the trial of Warren Hastings, the French Revolution, and the events which followed it gave ample scope to the talents and energies of Fox, and on all occasions he employed his influence to modify, if not to counteract, the policy of his great rival. He was a strenuous opponent of the war with France, and an advocate of those non-intervention views which find greater favour in our day than they did in his.

After the death of Pitt in January 1806, Fox was recalled to office, and endeavoured to realise his doctrines by setting on foot negotiations for a peace with France, the results of which he did not live to witness. He was on the point of introducing a bill for the abolition of the slave-trade, when he died at Chiswick, on the 13th September 1806, in his fifty-ninth year. In private life Fox was a genial companion, kindly and sincere in the closer relations of friendship, whilst his conduct to those to whom he was opposed in public was generous, and free from every trace of malignity or enmity. Lord John Russell, in the preface to his *Memorials and Correspondence*, speaks of the singular candour, boldness, simplicity, and kindness of his character; and of his oratorical powers it is enough to record that Burke called him 'the greatest debater the world ever saw,' and Sir James Mackintosh, 'the most Demosthenian speaker since Demosthenes.' His remains were interred in Westminster Abbey, near to those of Pitt.

See, besides the *Life and Times* and the *Memorials and Correspondence*, by Earl (then Lord John) Russell, the *Character of the Late C. J. Fox*, by Dr Parr (1809); the interesting *Early History of C. J. Fox*, by Sir George Trevelyan (1880); and the *Life* by H. O. Wakeman (1890).

**FOX, GEORGE**, the founder of the Society of Friends (q.v.), commonly called Quakers, was born in July 1621, at Penny Drayton in the south of Leicestershire. His father, a woollen-weaver, apprenticed him at an early age to a man who combined the trades of shoemaking, wool-dealing, and farming. With him George was principally employed in tending sheep—an occupation which suited his meditative disposition. When about nineteen years of age his religious convictions deepened to such an extent as to make him believe he was the subject of a special divine call to leave his native place and his friends, 'to forsake all, young and old, to keep out of the way of all, and to be a stranger to all.' Bible in hand, he wandered about the country, spending even his nights in the open air, a small competency he had supplying his slender wants. From his clothing he became known as 'the man in the leather breeches.' He soon began to attend meetings, and often to interrupt divine services, especially when these were conducted by 'professors,' persons whom he believed to be formalists and not genuine Christians, and when held in 'steeples-houses' and called together by church-bells, to which he had a special antipathy. The church he held to be the pillar and ground of truth, made up of living stones and lively members, a spiritual house of which Christ is the head. He was not, he said, the head of a mixed multitude, or of an old house composed of limo, stone, and wood. The 'inner light,' in which all orthodox Christians now believe, though to him it seemed a special revelation which he afterwards found in the Scriptures, was the central idea of his teaching. He was not only a great religious, but a great social reformer. As the former he inveighed against everything approaching to sacerdotalism and formalism. As the latter he ran a tilt against all social conventionalism. Not only priests, but lawyers and soldiers, were obnoxious to him as the embodiment of principles which he hated. Everywhere he went he was a marked man: his dress, his mode of speech, his manners, were different from those of others. 'The Lord' forbade him 'to put off his hat to any, high or low,' and 'he was required to *thee* and *thou* all men and women, without any respect to rich or poor, high or low, great or small. And as he travelled up and down, he was not to bid people *good morning* or *good evening*, neither might he bow or scrape with his leg to any one.' He saw the evils of intemperance, and denounced all public

amusements. He thus came into collision with all sorts of people, and his life is indeed little else than a record of insults, persecutions, and imprisonments, to which his zeal and indiscretions subjected him. His experiences of prison were numerous, and of such a nature as to make him one of the earlier of prison reformers. Arrested on one occasion by Colonel Hacker, he was taken to London to be examined by the Protector, who became convinced of his sincerity and of the harmlessness of his tenets. This, however, did not prevent the continued persecution of himself and his followers, who in 1656, the year after they refused to take the oath of abjuration, had increased to such an extent that there were nearly one thousand of them in gaol. He visited Wales and Scotland, and after his marriage to the widow of Judge Fell he went to Barbadoes, Jamaica, America, Holland, and various parts of Germany. In these later wanderings he was accompanied by Penn, Barclay, Keith, and others of the more eminent of the second generation of Quaker ministers. He died 13th November 1690. Amongst his last words were: 'All is well. The seed of God reigns over all, and even over death itself.' Full of personal peculiarities, guilty of many indiscretions, he was yet an amiable and Christ-like man, with a heart full of love for his fellows, and a mind so capable and comprehensive as to enable him to institute the admirable systems of registration, poor relief, education, and self-help, which have made the sect he founded a real social power. His preaching and writings were often turgid, incoherent, and mystical. As a writer he will be always remembered by his *Journal*, full of heart and intellect, valuable as giving with extreme simplicity and an unflinching regard for truth a record of his own life, and of the manners and customs, especially of the poorer classes, in the stormy times in which he lived. His writings were collected and published in 3 vols. (1694-1706). In 1832 an edition in 8 vols. was published at Philadelphia, United States. The exhaustive list of his writings in Joseph Smith's *Descriptive Catalogue of Friends' Books* (1868) occupies no less than fifty-three pages.

See Sewall's *History of the Quakers; The Quakers*, by Principal Cunningham; Neal's *Puritans*; Marsh's *Life of Fox* (1848); Lives by Janney (Phila. 1853) and John Selby Watson (Lond. 1860); and *George Fox and the Early Quakers*, by A. C. Bickley (Lond. 1884).

**FOX, WILLIAM JOHNSON**, orator and political writer, was born in 1786 near Southwold, Suffolk, the son of a small farmer, who afterwards settled as a weaver at Norwich. Sent to Homerton College to be trained for the Independent ministry, he subsequently seceded to Unitarianism, and ultimately delivered a series of prelections at his chapel in South Place, Finsbury, which marked him out as the leader of English rationalism. When the Anti-corn-law League enlisted the ablest platform orators of the day in the service of free trade, his bold and impassioned rhetoric greatly contributed to arouse and intensify public feeling. M. Guizot quotes his speeches as the most finished examples of oratory which the great conflict produced. Their effect upon the vast metropolitan audiences to which they were addressed was electric. Fox also contributed by his pen to the success of free trade, and his *Letters of a Norwich Weaver Boy* were largely quoted and read. From 1847 till 1863 he sat as an advanced Liberal for Oldham in parliament, where his success was hardly equal to the oratorical promise of his platform and pulpit career. His best parliamentary speeches were upon the education of the people. One of the earliest contributors to the *Westminster Review*, he edited for many years the *Monthly Repository*, and published many lectures, &c., col-

lected in the Memorial Edition of his works (12 vols. 1865-68). He died 3d June 1864.

**Fox Channel**, the northern portion of Hudson Bay, washing the western shores of Baffin Land, takes its name from Luke Fox, an English navigator, who was born about 1585, explored Hudson Bay in 1631, and died subsequent to 1635.

**Foxe, JOHN**, the martyrologist, was born of respectable parents in 1516, at Boston, in Lincolnshire. At sixteen a fellow of Brasenose College brought him to Oxford, apparently as a private pupil. He seems to have attended Magdalen College School, and to have become an undergraduate of Magdalen College. He took his bachelor's degree in 1537, his master's in 1543, and was elected a fellow of Magdalen in 1538. He had already acquired a reputation by his Latin verses, but soon gave himself to the study of the Fathers, and of the theology of the Reformers, with the result that he found his position among less advanced colleagues at Magdalen in some, and voluntarily resigned his fellowship in 1545. For some time he was employed as tutor to the children of William Lney of Chalecote, Warwickshire; there he married early in 1547, and afterwards was engaged by the Duchess of Richmond as tutor to the children of her brother, the Earl of Surrey, who had been executed, 19th January 1547. During the reign of Mary, for safety's sake he retired to the Continent, and at Strasburg, Frankfurt, or Basel met all the leading Reformers, including Knox, Giindal, and Whittingham. At Basel he was employed as reader for the press in the printing-office of Oporinus. He returned on the accession of Elizabeth, was pensioned by his old pupil, now Duke of Norfolk, and received, in May 1563, a prebend in the cathedral of Salisbury. He lived chiefly in Cripplegate, London, and often preached. For a year he held a stall at Durham. But he was prevented from further preferment by his conscientious objection to wearing the surplice and other practices of the establishment. To his credit it must be said that he pleaded for religious toleration when some Dutch Anabaptists were condemned to the flames in London in 1575. He interceded for them with Queen Elizabeth and other persons in authority, but without effect. He died in 1587, and was buried in London, in the chancel of St Giles's, Cripplegate. Foxe published numerous controversial treatises and sermons, besides an apocalyptic Latin mystery play, called *Christus Triumphans* (Basel, 1556). But the work that has immortalised his name is his *History of the Acts and Monuments of the Church*, popularly known as *Foxe's Book of Martyrs*, the first part of which was published in Latin, in an octavo volume, at Strasburg in 1554, reprinted along with five other books at Basel in a folio volume in 1559. The first English edition appeared in 1563, in one volume folio. Sanctioned by the bishops, it was ordered by a canon of the Anglican Convocation meeting in 1571 to be placed in the hall of every episcopal palace in England; and it went through four editions in Foxe's lifetime, and numerous others since his death. Apart altogether from the vexed question of its historical value, it will survive as a noble monument of English. Foxe's statements cannot be accepted as trustworthy evidence, if unsupported from other sources. His story is doubtless substantially true, although his credulity and bitter prejudice hardly suggest critical capacity in the selection of his authorities.

He was warmly commended by Strype (who came into possession of Foxe's MSS.), Whitgift, Camden, Burnet, and Thomas Fuller. Apart from

Roman Catholic critics, many of whose attacks are justifiable, Foxe's exaggerations and want of historical precision have been best exposed by the Rev. Dr S. R. Maitland, in a series of pamphlets issued between 1837 and 1842. The biography of Foxe, attributed to his son Samuel, and published in both Latin and English in the 1641 edition of the *Acts*, is certainly apocryphal, although it has formed the basis of numerous popular memoirs.

The best edition is that in the 'Reformation' series of the Ecclesiastical Historians of England, edited by R. R. Mendham and Josiah Pratt (8 vols. 1853 *et seq.*), with Canon Townsend's vindication against the attacks of Romanists.

**Foxglove**, a species of *Digitalis* (q.v.). The Common Foxglove (*D. purpurea*) is a native of

Common Foxglove  
(*Digitalis purpurea*).

Britain, and a familiar and conspicuous ornament in woods and hedgerows, its flowering stem reaching a height of from 2 to 4 feet, or even more. It flowers from June to August. Both it and its white-flowered variety are frequently planted in gardens and shrubberies. Its English name, the German name Fingerhut ('thimble'), and the botanical name *Digitalis* (Lat. *digitale*, 'the finger of a glove') refer to the form of its flowers. The foxglove was a favourite with the fairies, and was called in Ireland Fairy-cap, and in Wales Elf-glove, elsewhere Fairy-fingers, Fairy-petticoats. But there seems no good ground for the attempt to make out that foxglove is a corruption of Falk's-glove, for Good-folk's Glove, or Fairy-glove. Another English provincial name is Fox-fingers.

**Foxhound.** On no breed of dog, with the possible exception of the greyhound, has the same care and

attention been spent as on the modern foxhound, with the result that hardly any four-footed animal, certainly no domestic animal, combines in the same degree speed and lasting qualities. This is probably the result of a cross between the old southern hound and the greyhound, which combined the nose and tongue of the former with the speed of the latter. When the large woods began to disappear, and more 'blood' was used in our hunters, the pace of the hound was found to be still too slow. The foxhound continued to be bred for speed, until now we have a hound possessing a dash wholly unknown to the original foxhound, and capable of getting away from a large field of horses. The head of the foxhound should be large, deep through the muzzle, but without throatiness or heaviness; teeth, strong and even; shoulders, oblique and muscular; back, short and strong; legs, with great bone perfectly straight in front; hocks, well let down behind; feet, round with

arched toes; ears, naturally long and graceful, but always 'rounded' or shortened to prevent tearing when working in coverts; colour, white, with black or tan markings, sometimes to a great extent; height, 22 to 24 inches. In addition to the necessary amount of speed the foxhound must possess staying powers of a high order, a good nose, and be without a tendency to 'babble' or 'run muto'—i.e. to give tongue when not on a scent, or the opposite fault, to refuse to speak to a scent.

Foxhound.

In breeding a pack of foxhounds the individual hound must not be considered, but the speed of the whole pack must be increased or reduced as necessity demands, so as to have the whole pack hunting together.

**Foxhunting.** References to early foxhunting prove no more than that the fox was hunted, though in a manner vastly different from that which obtains at the present day. Of details there is a lack; it will therefore be sufficient to cite shortly a few excerpts from antiquity introductory to foxhunting as indulged in for amusement. To begin with, we find that William de Foxhunte looked after the six couple of foxhounds, William Blatherwick, two boys, and a horse to carry the nets, all of which constituted the foxhunting establishment of Edward I. In the *Records of the Chase*, 'Cecil' mentions an old treatise on hunting, ascribed to Edmund de Langley, one of the sons of Edward III., who began to reign in 1327, in which the 'fox' is enumerated as a beast of the chase. Richard II., whose reign commenced in 1377, granted permission, by charter, to the Abbot of Peterborough to hunt the fox; and at the beginning of his reign Henry IV. (1399-1413) confirmed to Henry de Popham in fee his lands at Farrington, and granted him leave to have his braches for taking hares and foxes in the county of Southampton. Up to this time, however, and for more than a couple of centuries later, the fox was not hunted in modern style; he was simply hunted for extermination, and was driven into nets, or run to ground and dug out; and in Gervase Markham's work, entitled *Country Contentment*, published in the year 1616, the fox is given only inferior rank as a beast to be hunted; while about 1639 Oliver St John, in a speech against Strafford, compared him to a fox, 'a beast of stinking flight,' whose death might be encompassed by any means, fair or foul. Soon after this period foxhunting appears to have attained to greater dignity, and, at least in some parts of England, to have become a distinct branch of sport. Theophilus, fourth Earl of Lincoln, who died in 1667, hunted round about Rotford; but his were no doubt staghounds, the change to foxhounds taking place at a later period. In the fifteenth volume of

the Sussex archaeological collections there appears at page 74 an account of the Charlton Hunt (now the Goodwood) in Sussex. According to Mr Bennett, the writer of the article, the Duke of Monmouth and Lord Grey kept a pack of foxhounds which were managed by Mr Roper, a native of Eltham in Kent, for some time prior to Monmouth's abortive attempt to seize the crown; and when that took place Mr Roper had to flee to France; whence he returned on the accession of King William III., by which time the hounds, the management of which he resumed, had become the property of the Duke of Bolton and himself. Mr Roper died in the hunting-field at the age of eighty-four, in the year 1715. The Duke of Bolton kept the hounds for a short time longer, and then made them over to the second Duke of Richmond, and they remained in the family till 1813 or 1815, when the fourth duke gave them to the Prince of Wales, and they became the royal staghounds. At what precise date the Charlton Hunt was established is not known, but it was obviously prior to 1689, the year of William III.'s accession. The Sinnington (Yorkshire) hounds are said to be the descendants of the Duke of Buckingham's pack, which hunted the old Hambleton country in 1686; while in 1698 Mr Boothby was hunting what is now the Quorn country. The Brocklesby (Lincolnshire) were founded in 1713, though it is evident that the packs which then amalgamated were in existence earlier. In 1720 Mr Bight was hunting the Badsworth country in Yorkshire; and in 1730 Mr Thomas Fownes of Stapleford, Dorset, hunted there, and eventually sold his pack to go into Yorkshire. The famous Belvoir pack was founded by the third Duke of Rutland about 1740; as early as 1750 Mr Noel must have had the Cottesmore; and in the same year Lord Spencer became first master of the Pytchley. Sir Thomas Gascoigne hunted a large district in Yorkshire, including what is now Lord Middleton's country, about the year 1762, and about that time the fifth Duke of Beaufort changed from staghound to foxhound. In the middle of the 18th century, too, foxhunting was carried on in the New Forest by Sir Philip Jennings; and in 1757 a certain Sir John Millar sold his hounds to the third Duke of Richmond, but in what part of England Sir John hunted cannot be discovered. Mr Gobsall had kennels at Bermondsey in 1750, and hunted a great deal of Surrey; while about the same time Mr John Elwes, the miser, kept hounds at Stoke, in Suffolk, and, in the exercise of the rigid economy which he always practised in connection with everything save the purchase of his horses, compelled his huntsman to discharge, in addition to the duties of the kennel, those of valet, cook, cowman, and farm-bailiff.

Of the details of the majority of the above-mentioned packs little is known beyond the fact that they existed. Occasionally passing mention is made of them in the papers of the date; and, if the master happened to be a man of more than ordinary note, his hunting establishment was mentioned in connection with his biography. Moreover, in early times hounds were kept in an unpretentious sort of way, and were probably deemed no more worthy of record than the possession of a brace of greyhounds or a small kennel of pointers or setters for shooting purposes. It was not until the first number of the *Sporting Magazine* made its appearance in October 1792 that a publication chiefly confined to sporting matters existed, and by that time foxhunting had increased in importance; there was scarcely a quarter of England at the close of the last century which was not hunted over, though the several countries were of far greater extent than at present. To give a few instances: the Brocklesby country at first took in not only that portion of Lincoln-

shire now hunted by Lord Yarborough's hounds, but the district afterwards occupied by the Bruton, Southwold, and Blankney as well. The Berkeley country extended from Bristol to London; the Cottesmore comprised a great deal more of Leicestershire than it does now; and the Duke of Beaufort hunted from Badminton to Chipping Norton, in Oxfordshire, where he had outlying kennels. Of the above-mentioned packs several have preserved an unbroken existence from the time of their foundation down to the present day. Among them are the Duke of Beaufort's, the Belvoir, the Cottesmore, the Brocklesby, Lord Middleton's, the Sinnington, the Badsworth, Quorn, Pytchley, New Forest, and Surrey; though in some cases the names under which they now figure on the list did not attach till a later period; while in other instances the change in the boundaries and extent of various hunts has been so great as to preclude us, on the score of accuracy, from saying that they ever had a common ancestor. It would be an injustice to the sporting spirit and liberality of masters past and present to omit mention of the fact that from the earliest times many packs have been kept up at the sole cost of the owner, the Duke of Beaufort's and the Belvoir standing out as special examples of generosity and unselfishness. Two Sir Watkin Wynns have found their friends and neighbours in gratuitous sport; and when the late Lord Middleton in 1861 found it necessary to ask the country-side to assist him with a subscription, he stated that his family had expended nearly £100,000 in maintaining the pack. The Blackmoor Vale is another hunt to which no one has been asked to subscribe, and the Fitzwilliam pack was for a long time kept up free of cost to its followers, just as Earl Fitzwilliam's are now. The majority of packs, however, are maintained by subscription, the money contributed being expended in the purchase and keep of horses, wages of hunt-servants, helpers, and kennel-men, keep of hounds, and, in hunts in which breeding is not carried out on a sufficiently large scale to maintain the strength of the kennel, in the purchase of hounds. Coverts are also rented, and the damage caused by foxes to poultry is made good; but for this purpose there is usually a special fund, called the 'poultry fund.' The cost of keeping up a pack of foxhounds in good style may be roughly set down at about as many times £600 as a pack hunts in a week—e.g. a two-days-a-week pack would cost about £1200; £1800 would be needed for one hunting three days a week, and so on. But no hard and fast line can be drawn, because in some hunts the above estimate is not reached, while in the maintenance of others it is largely exceeded.

The subdivision of countries, consequent upon the multiplication of packs of hounds, has necessarily enabled persons living at such places as Rugby, Cheltenham, Oxford, or Melton Mowbray to hunt with several packs of hounds; and, as pretty nearly every country has its good and bad side, the result often is that the same faces are seen out with each of the packs on the good days. Then again railways convey persons from convenient hunting centres and from towns at comparatively small cost, so that in one way and another fields sometimes attain to such proportions as to threaten sport and to cause infinite damage to those whose land is ridden over. In the Whaddon Chase Hunt (Mr Selby Lowndes's) it has long been the custom to expect every one coming out with the hounds to contribute at least £25; but so far as those living beyond the confines of the hunt are concerned the Essex were, it is believed, the first to legislate. In 1886 a rule was passed providing that every stranger should subscribe at

least 30 guineas to the funds; and in the course of the season 1888-89 the committees of the Bicester and Pytchley hunts enacted that all not living in those countries or in the immediate neighbourhood should subscribe a minimum of £25; and these examples will no doubt be largely adopted in the future in countries which attract strangers.

At the commencement of the season 1888-89 there were in England 154 packs of foxhounds; in Scotland, 9; and in Ireland, 17. Exclusive of those which had not been entered, there were 11,612 hounds in England, 584 in Scotland, and 1166 in Ireland; and the number of hunting fixtures in each week were: in England, 447; in Scotland, 25; and in Ireland, 44. If, then, each of these days be estimated to cost £600, as an approximate way of arriving at the total expenditure, it will be found that masters of hounds in England spend, roughly speaking, £268,200; in Scotland, £15,000; and in Ireland, £26,400. To these large sums must be added the amount expended on rent, stabling, horses, forage, harnessmakers, blacksmiths, and others by those who follow the different packs of hounds, and it will then be seen that fox-hunting causes the circulation of a great deal of money, while it also finds employment for a large number of men in the capacities of hunt-servants, feeders, and helpers in the stables.

When hunting first came to be regarded as an amusement for country gentlemen, the hounds met early in the morning, soon after daylight in fact, and found their fox by tracking him to his kennel by means of his 'drag'—that is to say, the line he had taken in the small hours of the morning on returning from his search after food; and this custom still obtains in some of the moorland countries like those of the Coniston and Border hunts, where hounds hunt over open ground, and where there are scarcely any regular coverts for foxes. In countries like these it might take two or three days to find a fox in the ordinary way; but as the pack traverse the open in the morning they generally come across the drag, which they hunt until they come up to their game. In more fashionable hunts, however, the hour of meeting is at 10.30 or 11 o'clock, and the hounds are at once taken to draw the various woods, spinneys, or gorses of the district, whither the fox will have retired after his night's prow. When he is found, the time which elapses before he 'goes away' depends partly upon the size of the covert, and partly upon his own inclinations. When, however, he does break covert he is allowed to travel some little distance before the whipper-in, or whoever may happen to see him, announces the fact by hallooing, the reason being that if he were not permitted to get some little way from the covert the noise would certainly cause him to turn back again. The huntsman and hounds with all speed make their way to the spot whence the halloo proceeded, and what subsequently happens is to a great extent a matter of chance. There are several circumstances which combine to bring about a bad run. The first is the absence of scent; and of the laws which govern scent we know no more to-day than our grandfathers did. It frequently happens that hounds will run well in the morning, and cannot, in foxhunting parlance, 'run a yard' in the afternoon, or *vice versa*; while sometimes scent fails suddenly in the course of a run. On days which appear highly favourable for hunting hounds are often unable to follow their fox; and, *per contra*, excellent runs are often enjoyed under what would seem to be highly adverse conditions. The poet who wrote 'a southerly wind and a cloudy sky proclaim a hunting morning' could not have been a practical foxhunter, as in almost every country in the United Kingdom sport is best when the wind has

some east in it. Secondly, the fox may 'run short,' as it is termed—that is to say, instead of at once making for some distant point, he may be ignorant of all except the country immediately surrounding the covert in which he was found, and may keep turning and twisting, with the result that the hounds are often baffled. Or, again, the fox may be headed and turned back into the months of the hounds; while another fruitful cause of bad sport is the overriding of the hounds by the field.

A hunting establishment comprises, in the first place, the master; or, if it be found impossible to induce one gentleman to undertake the duty, the hunt is managed by a committee. Next comes the huntsman, who may be either a professional or an amateur; in the latter case he is almost invariably the master. When an amateur hunts the hounds, the first whipper-in usually discharges the duties of kennel huntsman—that is to say, he supervises the management of the pack in kennel. Some packs have one whipper-in, others have two. With a few packs there is a third hunt-servant, whose duty commonly consists in riding the master's or huntsman's second horse. In addition to the above there are feeders, a stud-groom to supervise the stable, and the helpers who do their work under him. In former times an earth-stopper or two was on the strength of every hunt, but the modern practice is to delegate this duty to the gamekeepers on the different estates, and they are paid a stipulated sum, usually £1 or £1, 10s., for each fox found in the coverts of which they have charge; but this reward is forfeited should the fox get to ground in an earth or hole which ought to have been stopped. The earth-stopping takes place in the small hours of the morning, while the fox is abroad in quest of food. Notice is sent to the gamekeepers a few days in advance, and so much of the country is stopped as is considered likely to suffice for the day's draws. The time for earth-hunting varies in different countries, and is governed by the time of harvest. In the course of September, however, all packs make a commencement, and regular foxhunting dates from about the 1st of November. In some countries the season is prolonged into May, but in the majority of places the farmers are glad to see hounds confined to kennel after the end of March.

Although the United Kingdom is the chief home of foxhunting, the sport is followed with the utmost zeal in other quarters of the globe. In Montreal a pack have preserved an unbroken existence since 1826; in Manitoba Englishmen have introduced their favourite sport; and in Florida a new departure is taken by foxhunting by moonlight. At the Cape and in Bechuanaland packs of foxhounds have been established. In New Zealand is a pack which hunt foxes and run a drag; military enterprise has transplanted foxhunting to Alexandria and Cyprus; and wolf-hunting is pursued in Dakota. In India the Peshawar Vale hounds are as famous as the Quorn or the Belvoir in England; the Maharajah of Mysore devotes no little attention and money to the maintenance of a pack of hounds; the Outacannund hunt is a next-door neighbour; while the Dhariwal pack pursue the jackal.

See works by 'Nimrod' (1837; new ed. 1871); Radcliffe (1839; new ed. 1874); 'Scrutator' (1866); 'Stonehenge' (new ed. 1876); and that in the Bodmin Library on *Hunting* (1885), by the Duke of Beaufort and Mowbray Morris.

**Fox Indians**, a turbulent North American tribe of the Algonquin family, prominent in the wars of the 18th century, when its warriors sided alternately with the French and English. They also appeared as allies of the English in the war of 1812-14. A number new farm lands acquired by purchase in Iowa; but most of the tribe are settled, with the

kindred Sacs, on a reservation in Indian Territory, between the Canadian and Arkansas rivers.

**Fox Islands.** See ALIUTIAN ISLANDS.

**Fox River,** the name of two streams rising in Wisconsin. (1) The Fox River, or Pishtaka (220 miles), flows south to Aurora, then south-west to the Illinois, which it enters at Ottawa.—(2) The Fox River, or Neenah, after a tortuous but generally north-east course of about 250 miles, falls into Green Bay in Lake Michigan. It is divided into two sections by Lake Winnebago, the upper one being connected by a canal with the Wisconsin, so as to link together the Mississippi and the Great Lakes.

**Fox-shark,** or THRESHER (*Alopias vulpes*), the commonest of the larger sharks occasionally seen off British coasts. It is the only species of its genus, and is widely distributed in the Atlantic and Mediterranean, also occurring off California and New Zealand. It is much smaller than the basking shark (*Selache marina*), but attains a length of over 12 feet, of which half goes to the enormously elongated upper lobe of the tail, to the length and splashing activity of which the fish owes its names. The pectoral limb and the first dorsal fin are large; the snout is conical; the mouth and gill-apertures are moderately wide; the teeth are triangular and not serrated; the skin is bluish above, flesh-coloured below. The fox-shark follows

catching the public taste because of their handy size and suitability to the house, soon became the most popular breed of the day. The wire-haired fox-terrier was not exhibited in public until

Fox-terrier.

the year 1872, the breed having a class set apart for it at Glasgow in that year. As the coat of this variety of the fox-terrier requires some attention, especially when kept for exhibition, it is not so common as the smooth section, though rapidly increasing in popularity. The chief points of the fox-terrier are: head, long, flat, rather narrow, but with powerful jaws and teeth; ears, small, V-shaped, and drooping forward; nose, black; eyes, small; back, short and strong; tail, generally cut short, set on high, carried gaily; fore-legs—an important point—must be straight, showing no ankle, good bone; hind-legs, rather straight, with long and powerful thighs; feet, round with arched toes; colour, white with black or tan markings—a point of little importance; weight, not more than 17 lb.; coat, in the smooth variety, short, hard, and dense; in the rough variety it should be half-an-inch long, but without any silkiness. The expression of the fox-terrier should be keen and hard, full of life and fire. Though the fox-terrier should not be quarrelsome, he should be ready to face anything in the way of his legitimate work. He is unequalled as a companion; and, as many fox-terriers have been kept for generations merely as companions, soft and degenerate specimens of the breed are common. But a genuine fox-terrier is of a bright and cheerful disposition, a splendid vermin-killer, fast enough to hunt, and small enough to enter an earth. See R. B. Lee, *History of the Fox-terrier* (1889).

**Foy, MAXIMILIEN SÉBASTIEN**, French general, was born at Ham, 3d February 1775. During the early wars of the Revolutionary period he served as an artillery officer in Belgium, and on the Moselle and Rhine, till by 1800 he had risen to the rank of adjutant-general. In 1801 he commanded a brigade during the Italian campaign, and in 1805 a division of artillery in the Austrian campaign. Two years later Napoleon sent him to Turkey to assist Sultan Selim against the Russians and British, and his defence of the Dardanelles obliged Duckworth, the British admiral, to retire with loss. From 1808 to 1812 he commanded, as brigade-general, in Portugal and Spain, and was present at all the battles of the Pyrenees, being dangerously wounded at Orthez in 1814. In 1815 he was again wounded at Waterloo, where he commanded a division under Ney. In 1819 he was elected deputy by the department of Aisne. In the chamber he was the constant advocate of constitutional liberty, and distinguished himself particularly by his eloquence in opposing

Fox-shark (*Alopias vulpes*).

shoals of herrings, pilchards, and the like, threshing the water with its tail as it swims round its victims, which it destroys in great numbers. In spite of its size it is not dangerous to man, and Günther says that stories of its attacking large Cetaceans are erroneous. The flesh is said to have a salmon flavour. See SHARK.

**Foxtail Grass** (*Alopecurus*), a genus of Grasses, of which some species are much valued, particularly the Meadow Foxtail Grass (*A. pratensis*). This is one of the best meadow and pasture grasses of Britain, but does not arrive at full perfection till the third year after it is sown. It bears mowing well, and is reckoned a good grass for lawns. This, with Sweet Vernal Grass, is the earliest of British meadow grasses; it bears drought well, and thrives under trees. The Jointed Foxtail Grass (*A. geniculatus*), with an ascending culm bent at the joints, is very common in moist places, and cattle are fond of it, but it is a small grass. The Slender Foxtail Grass (*A. agrestis*) is an annual or biennial, of little value, although occasionally sown on very light sandy soils. See GRASSES, PASTURE.

**Fox-terrier.** The origin of the fox-terrier is somewhat obscure. From the earliest days of hunting a small dog has been used to follow the fox to its earth, but it is difficult to say when this dog became identical with the modern fox-terrier. The terriers which ran with hounds until the middle of the century were of all colours and coats; their owners, acting on the adage 'handsome is as handsome does,' bred solely for work and not for appearances. The white terrier with hound marking being found most suitable, it was bred with care, and became a distinct breed. Some smooth fox-terriers were exhibited about the year 1863, and, speedily

the war against Spain in 1823. Foy died at Paris, November 28, 1825. Madame Foy published in 1827, from her husband's papers, a *Histoire de la Guerre de la Péninsule*. In the previous year appeared his *Discours*, with a biography by Tissot.

**Foyers**, a stream of Inverness-shire, running 9 miles northward and falling into the east side of Loch Ness, nearly opposite Mealfourvie and 10½ miles NE. of Fort Augustus. During the last 1½ mile of its course it makes a total descent of 400 feet, and forms two magnificent cascades, 40 and 165 feet high. The lower, called specially *The Fall of Foyers*, is one of the finest in Britain.

**Foyle**, LOUGH, an inlet of the Atlantic, on the north coast of Ireland, between the counties of Londonderry and Donegal. It is 15 miles long, 1 mile wide at its entrance, and 10 miles broad along its south side; but a great part is dry at low water, and its west side alone is navigable. Vessels of 600 tons ascend the lough, and, as far as Derry, its principal tributary the Foyle, which, formed near Lifford by the confluence of the Finn and the Mourne, has a north-north-easterly course of 72 miles.

**Fra Angelico**. See ANGELICO.

**Fra Bartolommeo**. See BARTOLOMMEO.

**Fracas'toro**, GIROLAMO, an Italian physician and poet, famous for the universality of his learning, was born at Verona in 1483. At the age of nineteen he was appointed professor of Logic in the university of Padua. He afterwards practised successfully as a physician, and it was by his advice that the Council of Trent moved from Trent to Bologna to avoid the plague. Some years before his death, which occurred at Casti, near Verona, on 8th August 1553, Fracas'toro abandoned medicine for letters, and became intimate with some of the leading scholars of the age. The chief of his numerous writings are: *Symphylidis, sive de Morbo Gallico, Libri Tres* (1530; Lond. 1720); *De Vini Temperatura* (1534); *Homocentricorum sive de Stellis Liber* (1535); and *De Sympathia et Antipathia Rerum* (1546). His collected works appeared at Venice in 1555, and his practical works at Padua in 1728.

**Fraction**. In Arithmetic, when a unit of any kind is divided into any number of parts, each is termed a *fraction* of the whole unit—e.g. one foot (linear measure) is divided into inches; one inch is thus a fraction of one foot. The usual notation employed to denote the value of a fractional quantity is to place under a horizontal line the number of equal parts into which the whole unit has been divided; above the line is placed the number of these parts actually contained by the fraction. The former number is known as the denominator, the latter as the numerator of the fraction. Thus, 7 inches is expressed as the fraction of one foot by  $\frac{7}{12}$ . Quantities expressed in this way are termed vulgar fractions; they are *proper* or *improper* according as the numerator is less or greater than the denominator; and when the numerator and denominator have no common factor the fraction is said to be in its lowest terms. When the denominator is 10, or a power of 10, the quantity is termed a Decimal Fraction (q.v.). In Algebra the term fraction, while including the sense of the arithmetical definition, is generally used to mean that any quantity affected by it is to be multiplied by the numerator and divided by the denominator. The addition, subtraction, multiplication, and division of fractions are performed according to rules which are practically the same both in arithmetic and algebra. Such rules will be found in any competent text-book on these subjects.

*Continued Fractions*.—Any expression of the form  $a + \frac{1}{b + \frac{1}{c + \frac{1}{d + \text{&c.}}}}$  is termed a *continued*

*fraction*. This expression is usually for convenience abbreviated to  $a + \frac{1}{b + \frac{1}{c + \frac{1}{d + \text{&c.}}}}$ , &c. Such fractions may be terminating or non-terminating. A series of quantities which successively approach towards the actual value of such a quantity are termed *successive convergents* to the value of the fraction; they are alternately smaller and greater than its actual value. Such a series for the fraction above given is:  $a$ ,  $a + \frac{1}{b}$ ,  $a + \frac{1}{b + \frac{1}{c}}$ , &c.

*Vanishing Fractions*.—When, by giving to one of the terms in a fractional algebraical expression a particular value, both the numerator and denominator become zero, the expression is said to be a *vanishing fraction*. Such is the case in the quantity  $\frac{x^2 - 1}{x - 1}$ , when  $x = 1$ ; and in  $\frac{x}{\sqrt{a+x} - \sqrt{a-x}}$ , when  $x = 0$ . But in the first case, by dividing both numerator and denominator by  $x - 1$ , the true value of the expression is  $x + 1$ , which is equal to 2 when  $x = 1$ . In the second example, by multiplying above and below by the complementary surd—viz.  $\sqrt{a+x} + \sqrt{a-x}$ , the fraction becomes equal to  $\sqrt{a}$ , when  $x = 0$ . Such methods for finding the true value of vanishing fractions are all more or less tentative. For a general process by which their value may be found, reference may be made to Williamson's *Differential Calculus*, chap. iv. See also article CALCULUS.

**Fractures**, in Surgery, are classified in several different ways. As regards the fractured bone itself, it may be merely broken across, either transversely or obliquely, the commonest injury; or broken into several pieces (*comminuted fracture*); or only cracked ( *fissured fracture*, the most usual fracture of the skull); or partly broken, partly bent (*greenstick fracture*, occurring in the bones of the limbs in children); or one part of the bone may be forcibly driven into the other (*impacted fracture*). But the most important classification of fractures is concerned with their relation to the surrounding parts. In a *simple fracture* there is no wound of the skin communicating with the fracture; in a *compound fracture* there is such a wound; in a *complicated fracture* there is some other injury (e.g. a flesh-wound not communicating with the fracture, a dislocation, a rupture of a large blood-vessel). The distinction between simple and compound fractures is of special importance, as the latter are very much more serious than the former, chiefly on account of the risk of pyæmia or septicæmia, and their repair much more tedious; though the dangers attending them have much diminished since the introduction of the antiseptic method. See ANTISEPTIC SURGERY.

Fractures are most common in the long bones of the limbs, particularly the collar-bone, the radius just above the wrist, the thigh-bone, and the fibula. They are rather less frequent in children than in adults, and much less in women than in men.

*Causes of Fractures*.—The *predisposing* causes which render bones specially liable to fracture may be local—e.g. necrosis or tumour affecting a single bone, or general—e.g. cancerous cachexia, the diseases called mollities and fragilitas ossium, and old age, all which render the bones generally less able to bear a strain. There is one predisposing

cause to fracture fortunately now but seldom seen—viz. scurvy. Not only did it make the bones brittle, but, as was seen in Lord Anson's expedition, which was manned chiefly by pensioners, old fractures again became disunited. The *immediate* cause may be either *external violence* or *muscular action*. The external violence producing a fracture may be either *direct* or *indirect*. In the former case the bone yields at the point where the force is applied, and there is always more or less bruising of the adjacent soft parts by the body which causes the fracture—e.g. when a limb is broken by a heavy wheel passing over it, or a stone falling upon it. In the latter case the bone gives way at some point between two opposing forces, and the adjacent tissues are not injured except by the broken ends of the bone—e.g. when a person falls upon his hand, and the radius or humerus gives way. The worst fractures are thus in general those produced by direct violence. Muscular action not unfrequently leads to the fracture of bones into which powerful muscles are inserted, particularly the kneecap, by simply tearing them asunder. The subject of the injury may then fall, and attribute the accident to the fall, whereas the reverse is the case. A medical man some years ago awoke with a fit of cramp, and almost immediately his left thigh-bone broke with a snap. It reunited in the usual time.

*Symptoms of Fracture.*—Fracture of a limb is attended by pain, swelling, and loss of power; but these do not suffice to distinguish it from other forms of injury. Deformity other than swelling (shortening, angling, or unnatural rotation of the injured limb), abnormal mobility at the seat of injury, and a rough grating sound and feeling (called *crepitus*) when the limb is so moved as to rub the broken surfaces together are the most satisfactory evidences of fracture. The patient, moreover, may have observed the sound of the break when the bone gave way. But in a case where fracture is suspected the investigation of it should be deferred till the patient has been placed where he is to be treated.

*Repair of a Broken Bone.*—The immediate result of a fracture is considerable extravasation of blood into the tissues around it, from the blood-vessels torn across by the injury. It is not quite certain whether some of this blood takes part in the healing process; most of it at all events is simply absorbed. But during the days following the fracture slight inflammation (q.v.) of the wounded tissues takes place, and inflammatory lymph (here called *callus*) is thrown out between and around the broken ends of the bone. Slow organisation of the callus takes place, and in from three to six weeks it is usually converted into bone, firmly cementing the fragments together. In man, when the fracture is set in good position, there is generally little more lymph effused than suffices to restore the natural outline of the bone; but in animals the break is generally ensheathed in a large mass of it, called *provisional callus*, which steadies the bone till the *permanent callus* between the ends of the bones has become ossified; then the provisional callus, being no longer necessary, is absorbed.

*Treatment of Fracture.*—When a fracture has taken place it is important that there should be as little disturbance as possible of the injured part till it is to be finally adjusted by the surgeon. Many simple fractures, especially of the lower limb, are made compound by ignorance or carelessness on the part of the injured person or of officious onlookers. The injury should therefore be attended to first on the spot where it has been received; the limb should be fixed by handkerchiefs or strips of cloth to anything at hand firm enough to keep it temporarily steady (a walking-stick, rifle, broom-

handle, &c.), or, in the case of the lower limb, to the other leg. When this has been done the patient may more safely be removed to the place where he is to remain during treatment.

The object of the surgeon in *setting* a fractured limb is to place the fragments as nearly as possible in their natural relation, and to retain them firmly in this position during healing. The first end is attained by extending the broken limb and moulding it with the hands; the second is opposed by the action of the muscles of the part which, pricked by the broken ends of bone and stimulated into painful spasms, tend to restore the deformity. Their action must be counteracted by the adjustment of some form of *splint* or external rigid apparatus to the limb, differing in material, shape, and method of application according to the seat of the fracture. Splints are usually made of wood, pasteboard, or gutta-percha, and fixed on by straps or bandages; but in some simple fractures, especially of the lower limb, it has been found sufficient to encase the injured limb in a bandage impregnated with some material which will harden on drying and form a shell for it (starch, salicylate of soda or 'water-glass,' plaster of Paris); in this way the patient's confinement to bed may be much shortened.

Treatment of fractures may lead to an unsatisfactory result in either of two contrary ways: when the vitality is low, or the treatment has not secured perfect rest of the broken bone, it may become united merely by fibrous tissue instead of bone, leaving a flail-like useless limb (*united fracture*, or false joint); or, when rest has been too long and continuous, the healing process may not merely reunite the bone, but fix the surrounding tendons and ligaments by fibrous adhesions, leaving more or less obstinate stiffness of the neighbouring joints. The former is in general more apt to occur in the shafts of the long bones, the latter close to their ends, and the treatment must be modified accordingly.

Fractures of the bones of the head and trunk are dangerous more on account of the risk of laceration of the important organs enclosed by them than because of the injury to the bones themselves; and in general any attempt to 'set' such fractures is apt to do more harm than good. Means must simply be taken to keep them as much at rest as possible.

**Fra Diavolo**, properly MICHELE PEZZA, a celebrated Italian brigand and renegade monk, born at Itri, in the Terra di Lavoro, in 1760. Of plebeian origin, he at first followed the trade of stocking-weaver, then entered the Neapolitan army, and subsequently the service of the pope; finally he abandoned military life and became a monk, but, being expelled for misconduct, withdrew to the mountains of Calabria, where he headed a band of desperadoes, whose strongholds lay chiefly along the frontier of the Terra di Lavoro. Pillage, bloodshed, and atrocious cruelties signalled his career. For years he evaded the pursuit of justice by retreating to his haunts amidst mountains and forests, and skilfully defeating, with much inferior numbers, all the armed forces despatched against him. He became at length known among the peasantry of the neighbourhood as Fra Diavolo. On the advance of the French into the Neapolitan states, along with his band he warmly espoused the royal cause, and in return they were not only pardoned and reinstated in civil rights, but promoted to the grade of officers in the royal army, Fra Diavolo himself becoming colonel. In 1806 he attempted to excite Calabria against the French, but was taken prisoner at San Severino, and was executed at Naples on the 12th November. The opera of Auber has nothing in common with Fra Diavolo but the name.

**Fraga**, a town of Spain, on the Cinca, 63 miles ESE. of Saragossa, the centre of a district famous for a variety of small green figs, which are dried before being consumed. Here, in 1134, the Moors defeated Alfonso I. of Aragon. Pop. 6761.

**Fragaria**. See STRAWBERRY.

**Fragonard**, JEAN HONORÉ, painter, was born at Grasse in 1732. He studied under Chardin and Boucher; and, entering the academy schools, gained the 'prix de Rome' in 1752. In Italy—which, later, he revisited—he was influenced mainly by the works of Tiepolo, the last of the great Venetians; and he executed many illustrations for Saint-Non's *Voyage de Naples et de Sicile*. Returning to France, he in 1765 received 2400 francs from Louis XV. for his 'Collirio', commissioned for reproduction in Gobelins tapestry; then he ceased to be academic, and began to be personal, to follow his true bent—helped to be most himself by the art of Venice and by the art of Rubens. He painted, with a loose touch and insouciant colouring, *genre* pictures of contemporary life, or of scenes which, however titled, drew their inspiration from present actuality, from humanity seen and observed by the painter himself. To these his ardent and sensuous southern temperament gave both force and charm. He is also known by his landscapes. He is well represented in the Louvre, most typically in its 'La Caze' collection by such works as 'Dacchante Endormie' and 'La Chemise Enlevée.' He died in Paris, 22d August 1806.

**Fraboesia**. See YAWS.

**Frame**, in Gardening, a term usually applied to movable structures used for the cultivation or the sheltering of plants. The most common form is that of the ordinary hotbed frame, which is a rectangular box of any convenient dimensions covered with glazed sashes; but they are made in many forms, according to fancy and the purpose for which they are particularly required.

**Framingham**, a post-village of Massachusetts, on the Sudbury River, 24 miles W. by S. of Boston by rail. The township includes Saxonville and South Framingham, with manufactures of blankets and straw goods. Pop. (1885) 8275.

**Framlingham** ('strangers' town'), a market-town of Suffolk, 22 miles NNE. of Ipswich by a branch line. It consists of a spacious market-place, with a few streets branching off irregularly. The fine flint-work church, restored in 1838-39, has a tower 90 feet high, and contains several noble altartombs of the Howards (the third Duke of Norfolk, the poet Earl of Surrey, &c.). Separated by the Mere from the red-brick Albert middle-class college (1864) rises the great Edwardian castle, reduced in 1650 to a mere shell, but retaining its thirteen square towers. The stronghold successively of Bigods, Mowbrays, and Howards, it was Queen Mary's refuge after Edward VI.'s death. Pop. 2518. See Hawes's *History of Framlingham* (1798).

**Franc**, a French silver coin which forms the unit of the French monetary system. Introduced into France 6th May 1790, it was extended to the other countries comprised in the Latin union—viz. Belgium, Italy, and Switzerland by the convention of 1865, and has since then been adopted by Rumania (1868), Spain (1871), Servia (1874), Bulgaria (1880), and Greece (1882). In Belgium and Switzerland the coin is known as the franc; in Italy, *lira*; in Greece, *drachma*; in Rumania, *lei*; in Servia, *dinar*; and in Spain, *peseta*. The franc is coined of silver,  $\frac{835}{1000}$  fine, and weighs five grammes, its value being about 9½d. English money, or 19 cents of United States. One pound sterling = 25.2 francs. The franc is divided into 100 centimes, but the old division into 20 sous,

valued at 5 centimes each, is still made use of in common life. There are in France silver coins of  $\frac{1}{2}$ ,  $\frac{1}{3}$ , 1, 2, and 5 francs; and gold pieces of 5, 10, 20, 50, and 100 francs. See DECIMAL SYSTEM.

**Francavilla**, a town in the Italian province of Lecce, lies 23 miles WSW. of Brindisi. It has tanning, cloth-weaving, and trade in wine and oil. Pop. (1881) 17,550.

**France**, the most westerly portion of Europe, occupies a most advantageous position between the Atlantic Ocean and the Mediterranean Sea. The civilisation developed on the coasts of the Mediterranean eventually found an easy passage towards the Atlantic and the North Sea by the broad valley of the Rhone and Saône, which communicates with the drainage areas of the Seine, the Loire, and the Garonne. The territory now occupied by France thus became the ground upon which Roman civilisation met and melted with the civilisation of the Celts and Pictons; and it gave birth to a race which assimilated a variety of ethnographical elements—Gaulish, Italian, Spanish, German, and Flemish—and developed into a powerful nationality, the French.

In its present limits, diminished in 1871 by the loss of Alsace and part of Lorraine (5590 sq. m., 1,600,000 inhabitants), France covers an area of 204,092 sq. m.—i.e. one-nineteenth part of Europe, and has a population of over 38,000,000 (one-eighth of the population of Europe). It is bounded on the N. by the Channel and the Strait of Dover, which separate it from England; on the NE. by Belgium and the grand-duchy of Luxembourg; on the E. by Lorraine, Alsace, Switzerland, and Italy; on the S. by the Mediterranean Sea and Spain, from which it is separated by the Pyrenees; and on the W. by the Atlantic Ocean. Its utmost extremities are comprised between 51° 5' and 42° 20' N. lat., and the longitudes of 4° 42' W. and 7° 39' E. In shape it is a compact hexagonal mass, symmetrically distributed on both sides of the meridian of Paris, its greatest dimensions being 606 miles from N. to S., 556 miles from W. to E., and 675 miles from NW. to SE.

The areas of the different administrative subdivisions of France, and their populations, as well as the former divisions into provinces, are given in the table on the next page.

**Coasts, Seaports, and Islands.**—The coasts of France possess great advantages for maritime intercourse with the world. The eastern part of the Mediterranean coast, owing to its crescent-shaped indentations, has several excellent harbours which combine the advantage of being situated at, or close by, the terminus of the great commercial route connecting north-west Europe with the Mediterranean (Golfe de St Tropez, Hyères roads, Toulon, Marseilles); on the other hand, the western portion of the same coast, which describes a broad curve in the Gulf of the Lion, is flat and difficult of access, as are also the shores of the Bay of Biscay in the Atlantic. The deep estuary of the Garonne has a good port in Bordeaux; for Nantes, at the head of the estuary of the Loire, owing to the shallowness of its entrance, a deeper port has been found in St Nazaire; whilst the port of La Palisse, three miles west of La Rochelle, is steadily rising in importance. Further north the rocky coasts of Brittany are indented with numerous narrow gulfs, and dotted with small islands; and Brest, situated on one of the gulfs, is among the best ports in Europe. On the northern coast, facing towards England, France has but few natural harbours. Cherbourg, at the extremity of the Cotentin peninsula, has been made a naval port at a heavy outlay. Le Havre, at the mouth of the Seine, also is an artificial port, whose maritime intercourse with distant lands

is growing rapidly—as is likewise that of Dunkirk. Boulogne and Calais derive their importance from their close and extensive intercourse with England.

Except the island of Corsica, which, geographically and ethnologically, belongs rather to Italy, France has no islands of importance. The islands off the Mediterranean coast, as well as those off Brittany, are practically but small detached fragments of the mainland; while the Channel Islands (q.v.), situated between Brittany and the Cotentin peninsula, belong to Great Britain. The aggregate area of the French islands is 3686 sq. m.

**Colonies.**—The possessions of France outside of Europe, both colonies and protected countries, cover an aggregate of 1,195,091 sq. m., and have a population of more than 32,000,000 inhabitants. Of them, Algeria (q.v.) is rapidly becoming a part of France proper, and is considered as such for nearly all administrative purposes. The large territory of Tunis has recently been taken under French protection. Moreover, by a treaty signed in 1885 Madagascar was virtually placed under the protection of France, which also claims the protectorate of a considerable area in West Africa, along the Ogway and its tributaries, and in 1884 reoccupied portions of the Gold Coast. In Asia, Tonkin was annexed to France in 1884, and Annam placed under its protectorate. The whole of the French possessions in Asia are now united into the governorship of Indo-China. In 1887 the French protectorate was extended in the Pacific Ocean to the Wallis Islands, west of Samoa, and to Raiatea, in the neighbourhood of Tahiti. The details of the French colonies are given in the subjoined table, although some of the figures are necessarily only estimates.

| I. COLONIES.                                | Area in sq. miles | Pop 1896      |

**Geographical Description.**—A general idea of the leading geographical features of France can be given in a few words. Its territory embodies highlands in the south and south-east only: in the south it comprises the northern slopes of the Pyrenees, and towards the south-east frontier part of the Alps. The remainder of the territory is nearly equally divided between extensive lowlands in the north-west and a great plateau, which covers the south-eastern half, but is separated

from the Alps by the broad and deep valley of the Lower Rhone. The climate of France, its vegetation, the distribution of its population, and its very history have been determined by these leading features of its orography.

*The Plateau.*—The extensive mass of elevated plains which rises between the lowlands of the Mediterranean coast and those sloping towards the Atlantic reaches a height of from 3000 to 4000 feet in its higher central parts only; several chains, partly of volcanic origin, piled over its surface, attain from 5000 to 6000 feet; while the river-valleys are dug so deeply into the plateau that it often assumes a hilly aspect. The whole slopes gently towards the north-west, gradually melting into the lowlands of the Garonne, the Loire, and the Seine, which would be submerged almost entirely if the level of the ocean rose 1000, or even 660 feet. In that case the coast-line of the Atlantic would run from the Bay of Biscay towards Belgium, with some detached islands to the north of this line, and to the south of it two broad and deep gulfs, which would correspond to what are now the upper drainage areas of the Garonne and the Loire; while the Mediterranean Sea would send into the mainland a long and wide gulf up the valley of the Rhone, with a narrow elongated lake penetrating further north, and corresponding to what is now the valley of the Saône.

It is easy to grasp at once how such a configuration facilitated the intercourse between the Mediterranean Sea and the Atlantic Ocean. The shores of the Gulf of the Lion, which at an early period of history were dotted with Greek and Roman cities, are separated from the Garonne by only a low watershed, the *Saill-de-Narbonne* (810 feet above the sea), which allows easy communication with the Bay of Biscay. Farther north the depression of the Saône, which is a natural continuation of the valley of the Rhone, is connected with the Loire by a valley of so gentle a gradient that it has been utilised for a canal (the Canal du Centre), the highest part of the watershed being but 1000 feet above the sea; and, finally, the same depression of the Saône freely communicates across the lower parts of the plateau with the tributaries of the Seine. The civilisation which developed on the littoral of the Mediterranean thus found three natural passages leading to the Atlantic Ocean and the coasts of the North Sea, without having to contend with any of the natural obstacles opposed elsewhere by the Alps.

While sloping gently towards the north-west, the plateau has a short steep slope towards the valley of the Rhone and the Mediterranean coast, and the southern part of that slope is fringed by the Cévennes Mountains, which raise their granitic and crystalline summits to more than 5000 feet above the sea (chief summit, *Mont Mézenc*, 5754 feet). This lofty chain separates two entirely different worlds—the fertile, sunny, and warm plains of the Lower Rhone and Languedoc from the plains of the Rouergue, dreary, cold, and 3000 feet high, upon which only rye is grown, and flocks of sheep find rich grazing-grounds. Farther north the mountains on the edge of the plateau become much lower. The *Monts du Vivarais* reach their greatest height in *Mont Pilat* (4703 feet), while the *Monts du Beaujolais* and *du Charolais* as a rule do not exceed 3300 feet. The sunny slopes of the *Monts du Beaujolais*, turned towards the Saône, are covered with rich vineyards; while the plateau to the west of them is dotted with ironworks, coal-mines, and manufacturing cities. Still farther north the plateau, which is separated by only the narrow valleys of the Saône and the Doubs from the hills of the Jura, is fringed by the low dome-shaped hills of the Côte-d'Or (2000 feet),

which connect it with the Vosges. The upper tributaries of the Seine have their source in the same wet district as those of the Saône, and both rivers are connected by the Burgundy Canal. Finally, the Vosges, although making a steep descent to the valley of the Rhine, rise but gently over the plateau, their highest points being not more than from 3300 to 4000 feet above the sea (the *Ballon de Soultz*, 4579 feet, is now on German territory). Thick forests still clothe their slopes, which are covered with morainic deposits of the glacial period, and their numberless streams are dotted with sawmills and factories.

The plateau reaches its greatest height of from 3300 to 4000 feet in central France—in the *Massif Central* of Auvergne, which covers nearly one-seventh of France's total area, and is a region of granites, gneisses, and crystalline slates fringed by Jurassic deposits, and dotted on its surface with extinct volcanic cones surrounded by wide sheets of lava. The *Massif du Cantal*, connected by the *Margeride* chain with the Cévennes, rises nearly 2000 feet above the level of the plateau, reaching 6093 feet above the sea in its highest volcanic cone, the *Plomb du Cantal*. The *Monts Dore*, 40 miles north, have the same character; their chief summit, the *Puy-de-Sancy* (6188 feet), surrounded by several lower volcanic cones, being the highest mountain of central France. Finally, the *Monts Dôme*, a few miles further north, consist of some fifty volcanic cones, the highest of which is *Puy-de-Dôme* (4806 feet). The *Limousin* and the *Marche*, to the west of the above, are granitic plateaus hardly reaching 3300 feet above the sea; while the *Causse* of the Rouergue, in the south, are built up of Jurassic limestones deeply cut into by rivers which flow in beautiful cañons; towards the north-east the *Massif Central* is continued by the *Morvan*, and, farther north-east, by the much lower plateaus of western Lorraine and Champagne *Pouilleuse*, which slope with a very easy gradient towards the plains watered by the Seine. As to the Ardennes (between the Meuse and the Moselle), which have played so important a part in military history as a bulwark against foreign invasions, they are a plateau from 1600 to 2400 feet high, still covered with wide forests, and intersected by marshy depressions, ravines, and fertile valleys. The heights of the *Massif Central*, suffering as they do from a protracted winter, have but a poor, rapidly-diminishing population. The forests which once covered them have mostly been destroyed, save in the picturesque *Margeride* chain, and only flocks of sheep graze on their meagre pasture-grounds. The *Causse* receive rain in abundance, but are exceedingly dry—the water rapidly disappearing in the numberless crevices of the soil. The inhabitants are thus compelled to gather rain-water in cisterns for themselves and their cattle. A few acres, cultivated here and there, bear poor crops of barley, oats, and potatoes; but hundreds of thousands of sheep are kept for the special purpose of making cheese. As a rule the plateau is thinly peopled, save in the mining and industrial regions. Farther north-east, where it is much lower, and where the broad valleys between the wooded hills have a more fertile soil, a denser population gathers in the villages and the towns, and finds the means of existence in agriculture combined with a variety of small industries.

*The Jura.*—A narrow passage near Belfort (la *Trenée* de Belfort), utilised by both the canal which connects the Saône with the Rhine and the railway which leads from Paris to Switzerland, separates the Vosges from the limestone plateaus of the Jura, part of which belongs to France. The depressions and high valleys between the forest-clad hills shelter a large and laborious population, which

is supported by a combination of agriculture and cattle-breeding with a variety of petty trades.

*The Alps.*—Since the annexation of Savoy in 1860 the Alps of Savoy, as well as a portion of the main chain, including the northern slopes of the chain of Mont Blanc (15,780 feet), belong to France. The pass of Little St Bernard (7190) separates the latter from the Graian Alps, which have the two passes of Mont Cenis (6883) and Mont Genève (6802) leading from France to Italy, and are continued to the south-west by the Oisans group, where immense glaciers rivaling those of Switzerland gather around Mont Pelvoux (13,462). The valley of the Durance separates the Graian Alps from another short parallel chain of the Cottian Alps (Monte Viso, 12,608), while the still lower Maritime Alps descend in terraces to the Mediterranean coast. The cold and snowy slopes of the Alps are but thinly peopled, especially in the dry limestone spurs of the Graian and Cottian Alps. A number of agricultural villages, however, thrive in the lower spurs of the Savoy Alps, and the city of Grenoble is an industrial centre of importance; while Chamouni at the foot of Mont Blanc is one of the chief centres for tourists.

*The Pyrenees.*—This wild complex of lofty chains extends for a length of 260 miles between the Atlantic Ocean and the Mediterranean Sea. In the east it is built up of three parallel chains running in a north-eastern direction: the Monts Albères, the Sierra del Cadí, which enters France from Spain and has on French territory the lofty peak Mont Canigon (9137 feet), and the chain of south-east Andorra, continued in France by the peaks Puy-de-Carlitte (10,203) and Madres. Farther west the Pyrenees proper consist of at least two parallel chains of the wildest aspect, both running west-north-west and disposed in *échelons*. Here we find the highest peaks of the Pyrenees: Nethon (11,168) in the Maladetta chain, the Mont Perdu, and several others rising to heights over 10,000 feet. Wide *cirques*, which formerly were filled with *nevés* and gave origin to vast glaciers, and arid mountains intersected by narrow and dark valleys are characteristic of that part of the Pyrenees; but the Pyrenean glaciers of our own time are much inferior to those of the Alps and none descend lower than 7260 feet. The Pass of Roncervaux (Ronces-valles, 40 miles from the Atlantic coast), which has been the route of so many migrations, separates the Pyrenees proper from a series of much lower spurs of the Spanish coast-ridges, which, like the Mediterranean coast-ridges, also have a north-eastern direction. The passes across the Pyrenees proper are very few, very high, and difficult. The Pass of Roncervaux in the west and those of La Perche and Pertus in the east (16 miles only from the Mediterranean) lead through longitudinal valleys of the chains running north-east which enclose the Pyrenees at both ends. Of the passes through the Pyrenees proper none is lower than 6700 feet. Therefore the railways connecting France with Spain have been compelled to follow the very coasts of the Atlantic Ocean and the Mediterranean Sea, while the other lines stop short on both slopes of the Pyrenees proper without yet venturing to cross them. A plateau, from 1600 to 2000 feet high (Lannemezan), spreads out at the northern foot of the Pyrenees. Owing to its limestone soil it is exceedingly dry, and its grazing-lands have had to be irrigated with water derived from the Neste River.

*Plains and Rivers.*—The whole of north-western France, with the exception of a few hilly tracts in La Vendée, Brittany, and Normandy, is occupied by wide plains which constitute the real wealth of her territory. Taking them in order from the south-west, we have first the Landes—a wide

triangular space between the Bay of Biscay, the Adour, and the Loire, covered with Pliocene sands, which would be an immense marshy fever-den, bordered by shifting sands on the sea-coast, if it were not intersected by canals, and the sands were not fixed by plantations of trees. The thick growths of bushes which cover the plain are utilised as grazing-grounds for flocks of sheep, the shepherds formerly being compelled to mount upon stilts when watching their flocks. Some of the ponds—formerly bays, now separated by sand-dunes from the ocean—are valuable fishing-grounds. The Adour (187 miles long), which fringes the Landes and receives a number of tributaries (*gaves*) from the chalky plateau of Lannemezan, has but few important cities on its course—Bayonne being the chief of them. The Garonne (346 miles), which rises in Spain, and receives the Tam and the Aveyron from the very depths of the Massif Central, is a most important channel for navigation. But the torrential rains which pour over its drainage area of 22,080 sq. m. do not always find an easy outlet in its channel, and floods are not unfrequent. The Dordogne (305 miles), which rises in the Mont Dore, has most of its course dug into the plateau. Beautiful vineyards cover the slopes of its valley, while lower down the raising of iron ore and the quarrying of grinding-stones, as also the industry of truffle-hunting in Périgord, become a source of prosperity; the old city of Périgueux is an important centre of manufactures. The Dordogne and the Garonne join to form the Gironde, which is a true marine estuary, with the left bank bordered by the low hills of Médoc, covered with vineyards yielding every year not less than 2,200,000 gallons of the finest wines. The great port of Bordeaux, on the Garonne, is some 15 miles above the head of the estuary of the Gironde.

The monotony of the rich plains between the Gironde and the Loire, which include the old province of Poitou, is broken by the dreary hills of the Gâtine, a link between the chains of Margeride and Limousin and the hilly tracts of Brittany. The southern parts of the plains on the right bank of the Gironde—the Saintonge (watered by the Charente)—are among the richest districts of France. Farther north the Bocage closely reminds one of England by its meadows enclosed within rows of trees, while Le Marais, on the coasts of the Gulf of Poitou, which has the two islands of Ré and Oléron, protecting the entrance to Rochefort, resembles the *polders* of the Netherlands.

Next we have the immense plains watered by the Loire, which becomes a great river after receiving the Allier, and has a drainage area covering one-fifth of the area of France (46,750 sq. m.; 7,000,000 inhabitants), and a total length of 670 miles. This chief river of France rises on the plateau not far to the west of the middle of the Rhone's lower course, and describes a wide curve towards the north, approaching within 70 miles of Paris at the head of the bend at Orleans. It enters the Atlantic Ocean by a wide estuary, pouring out of its broad channel into the sea no less than from 23,000 to 42,500 cubic feet of water every second. The regions along its middle course are the real heart of France. As it issues from the valleys of the plateau it waters the Sologne, the chief rice-producing region of France; the Berri, to the south of the Sologne, a chalky plain from 350 to 700 feet high, interspersed with numerous ponds and covered with rich pasture-grounds; and Beauce, situated between Paris, Orleans, and Tours, quite flat and covered with cornfields and meadows. The Gâtinais, to the east of Beauce, spreads between the two great forests of middle France—the Forêt d'Orléans (which covers 99,500 acres) and the Forêt de Fontainebleau (41,700). Farther down

its course the Loire enters the lowlands of Tonnerre and Anjou, which are literally covered with corn-fields, gardens, and vineyards, while the cities of Tours, Saumur, and Angers are centres of manufacturing industry. The beautiful meadows, corn-fields, and gardens continue as far as Nantes, where the Loire enters its estuary; and the port of Nantes, although rather shallow for modern sea-going ships, grows in importance as a centre for fisheries and various manufactures.

The peninsula of Brittany is formed by two ridges of granitic hills, from 1000 to 1200 feet high, separated by a region of crystalline slates. Its scenery and moist climate, as well as those of the Cotentin peninsula, again remind one of England, with the meadows and fields fringed by trees, and the ivy-covered houses. Cattle-breeding on a large scale, poultry-farming, fruit-gardening, agriculture, and fishing are the chief riches of Brittany. The plateaus of Normandy (Le Perche), which rise from 1000 to 1300 feet above the surrounding plains, are also covered with beautiful meadows, cornfields, and forests, and French agriculture reaches there its highest development. The Seine separates them from the cretaceous chalky plains of the Caux, which raise their cliffs over the Channel, and are deeply cleft by valleys of a remarkable fertility.

The Seine (485 miles), which rises in the hills of Marvan, and drains with its tributaries (chiefly on the right bank) an area of 30,030 sq. m., certainly is far behind the Loire both as to the volume of water flowing in its channel and as a means of communication. Nevertheless, the wide Tertiary basin which it and its tributaries water has from remote antiquity been the dominant portion of historical France. Numerous large cities, like Auxerre, Sens, Troyes, Châlons, Reims, Laon, Reims, which all took such an important part in the making up of France—and especially Paris, which acquired its importance owing to its most advantageous position at the intersection of all the chief routes crossing France—are situated either on the Seine, or on its right-bank tributaries which water the fertile plains of Champagne. Le Havre is the great port at the mouth of the river.

Artois and French Flanders are low tracts of land to some extent conquered from the sea. They have a flourishing agriculture, vast coal-fields, and a great industry in their chief cities (Amiens, Lille, Roubaix); their population is rapidly increasing. At the other extremity of France the lowlands of the south occupy the sea-coast and the broad valley of the Rhone, along which they extend between the Alps and the plateau, as far north as Lyons, to be continued farther north by the valley of the Saône.

The Rhone (507 miles) has its source in the glaciers of the St Gothard group, and of its 33,180 sq. m. drainage area, peopled by 4,500,000 inhabitants, nearly one-tenth belongs to Switzerland. Below the Lake of Geneva its course is still in the mountains, and it is not far from its junction with the Saône at Lyons that it enters the plain of Dauphiné, dotted with numerous industrial cities of which Lyons is the centre. After receiving the Saône the Rhone suddenly changes its westerly course and flows rapidly due south in a rich valley, the slopes of which are covered with vineyards. Below Avignon the valley suddenly assumes a decidedly southern character, not unlike the driest parts of Sicily and Greece. The Isère, which rises in the Graian Alps, the Durance, which flows from the Cottian Alps, and a number of smaller streams rushing from the Cévennes join the Rhone, which bifurcates at Arles, leaving the marshy delta of the Camargue between its two main branches, and the gravelly plain of the Crau to the left. The tides

being insignificant in the Gulf of the Lion, the mouth of the Rhone is rapidly obstructed by mud and sand, and a canal (St Louis) had to be dug to permit ships to enter the river at Port St Louis.

The littoral of Provence has no great fertility, and, except the stony or marshy plains in the neighbourhood of the Rhone, there is but a narrow strip of land left between the mountains and the sea-coast, which is utilised for vineyards and fruit-gardens; but the remarkably well-sheltered harbours of Marseilles (q.v.), Toulon, Hyères, and St Tropez give birth to a considerable maritime commerce; and Marseilles is now the chief port of France for intercourse with the South and East. The eastern part of the coast, acquired from Italy in 1860, is well known for its mild climate and rich vegetation, which render Nice, Villefranche, Cannes, and Mentone the chief resort of the invalids of Europe. As to the western part of the Mediterranean coast—Languedoc—with its cities Montpellier and its seaport Cette, Carcassonne, and Perpignan, its vineyards were formerly the richest wine-producing part of France; but since 1875 they have been devastated by phylloxera, and corn grows now in the plains formerly covered with vines. The coal-fields of the region aid the development of a variety of industries. Finally, the Roussillon, which comprises the eastern outspurs of the Pyrenees, partakes of the character of the Iberian peninsula, especially of Catalonia.

*Climate.*—France enjoys on the whole a very fine climate; not so continental as that of central Europe, and not so maritime as that of England. Omitting the high hilly tracts of the Alps and Pyrenees, the coldest region of France is evidently that of the high plateau with its cold winters, though it has hot summer days. The north-eastern part of the plateau (Champagne, Lorraine, the Vosges) also has a continental climate much like that of central Europe. Frosts last there for from seventy to eighty-five days every year, but the amount of snow is seldom considerable in the plains. The Paris basin has a climate transitional between the above and that of the sea-coasts. Frosts occur for an average of fifty-six days yearly, but the average temperature of the winter is not lower than 38° F.; the spring is beautiful, and excessive heat does not last long during the summer. The annual rainfall is but 20 inches, and, though it rains on an average of 154 days in a year, the rains usually are of short duration. The climate of Brittany is very much like that of the south-west of England; while that of the plains on the Bay of Biscay is warm and dry (from 23 to 31 inches of rain per annum in the drainage area of the Garonne), and Pau, on the slopes of the Pyrenees, has the deserved reputation of a sanitary station. The region about Lyons has an intermediate, rather wet climate, with cold winter and not very bright summer; while the climate of Languedoc and Provence assumes to some extent an African character—a temperate winter is succeeded by a burning hot summer, moderated from time to time by the *mistral*, which blows with a terrible force from the Cévennes, purifying the air and throwing back to the sea the moistness which otherwise might result in rain, so that Marseilles has but fifty-five rainy days during the year.

*Population, Occupations, National Character.*—For origins of the French nation and the elements that compose the French population—Celtic Gauls, Belge, Aquitanians or Iberians, Romans, Franks and other Germanic tribes, and Normans—see the section below on the history of France, and the separate articles, such as BELGE, CELTS, FRANKS, &c. For the dominant language of France, see the section on French Language and Literature. For the Provençal language of the south of France,

see that head. In the north-west the ancient Celtic Breton tongue still survives (see BRITANNY); and in the south-west the distinct and peculiar Basque language is spoken by the bulk of the people in more than one department (see BASQUES). Flemish is spoken in French Flanders; the Walloons (q.v.) speak their own Romance dialect in the north-east of France; and German is still spoken in some districts of those parts of Alsace and Lorraine left to France on the French borders of Alsace, now incorporated with Germany. As to the national character, it is the sum of so many individual, provincial, and political varieties that a general judgment cannot be pronounced too cautiously. So much, however, can be said, that, like its territory, the French people is a natural transition between the inhabitants of southern Europe and those of the north. It combines the impressionability, the vivacity, the rapidity of conception, and the artistic feeling of the men of the south with the persistence, laboriousness, and rationalism of the men of the north. The sociability of the French has become proverbial. Their instability and levity are often, especially in Britain, made accountable for the frequent changes of government in France; but these assumed characteristics are but a poor attempt at an explanation of facts that have a far deeper historical meaning, and, moreover, stand in sheer contradiction to the practical sense and the inborn talent for organisation which are amongst the most striking features of France's economical and social life. The deeply systematic mind of the French strongly seconds a natural power of organisation, which appears in the simplest labour combinations of the workmen, as well as in the greatest enterprises in the more abstract domains of literature and science.

According to the census of May 30, 1886, the population of France (without Algeria) reached 38,218,903 inhabitants, as against 27½ millions at the beginning of the century, 32½ millions in 1831, 37½ millions in 1861, 36,102,921 in 1872, and 37,672,048 in 1881. The decline in population in 1861-72 is largely accounted for by the loss of territory that followed the Franco-German war; the remainder was due partly to losses in the war, and partly to an absolute decrease in the population of more than half of the departments. In 1881-86, also, over one-third of the departments show a falling off. The annual increase throughout France is notably slower than in the other chief countries of Europe, and its low rate is due not to a higher mortality—the mortality in France being nearly equal to that of the United Kingdom (23 to 24 per 1000)—but to the relatively small number of married people, and to the small proportion of children in each family (26 births per 1000 inhabitants, as against 35 in Great Britain, and nearly 40 in Germany). This low birth-rate does not hold good for all France: the small yearly increase of the total population is chiefly due to the more numerous births in the north and centre, the highest average (3 per family) being found in Brittany.

Frenchmen emigrate but little. Still, the last census has shown no less than 261,591 Frenchmen in Algeria; besides, there are 167,375 in the Argentine Republic and Uruguay (1880-82); 106,971 in the United States (1880); 58,992 in Switzerland; 51,104 in Belgium; and more than 20,000 in Spain. On the whole, emigration from France has been on the increase during the last few years. On the other hand, no less than 1,126,531 foreigners (chiefly Belgians, Italians, Germans, Spaniards, and Swiss) were returned in the census of 1886 as living in France.

In 1850 three-fourths of the population lived in the country, and one-fourth only in the cities; but the migration of country people to the cities

has gone on in France, as elsewhere, on a great scale; and at present out of each hundred inhabitants thirty-six are living in the cities. Migration is especially active into Paris and its neighbourhood, and to the seaports. In 1886 no fewer than 6,000,000 people lived in the forty-seven chief cities having each more than 30,000 inhabitants; and the following eleven cities had populations of more than 100,000: Paris (2,344,550), Lyons (401,930), Marseilles (376,143), Bordeaux (240,582), Lille (188,272), Toulouse (147,617), Nantes (127,482), St Etienne (117,875), Le Havre (112,074), Rouen (107,163), Roubaix (100,299).

Nearly one-half of the population still live by agriculture, as seen from the returns of 1886: Agriculture, 17,698,402; industries, 9,289,206; commerce, 4,247,764; sailors, fishermen, railway servants, 1,020,721; public forces, 613,362; professions, 1,805,260; living on income, 2,295,966; without occupation, 728,273; occupation unknown, 231,303—total, 37,930,257. Of the total population no less than 19 million persons represented families living on somebody else's salary or income, and more than 2½ millions are domestic servants; of the professional class one-half were public officials; while the grand total of clerks and other salaried persons in trade and commerce (exclusive of domestic servants) amounted to less than 5 million men and women. In agriculture the occupations appeared as follows: Farming proprietors, 2,431,481; farmers and *métayers*, 1,311,089; nursery-gardeners, &c., 212,055; foresters, wood-cutters, &c., 91,539—thus giving a total of 4,046,164 heads of establishments. These employed 2,860,801 labourers and domestic servants, and their families amounted to 10,782,437 persons.

**Land-tenure.**—The current opinion is that landed property is extremely subdivided in France, but this is true to a certain extent only, and needs some explanation. The official statistics supply merely the number of land-assessments (*cotes foncières*)—i.e. of persons having to pay the land-tax—and this number is a little over 14 millions. But, as it often happens that the same person pays several assessments in the same commune or in different communes, the above figure is much above the real number of landholders. It results from such statistics as are available that on the average the number of owners stands in the ratio of 594 owners to 1000 assessments, so that the aggregate number of land-owners hardly exceeds 8 millions, as seen from the following table:

| Size of Properties (Assessments),                | Number of Assessments, | Estimated Number of Landholders, | Number of Acres | Percentage to Aggregate Area. |
|--------------------------------------------------|------------------------|----------------------------------|-----------------|-------------------------------|
| Very small properties (less than 5 acres) . . .  | 10,426,303             | 6,182,837                        | 12,851,075      | 10.5                          |
| Small properties (5-15 acres) . . .              | 2,174,188              | 1,280,337                        | 18,640,683      | 15.3                          |
| Medium properties (15-120 ac.) . . .             | 1,351,499              | 801,440                          | 47,490,103      | 38.9                          |
| Large properties (120-500 acres) . . .           | 105,070                | 62,806                           | 23,174,522      | 19.0                          |
| Very large properties (over 500 acres) . . . . . | 17,076                 | 10,453                           | 19,812,498      | 16.2                          |
| Total . . . . .                                  | 14,074,801             | 8,346,802                        | 121,968,949     | 100                           |

Besides, out of the more than 10 million assessments of the first category, no less than 6½ millions are upon built property; so that the aggregate number of real agricultural land-owners does not exceed 4½ millions; of these about 73,000 persons own one-third part of the territory, about 801,000 own two-fifths of it, while 1,289,000 own only one-seventh part; and nearly 2,340,000 landholders who own less than one-thirtieth part of the

territory are compelled to work on somebody else's land. France is thus the country of middle-sized agricultural landholdings, with a considerable number of agricultural labourers who own nothing but a house and a garden, or not even that, and a not inconsiderable number of larger landlords. It must, however, be remarked that, though the concentration of land in the hands of great landowners is going on in certain parts, especially of central France, the tendency in other parts is towards the increase of such holdings of about 20 acres as can be cultivated by one family.

As to the dwellings of the peasantry, it appears from the fiscal registration made for levying the window-tax that no less than 2 million houses (of 8,933,986 houses all over France) are provided with one window only, or even have no aperture save the door; 3,709,556 houses have but two windows, or less.

**Agriculture.**—The landholdings are subdivided into no less than 127 million separate small plots, and this subdivision is the source of many drawbacks. Moreover, French agriculture suffers from an exceedingly high taxation. Nevertheless, it can favourably compare with that of Great Britain. Of a territory covering 123 million acres no less than 37 million acres are under cereal crops, 5,730,000 acres under vineyards, a little over 12 millions under meadows and grazing-lands, 21 millions under forests, and less than 17 million acres are unproductive. The average yield of wheat is but from 18 to 20 bushels to the acre (as against 28 in Great Britain), but the area under wheat (17 million acres) is much larger than in England; and the cereals altogether cover no less than 29 per cent. of the territory. The different crops and their average produce (in millions of bushels) are as follows:

|                  | Acres      | Million bushels |
|------------------|------------|-----------------|
| Wheat.....       | 16,990,000 | 290-320         |
| Oats.....        | 9,113,000  | 239             |
| Rye.....         | 4,100,000  | 60              |
| Barley.....      | 2,400,000  | 18              |
| Blackwheat.....  | 1,500,000  | 21              |
| Maize.....       | 1,500,000  | 21              |
| Green crops..... | 7,000,000  | ..              |

Beet-root for sugar covers about half-a-million acres. The terrible ravages of the phylloxera have reduced the area under vineyards from 6,382,000 acres in 1875 to 2,868,000 acres in 1885; but there has been some improvement since, and in 1888 the vineyards covered over 4½ million acres, yielding 682,247,000 gallons of wine. The imports of wine amount to about one-third of the home crop. The yearly production of cider varies from 210 to 440 million gallons, and that of alcohol (41 million gallons in 1885) is on the increase.

One of the most promising features of French agriculture is the high development of nursery-gardening, which achieves most remarkable results in variety and richness of crops. It may suffice to say that, owing to their perfect methods of horticulture, the *marachiers* round Paris and other large cities succeed in obtaining vegetables and fruit to the value of from £60 to £180 per acre. The planting out of trees and the reclamation of unproductive soil go on in various parts of France on a large scale; and, though the division of land prevents the farmers from acquiring improved machinery, the peasants' associations, and the practice of renting machines for a few days in a year, supplement that want to some extent.

Cattle-rearing has a tendency to become more and more specialised. Fine breeds of horses are reared in the north and north-west; the south is renowned for its donkeys and mules; cattle-breeding prospers in the wet district along the Channel, in the Pyrenees, the Limousin, the Jura, and the Vosges, and sheep-rearing all over the higher part of the plateau. Swine-breeding is on

the increase, and poultry-farming is an important source of well-being in the north and north-west. The exports of cattle, butter, eggs, cheese, and poultry, especially to England, are very considerable—no less than 70 million pounds of butter and 1000 million eggs being sent every year across the Channel.

**Fisheries.**—The fisheries are of great importance for France, both the deep-sea fishery (especially about Newfoundland), valued at nearly 3½ millions sterling every year, and also the coast fisheries, which employ some 53,000 fishermen, and yield a value of nearly 4 millions sterling every year. See FISHERIES.

**Mining and Metallurgy.**—France is relatively poor in minerals and metals. It has no gold, no silver, no platinum or mercury, and its produce of copper, zinc, lead, and tin hardly supplies one-twentieth part of its annual consumption. The iron-mines are more productive, but they are mostly far away from the coal-mines, and the cost of production is consequently increased. In fact, from one-third to one-half of the iron ore used in France is imported from foreign countries. The 112 foundries and 168 blast-furnaces of France produce every year a little more than 1½ million tons of pig-iron, while 200 ironworks, with about 1000 furnaces, make an average of 820,000 tons of iron and half-a-million tons of steel; but this supply falls far short of the demand. The coal-mines, which are scattered over the north, the region of the Upper Loire, and in Languedoc, are far from satisfying the needs of France, which imports about 28 million tons of coal, as against an average of 21 million tons raised at home.

On the other hand, France is very rich in all kinds of building stone, gravel, chalk, plaster, &c., and this circumstance has permitted her to build most of her cities of excellent stone, and to lay over the country a network of fine roads. The shales and phosphates, produced on a large scale, supply agriculture with chemical manure. No less than 100,000 men are engaged in quarrying the various kinds of stone. Rock-salt is raised to the amount of more than 100,000 tons, and 640,000 tons more of salt are secured from the sea.

**Manufactures.**—Manufactures have made rapid progress during the 19th century. While 65 steam-engines only were at work in 1820, their number has risen to nearly 55,000, representing more than 3½ million horse-power, and thus adding to the producing powers of the country a force equivalent to that of nearly 60 millions of human beings. All kinds of industries are represented amongst the nearly 150,000 manufactures of France. The textile industry gives occupation to at least 2,000,000 persons. In silks France has no longer the monopoly she formerly had, those being now woven all over Europe; but she still occupies the first rank, especially with regard to the finer stuffs and the production of new ones. The cotton factories are on a much smaller scale than those of Great Britain or the United States; but in the number of spindles (4,900,000) they nearly equal those of Germany. The aggregate annual produce of the textile industries (9,287,000 spindles, 166,300 power-looms, and 145,000 hand-looms) is valued at about £180,000,000. Then there are also sugar-works (423,000 tons), sugar-refineries (355,100 tons), chemical industries, potteries, paper-mills, and industries connected with furniture, dress, carriages, and all possible articles of luxury. Hundreds of small industries, which occupy two-thirds of the French industrial workers, are especially worthy of note, because it is in them that the artistic taste and inventive genius of the nation are especially apparent. Paris is the world's emporium for such small industries.

**Communications.**—The highways in France as a rule are kept in an excellent state, and no less than 120,000 miles of *routes nationales*, and twice as many miles of district roads, are the feeding-arteries of the network of railway lines, which covered an aggregate length of 19,900 miles in 1888. The total receipts were about £40,000,000. The traffic on the French railways is not half so brisk as on those of Great Britain, and the yearly number of passengers is only about one-third as large. The navigable rivers and canals, to which a great deal of attention is given in France, have a total length of 6510 miles, and the aggregate weight of merchandise transported on these waterways is twenty times the weight of transports by rail.

**Commercial Navy.**—The French mercantile marine—984 steamers (506,650 tons) and 14,253 sailing-vessels (465,880 tons) in 1888—is behind not only those of Britain, the United States, and Norway, but even of Germany and Italy. In the tonnage of her steamers, however, France is ahead of Germany by nearly 250,000 tons. Nevertheless, three-fourths of the French coasting and foreign trade is carried on under the flags of the republic. No less than 100,000 vessels (20 million tons) enter the French ports, and of these more than one-fifth (22,000 ships) are engaged in foreign trade.

**Foreign Trade.**—France is an illustration of the fact that a country having a well-developed agriculture may be very wealthy without having a considerable foreign trade. While the aggregate value of exports of home produce and imports for home consumption varies from £17 to £20 per head of population in the United Kingdom, it hardly reaches £8 in France. During the five years 1883-87 the annual foreign trade was valued at 5223 million francs for the imports, and 4244 million francs for the exports; of which the imports for home consumption were 4294 million francs, and the exports of home produce 3253 million francs (172 and 130 millions sterling respectively). The chief import is raw produce (1,906,752,000 francs in 1888), and the chief item of export is manufactured goods (1,658,317,000 francs). Raw silk, cotton, and wool are imported both for home use and for re-exportation in the shape of stuffs. Hides are imported to be manufactured into fine leather, gloves, or shoes; timber leaves France in the shape of artistic furniture, &c. France imports, as already said, a good deal of coal and iron ore, as well as of colonial wares, cattle, cereals, and other alimentary substances, representing an aggregate of 1,485,186,000 francs; she exports, too, 669,270,000 francs' worth of these, and 690,478,000 francs' worth of raw produce.

None of the French colonies is a source of enrichment for the mother-country. The total of French exports to the colonies amounts to about 9 millions sterling, Algeria alone representing 6½ millions; while the imports from the colonies (exclusive of Tunis) are valued at 11 millions sterling, Algeria representing about 5 millions, and the produce of the Newfoundland fisheries (imported from St Pierre and Miquelon) one million sterling.

**Government and Administration.**—Since the overthrow of Napoleon III., on September 4, 1870, France has been under a republican form of government, sanctioned in February 1875 by a constitutional law which has undergone since but slight modifications. The present French constitution remains a mixture of monarchical and republican institutions, and it has fully maintained its strong and old-established centralisation.

The unit of French administration is the commune, the size of which varies greatly, and which administers its own local affairs by means of an elected municipal council and an elected mayor. (Paris and Lyons have mayors for each of the divi-

sions of the city, the place of mayor of the city being taken by a nominated *prefet de police* and a *prefet*, whose jurisdictions overlap and occasionally come in conflict.) The independence of the communes is very much checked by the central government, but the present tendency of the more advanced municipalities is to take into their own hands the administration of a wide range of affairs formerly considered attributes of the state, while some of them incline more and more towards taking over the solution of important social questions. Every ten to fifteen communes constitute a *canton*, and next comes the *arrondissement*, or district, composed of not more than nine *cantons*; this has its own elected council, entrusted with the assessment of the local taxes, and subject to the sub-prefect. Four *arrondissements* on an average compose a department. This division was introduced during the great Revolution, when it was found desirable to abolish the old provincial institutions and to submit the whole of France to a centralised government. Nearly all departments are administrative areas which have received their names from their chief rivers or mountains, but otherwise have no geographical or economical meaning. France had 89 departments before 1870, but now it has only 86, or 87 if the 'territory of Belfort' be considered as a separate department (Haut Rhin). Each of them has a 'general council,' elected by universal suffrage—each *canton* electing one councillor. The general councils have wide powers as regards taxation and the promotion of institutions of public utility; but their decisions are jealously controlled by the prefect, who is the representative of the state in the department.

The legislative functions of the central government are vested in the Chamber of Deputies and the Senate; and the executive power in the ministry and the President of the Republic. The chamber is composed of 584 deputies (8 for Algeria, and 10 for the colonies), elected for five years by universal suffrage, in the proportion of at least one deputy for each district, or as many more as the population of the district contains hundreds of thousands of inhabitants. The composition of the senate is more complicated. Under the Constitution of 1875, of the 300 senators 75 had to be nominated for life by the government; but, by an amendment of the law, these are replaced by election as they die out. Of the remaining 225 seats a third are filled every third year by means of double elections. Every new law must be voted by both the chamber and the senate, and a congress of both bodies sitting together must be convoked for discussing alterations of the constitutional law.

The ministry is selected from the chamber by the President of the Republic, whose powers are, on the whole, very wide. He promulgates the laws voted by the two legislative bodies, he concludes treaties with foreign powers, appoints all functionaries, and has the right of dissolving the chamber with the approval of the senate. There is, moreover, a special body, the Council of State (*Conseil d'Etat*), which dates from the first and second empire, and now has the duty of giving its opinion to the government upon pending legislative schemes.

A formidable army of functionaries stands under the central government, in subjection to the prefects, who themselves are wholly under the authority of the Ministry of the Interior, and exercise a powerful influence on the results of the elections through their subordinates, as well as by means of various kinds of favours which they are in a position to accord to tradesmen, industrial establishments, and all kinds of private persons.

The names adopted by the sections of the Legislative Assembly in 1791, from the part of the house

in which they sat, have, with modifications, been retained in France, and extended to parliamentary parties in Germany and other countries. Those sitting on the 'Extreme Right' and the 'Right' of the president's chair were representatives of the burgher interest, Constitutionalists like the Fenilans (q.v.), and supported the king as far as they could. The 'Left' was composed of the Girondists (q.v.), moderate republicans who favoured the constitution as it stood. The 'Extreme Left' sat on the higher benches, and was nicknamed the 'Mountain'; it comprised representatives of the advanced clubs, Robespierre of the Jacobins (q.v.), and Danton of the Cordeliers (q.v.). The 'Centre' had no definite principles, usually voting with the Left.

The judicial organisation maintains many traces of its ancient character, and remains a powerful instrument in the hands of the government in political matters. In each canton there is appointed a justice of peace, who can decide only small civil cases where a value of not more than £8 is involved. Affairs of more importance must be brought before tribunals sitting in each district—all cases involving more than £40 being open to appeal before the appeal courts. In larger cities there are commercial courts and tribunals of *prud'hommes* elected by the heads of industrial establishments and the workers.

In criminal matters the secrecy of preliminary investigation (*instruction*) is a distinctive feature of the French judicial organisation; and this investigation, conducted by a state functionary, may last for months. No counsel for the defence is admitted till the affair has come before a court. Minor offences are tried by police courts, and a wide range of crimes, involving imprisonment for many years and the loss of civil rights, are tried by the courts of *Police Correctionnelle* without jury. The assize courts are assisted by a jury; but the jurors (from 400 to 3000 for each department) are chosen from among the citizens over thirty years old by a special committee composed in each canton of the mayor, the justice of peace, and his deputies; and that commission has the power to exclude any citizen from the list of jurors. These lists are submitted to a further scrutiny by a second district committee, which has the further right of nominating additional jurors to the extent of one-tenth of the total number required. From the decisions of all kinds of tribunals appeal may be made to the Court of Cassation (q.v.). The government is represented at each court by a public prosecutor. Separate military and naval courts pronouncing severe judgments in the smallest disciplinary matters complete an organisation which has been less modified than any other by the progress of liberal ideas. For French Law, see CODE.

The French prisons, one in each department, and nine central prisons for convicts undergoing more than one year's imprisonment, are mostly organised on the system of renting the prisoners' work to private employers. Those condemned to hard labour (an average of about 900 every year) are sent to New Caledonia or to Guiana.

*Religion.*—There is complete religious toleration in France, but three faiths are recognised by the state—i.e. their ministers are paid by the state, and enjoy several privileges. These are the Catholic, which is professed by 98 per cent. of the population; the Protestant, which has nearly 600,000 members, chiefly Calvinist; and the Jewish (63,000 in France, 43,000 in Algeria). The Mohammedan religion stands in the same position in Algeria. The statistics for 1884 show an aggregate of 54,513 priests, including chaplains, and 10,500 pupils of diocesan seminaries.

*Public Instruction.*—The present system is the outcome of a long, not yet fully terminated struggle between the state and the church, for the

right of using education as a means for promoting each its own ends. The National Convention drew up in 1794 and 1795 a wide scheme of public education under the control of the state, and to the exclusion of the clergy. But the scheme was never carried out, and under Napoleon I. education was organised so as to be subject to the combined influence of the state and the church. The right of establishing private schools was as good as prohibited. In 1833 (under Louis-Philippe and Guizot) the church obtained several privileges in its favour; and those privileges were confirmed and extended to middle and higher education by the two republican governments of 1850 and 1875. The church not only thus had its own primary schools, but it obtained the same privileges as regards secondary education, as well as the right of conferring university degrees. The laws of 1880 were a return to the schemes of the Convention. By these laws compulsory and free primary education has been introduced under the control of the state; the privileges of the church have been abolished; and, instead of religious teaching, the teaching of 'civic morality' from handbooks issued by the state has been introduced. But this subject has again come up for consideration. Private schools of all degrees are permitted, provided the teachers pass the obligatory examinations.

France is divided into seventeen educational districts called *académies*, the rectors of which are entrusted with the administration of higher and secondary education, as also with the inspection of the primary schools. Each educational district has an academic council, and each department has a council composed partly of state officials and partly of general councillors and delegates from the schoolmasters. In 1886 there were 66,500 primary schools, having 96,000 schoolmasters, of whom 16,400 were members of religious orders. Teachers are trained in eighty-nine training schools for male, and seventy-seven for female teachers. Nearly one-tenth of all recruits are still illiterate.

Secondary education, which may be classical, scientific, or technical, is provided for in 98 *lycées* and 256 *collèges* for boys (100,000 pupils), and 35 *lycées* and *collèges* for girls (only 9600 pupils); the latter are of quite recent introduction, the girls formerly being chiefly trained in convents, or receiving no education at all. Some 48,000 boys still receive secondary education in schools kept by the Catholic clergy.

Higher education, given in the *facultés* (universities), is of a high standard, and almost quite free. The chief centres are at Paris, Lyons, Bordeaux, Toulouse, Montpellier, Nancy, Lille, Nantes, and Grenoble; but most of these have only three, two, or even one of the four separate *facultés* (law, medicine, natural science, literature). Indeed, there is but one university at France, officially so called, which comprises the *facultés* at all the various centres (see UNIVERSITY). Altogether, these have 1600 professors and about 18,000 students. The clergy have their own 'free universities.'

Various special institutions, such as the Collège de France, the Museum of Natural History, the Polytechnic School, and many others, have a high reputation of long standing. For the Institute of France, with its five academies, see ACADEMY.

*Army and Navy.*—During the German war of 1870-71 France was able to meet the invaders with less than 400,000 men and 1250 guns; and it was not till after the fall of Napoleon that 700,000 men, mostly untrained and very badly provisioned, could be brought into the field. The whole system was totally reorganised in 1872. According to the now law, which received further development from subsequent legislation (especially in 1888), every Frenchman twenty years old, if not infirm, or

exempted from service for educational reasons, must enter the army and serve three years in the active army, six in the reserve, six in the territorial army, and ten in the territorial reserve. Rifles, guns, and all the necessities of warfare are kept in readiness for nearly 4 million men. Nearly 300,000 young men are called out every year, and more than 200,000 enter the ranks. The army numbers 541,000 men, and has 136,000 horses in time of peace. But in case of war it can be raised to 2½ million men; and 1½ million men more, all having received military training, may be added to the above. The military education of the soldiers is now much better than it was before 1870. See also ARMY.

The French navy is second only to that of Great Britain. It consists of 21 ironclad men-of-war, 7 ironclad cruisers, 6 ironclad guard-ships, 8 gun-boats, also ironclad, and 4 torpedo-cruisers. It has, moreover, 34 cruisers, and a number of fine despatch-boats and torpedo-boats, making a total of 351 steamers and 41 sailing-vessels. Of these there are 190 commissioned ships (704 guns), 53 ships in reserve (180 guns), and the rest (189 guns) were in 1889 not in commission.

**Finances.**—Like all other European nations, France sees its budget increasing every year, and yet never covering the expenditure. The chief source of revenue is indirect taxation (excise, registry, customs, and stamps), which forms about 62 per cent. of the revenue; the direct taxation (land, trade licenses, personal property, and doors and windows) comes next and makes 15 per cent. of the revenue; the monopolies (such as tobacco) and the remunerative services (like the post-office) supply 20 per cent. of the yearly income, and all these sources together have yielded annually during the ten years 1880-89 a little over 3000 million francs (£120,000,000). But, as the expenditure exceeds the income, extraordinary sources of revenue—chiefly loans—are resorted to, and during these ten years the real budgets varied from 3548 to 4167 million francs under the head of revenue, and from 3542 to 4190 million francs under the head of expenditure. Various new indirect taxes have had to be introduced to meet the expenses, among which the army counted for over 556 million francs in 1889, the navy for nearly 193 millions, the administration for 327 millions, the public instruction for 136 millions, and the public debt for no less than 1291 million francs—i.e. more than one-third of the yearly revenue.

The public debt, which reached 5516 million francs on the eve of Napoleon III.'s *coup d'état* (1851), was more than doubled during his reign. It rose to 12,454 million francs in 1870, and more than 11,000 million francs have been added to it since, chiefly on account of the war indemnity and war expenses, which together amounted to nearly 10,000 million francs. The French debt is now heavier than that of Great Britain, and the more so as France pays much higher interest on it. Collectively the national debt has been calculated at from 32,000 to 36,000 million francs (£1,280,000,000 to £1,440,000,000)—which is about the estimated aggregate yearly income of the whole of the nation.

The aggregate debts of the separate municipalities reach about 3000 million francs. Paris is one of the most heavily indebted cities of Europe, and pays every year no less than 107 million francs of interest upon its municipal debt.

For the money, weights, and measures used in France, see FRANC, MÈTRE, LITRE, GRAMME, DECIMAL SYSTEM. **HISTORY.**—Through association of mind with the people and country of France in their contemporary form, the student of French history starts with an aggregate of geographical, ethnological, and sociological notions whose validity diminishes in proportion as he plunges deeper into the past.

In prehistoric times, among the inhabitants of western Europe, from the Rhine to the Atlantic seaboard, no essential lines of difference can be drawn; the Alps, the Pyrenees, the British Channel formed land-marks of a superficial character. But the Rhine was then, as it is now, a sharp ethnological boundary. The trading-voyages of the Phœnicians and the conquests of the Carthaginians left no impression upon the west of Europe. Though Greek civilisation gained a footing at Massilia, now Marseilles, history, for France, as for Great Britain, and Spain, began with the Roman Conquest. Julius Cæsar is the first historian of France, which, under the name of Gaul, was invaded by him (59-51 B.C.), civilised by force, and incorporated into the Roman empire. Thanks to the common ethnological points of Celt and Roman, the native elements rapidly adopted the imported language, culture, and laws of Rome. Protected against Teutonic invasion by military posts on the Rhine, subjected for the first time to legislation and administration, the Gallic tribes, who had risen before their conquest to the height of civilisation attainable by them without foreign aid, turned to peaceful pursuits, such as agriculture and commerce, and built for their governors amphitheatres, public baths, aqueducts, military roads. Lugdunum (Lyons) became a Transalpine Rome. In the 2d century A.D. Gaul was the most populous, in the 4th it was one of the most civilised Roman provinces. Its schools were so famous that Roman-born students went to learn there the art of eloquence. Its nobles and cultured classes supplied the empire with more than one general and with more than one poet or prose-writer. It became the home of an enlightened Christianity, but did not escape the rebellions of slaves and land-labourers which broke out now and then in the empire, and bore witness to aristocratic and ecclesiastic oppression. Thus, by the engrafting of Roman civilisation upon the old Celtic stock, there grew between the Alps, the Mediterranean, the Pyrenees, the Atlantic, and the Rhine a Gallo-Roman state, with a culture free from the Hellenistic stamp peculiar to the eastern provinces of the empire, and more akin in many respects to our modern circumstances than to those of the ancient world. Indeed, Gaul was fast being elaborated into a pure neo-Latin nationality, when, from the year 395 onward, the Teutonic tribes, pent up to the east of the Rhine, and pressed from behind by Slavonic hordes, burst upon the scene and acted as a dissolvent upon Roman civilisation. Beaten in Tuseany in 406, bands of Vandals, Burgundians, Suevi, and Alemanni, falling back upon Gaul left bare of troops, destroyed the forts on the Rhine and in the interior of the country. After long wanderings the Burgundians settled in the fruitful plains of the Rhone valley, and founded the kingdom of Burgundy from the Mediterranean border to the Vosges. A few years later the Goths, also retreating from Italy, occupied both sides of the Pyrenees, founding the kingdom of the Visigoths, from the Garonne in the north to the Ebro in the south, with its capital at Toulouse. In 451 a Roman general of barbarian birth, Aetius (q.v.), fighting at the head of an army in which Romans, Burgundians, and Visigoths stood

side by side, defeated in the Catalaunian fields (Châlons-sur-Marne) the hordes of Attila. This was Rome's last deed of war in Gaul.

The staff of military supremacy fell from the hands of the Romans into those of the Franks. Those were a confederacy of the Germanic tribes between the Rhine and the Harz Mountains, whom the Romans had attacked in vain, and to whose persistent invasions they had to sacrifice Belgium. Once in possession of the banks of the Meuse and of the Sambre, they advanced under their king Clovis (481-511) towards the Seine and the Loire, and made at first Soissons and then Paris their capital. Clovis became a Christian. Carving out for himself a realm abutting to the south upon the Visigoths, and to the east and south-east upon the Burgundians, he laid, from the Rhone and Garonne to Brittany, foundations for the future kingdom of France. Clovis, through his zeal in the interests of the Catholic Church, earned the title of 'most Christian king,' which passed from the Frankish chiefs to the kings of France. The emperor at Constantinople gave him the Roman title of patrician and consul. The Franks remained subject to their own 'Salic law,' but they maintained in Gaul Roman law, Roman state and church organisation. Thus a Germanic tribe became the leading military and political agent in the plains of northern Gaul, and gave to France its name and its first dynasty of kings, the Merwings or Merovingians (q.v.); but it adopted the Roman tongue of the conquered, and so did the Visigoths and Burgundians in their own dominions.

In 752 the Karlings or Carolingians (q.v.), in the person of Pepin the Short, superseded the Merovingian dynasty, and laid the foundation of the temporal power of the popes. Pepin's son, Charlemagne (768-814), raised to its zenith the supremacy of the Franks in western Europe, by uniting under his hegemony the Germanic states hewn out of the Roman provinces. Coming at a time when the Germanic ruling classes were no longer separable from the conquered masses, the formal centralisation of power in his hands, ratified by his coronation in 799 as Roman emperor by the pope Leo III., could not long stem the forces at work for the splitting up of western Europe into a number of small states; neither could this result be accomplished by the building up of a military monarchy extending from the Ebro in Spain, and from the Apennines in Italy, to the North Sea, and from the Atlantic to the Elbe in Germany, the establishment of a code of imperial law and of a system of imperial government, the encouragement of learning and commerce. The Frankish military hegemony fell to the ground under the reign of his weak successors. The next step towards the formation of France was the Treaty of Verdun (843), by which the localisation of the Germans became final; their former racial unity sank in an awakening sense of different nationalities.

**Fendal Monarchy.**—Though Charles the Simple was politic enough to put an end to the incursions of the Normans by making their leader Rollo Duke of Normandy, the unchecked development of a hereditary aristocracy had reduced the royal power to a shadow, when in 987 Hugh Capet, Count of Paris and of Orleans, was made king by the feudal chiefs. He was the real founder of the French monarchy as distinct from the extinguished Frankish kingship, and from the imperial dignity which was vested after Charlemagne in the ruling house of Germany. While the Roman emperors of the German nation often took up their abode at Aix-la-Chapelle, Charlemagne's residence, the Capetian kings, residing in Paris and crowned in Rheims, became an outward sign that the Rhine divided races again, as in the days of Varus and Arminius

(q.v.). Louis *le Gros* (1108-37) regulated the fendal system, abolished serfdom on his own estates, secured corporate rights to the cities under his jurisdiction, while a new element in the state was generated by the foundation of a free burgher class. At this juncture the policy of the Plantagenets forced England into hostility with France. Henry of Anjou, already Duke of Normandy, suzerain lord of Brittany, Count of Maine and Touraine, had married Eleanor of Aquitaine, who brought him the provinces of Guienne, Poitou, and Gascony; and when in 1124 he became king of England as Henry II. (q.v.), his prestige outshone utterly the French court. The kings of England laid claim to the crown of France; the French kings demanded obedience from their too powerful vassals. Hence an enmity so persistent, and fed subsequently from so many sources, that the Crusades, of which the Normans were the most zealous promoters, and in our days the Crimean war, offer the only instances of military fellowship between England and France. Philippe Auguste (1180-1223) recovered Normandy, Maine, Touraine, and Poitou from John of England. He took an active personal share in the Crusades, and permitted the pope to organise a cruel persecution against the Albigenses in the southern parts of the country. Philippe was the first to levy a tax for the maintenance of a standing army, and in his reign a chamber of peers, of six secular and six ecclesiastical members, was instituted to act as a council of state. Many noble institutions date their origin from this reign, as the university of Paris, the Louvre, &c. A right of appeal to the royal courts was established, and the arbitrary power of the great vassals crippled. Improvements in the mode of administering the law were continued under his son, and his grandson, Louis IX. (1226-70), who, before his departure for the Crusades, secured the rights of the Gallican Church by a special statute, in order to counteract the constant encroachments of the papal power. Under his son, Philippe III. (1270-85), titles of nobility were first conferred by letters-patent. He added Valois and the *comtés* of Toulouse and Vennaisin to the crown. Philippe IV. (1285-1314), surnamed *le Bel*, acquired Navarre, Champagne, and Brabant by marriage. With the object of securing support against the secular and ecclesiastical nobility, Philippe gave prominence to the burgher element in the nation, and for the first time called together the *Etats Généraux*, or States General, at which the *tiers état*, or burgher class, appeared together with the nobles and clergy. With the view of securing to the crown the great fiefs, he abrogated the right of females to succeed to landed property. His tyrannical persecution of the Templars showed his abuse of the regal power, while the transference of the holy see to Avignon brought the popes for seventy years under the influence of the French court. Under his three sons and successors, Louis X. (1314-16), Philippe V. (1316-22), and Charles IV., *le Bel* (1322-28), the rule of the kings of France was strengthened and extended.

**House of Valois.**—Philippe VI. (1328-50), the first of the House of Valois, succeeded in right of the Salic law. His reign, and those of his successors, John (1350-64) and Charles V., *le Sage* (1364-80), were disturbed by constant wars with Edward III. of England, who laid claim to the throne in right of his mother, a daughter of Philippe *le Bel*. The war began in 1339; in 1346 the battle of Crécy was fought; at the battle of Poitiers (1356) John was made captive; and before its final close, after the death of Edward (1377), the state was reduced to bankruptcy, the nobility excited to rebellion, and the mass of the people sunk in barbarism. Debasement of the coinage,

onerous taxation, and arbitrary conscriptions brought the country to the verge of irretrievable ruin, while the victories of England humbled the sovereign, annihilated the French armies, and cut down the flower of the nation. The long and weak minority of Richard II. diverted the English from the prosecution of their groundless claims to the kingdom of France; but during the minority of Charles VI., *le Bien Aimé* (1380-1422), the war was renewed with increased vigour on the part of the English nation, who were stimulated by the daring valour of Henry V. The signal victory won by the English at Agincourt in 1415; the treason and rebellion of the French princes of the blood, who governed the larger provinces; the ambition of the several regents, the ultimate imbecility of the king, the profligacy of his queen, and the love of pleasure early evinced by the dauphin; all combined to aid Henry in his attempts upon the throne. But the premature death of Henry, the persevering spirit of the people, and the extraordinary influence exercised over her countrymen by the Maid of Orleans concurred in bringing about a thorough reaction, and, after a period of murder, rapine, and anarchy, Charles VII., *le Victorieux* (1422-61), was crowned at Rheims. He obtained from the States General a regular tax (*taille*) for the maintenance of paid soldiers, to keep in check the mercenaries and marauders who pillaged the country. The policy of his successor, Louis XI. (1461-83), favoured the burgher and trading classes at the expense of the nobles, while he humbled the power of the vassal princes. He was a crafty ruler, who managed the finances well, and succeeded in recovering for the crown the territories of Maine, Anjou, and Provence; while he made himself master of some portions of the territories of Charles the Bold, Duke of Burgundy. Charles VIII. (1483-98), by his marriage with Anne of Brittany, secured that powerful state, and consolidated the increasing power of the crown. With him ended the direct male succession of the House of Valois.

Louis XII., *le Père du Peuple* (1498-1515), was the only representative of the *Valois-Orléans* family. The tendency of his reign was to confirm the regal supremacy, while the general condition of the people was ameliorated. He and his successor, Francis I. (1515-47) of the *Valois-Angoulême* branch, wasted their resources in futile attempts to establish their hereditary claims to Lombardy. Francis I.'s rivalry with the Emperor Charles V. of Spain, representative of the House of Hapsburg-Burgundy, gave itself vent in four wars for the possession of Burgundy and Italy. Taken prisoner at the battle of Pavia (1525) and led away to Madrid, Francis ultimately made good his title to Burgundy (1544), but had to renounce Italy. His reign is marked by the flowering of the Renaissance, by the beginning of the Protestant Reformation, by the further strengthening of the absolute power of the monarchy, by the subordination of the clergy to the crown in terms of the 'Concordat' signed with the pope. An ally of the Protestant princes in Germany, and of the schismatic king of England, Henry VIII., he yet remained in his home policy an adherent of the Roman Catholic religion. He and his immediate successors were concerned mainly with the political aspects of the Reformation, which recruited its upholders from the aristocratic and enlightened classes. Henri II. (1547-59) recovered Calais for France. Under Francis II. (1559-60) the Roman Catholic House of Guise obtained possession of the effective power in the state. Their adversaries, the House of Bourbon, headed the movement of the 'Réforme.' Under the weak kings Charles IX. (1560-74) and Henri III. (1574-89), who were under

the influence of their mother, Catharine de' Medici, this division in the French nobility resulted in the war of the League and wars of religion. The massacre of the Protestants on the night of St Bartholomew (1572) raised to such a pitch the pride of the House of Guise that Henri III. fled to the camp of the Bourbon leader, where he was murdered by a fanatic monk. The name of Charles IX. remains associated with the horrors of the St Bartholomew's night, which witnessed the striking of a blow at the very heart of the nation; the first step in a periodical recourse to murder, persecution, and proscription. Such horrors, renewed by Louis XIV. against the Protestants, and applied by the Revolution to a different class, have, with the triumphant campaigns of Napoleon, done more to weaken France than the worst blows of its enemies.

*Bourbon Line.*—The accession of the Bourbon prince, Henri IV. of Navarre (1589-1610), allayed the fury of religious wars, but his recantation of Protestantism in favour of Catholicism disappointed his own party, to which, however, he granted the free exercise of their religion and ecclesiastical autonomy by the Edict of Nantes (1598). By degrees Henri, through the counsel of his minister Sully, and by his own personal popularity, raised the power of the crown higher than ever, while he began a system of thorough administrative reform, which was arrested only by his assassination by the fanatic Ravalliac. During the reign of his son, Louis XIII. (1610-43), Cardinal Richelieu, one of the greatest statesmen of modern Europe, resumed the policy of Francis I. against the House of Hapsburg by entering into a compact with the Protestant princes engaged in the Thirty Years' War, raised higher the authority of the crown at home, and humbled the Huguenots, who in the south and west of France had established almost a state within the state. Cardinal Mazarin, under the regency of the queen-mother, Anne of Austria, governed during the minority of Louis XIV. His continuation of Richelieu's policy roused the parliament of Paris to a last effort in favour of its ancient political liberties, systematically cut down or ignored by the kings; the nobility also made a last stand for their feudal rights. The civil war of the Fronde ensued (1648-53). Its termination put all classes under the heel of the young king, Louis XIV. (1643-1715), who could justly say, with local parliaments reduced to judicial and administrative bodies, with aristocrats demeaned into courtiers, 'L'état, c'est moi.' During his reign the French monarchy culminated. But under a cloak of magnificence, sores gathered sufficient to effect its ruin less than seventy-five years after his death. He continued the policy of Richelieu and Mazarin. The successes of his armies under Condé, Turenne, Vauban, Luxembourg, Catinat, Vendôme, Boufflers, and Créquien extended the boundaries of France to the Rhine, and to Flanders in the north; this was mainly due to the talent of Louvois in developing the military and naval resources of France, and to the financial skill of Colbert. But the war of the Spanish Succession (1701-14), though confirming a prince of the House of Bourbon upon the Spanish throne, ended disastrously for the French, repeatedly defeated by Prince Eugene of Savoy and Marlborough. At home the greatest splendour and luxury were displayed; art, literature, and science flourished to a degree unknown before. The proud king compelled the pope to restore to the Gallican Church some of its privileges, but he fell under the influence of Jesuit advisers, and dealt his country a baneful blow by the revocation of the Edict of Nantes (1685), causing 400,000 Protestants to emigrate. At the close of his rule, his absolutism and

higotry, the oppressive war-taxes, the prodigality of the court, and the luxurious lives of the clergy bore their fruit.

His youthful heir, Louis XV. (1715-74), succeeded to a heritage whose glory was tarnished, and whose stability was shaken to its very foundations. The long reign of Louis XV. presents nothing worthy of notice except the gradual rise of those modern philosophical and political sentiments which prepared the overthrow of all the ancient institutions of the country. The regency of the profligate Orleans paved the way for the miseries which followed, while his corrupt financial administration brought the nation into the most overwhelming financial embarrassments. In this reign Corsica was added to France. The thorough disorganisation of the state, and the neglect of the fleet and army, prevented all attempts at conquests either by sea or on land. The colonies were left a prey to the attacks of other powers, while the capricious change of policy which the king's mistress, Madame de Pompadour, forced upon the government brought contempt on the country. The Peace of Paris (1763), by which the greater portion of the colonial possessions of France were given up to England, terminated an inglorious war, in which the French had expended 1350 millions of francs. The close of this unhappy reign was still further disturbed by the exals of the Jesuits, but their banishment in 1764 marked the triumph of the philosophic movement over the Roman Catholic Church. In 1774 Louis XVI., a well-meaning, weak prince, succeeded to the throne. His first ministers, Maurepas, Turgot, and Malesherbes, had not the vigour to carry out reforms. They were succeeded by the financier Necker, who endeavoured, by economy and method, to arrest the impending bankruptcy of the state. The influence of Voltaire, Rousseau, Montesquieu, and a host of other writers imbued with the modern democratic spirit, the sufferings of the masses, the importation of English political ideas, the American war of independence, in which the French took an important part (in pursuance of a deliberate design in this way most effectually to weaken England), the restoration to the Paris and provincial parliaments of some of their long-lost privileges, conspired together to sound the death-knell of monarchical absolutism. After much opposition on the part of the king and court, the States General, which had not met since 1614, assembled at Versailles on the 25th of May 1789. They formed themselves into a *National Assembly*, thereby commencing the Revolution, and undertaking to make a new constitution, they presently called themselves the *Constituent Assembly*.

*The Revolution.*—Under the 'ancien régime' thus abruptly brought to an end the grades of nobility had become so numerous that their members stood in the ratio of 1 to 250 of the entire population. Nevertheless, every grade of nobility exempted its holder from the payment of the ordinary land-tax or *tulle*, from the charge of maintaining the public roads (*corvée*), from military conscription, from receiving billets of soldiers, &c. The nobles paid the *capitation* tax, but in a very unequal proportion, although the landed property was vested almost entirely in their hands. They, in fact, together with the clergy, monopolised the principal share of the national revenues, and left to the lower classes the burden of labour and of paying the taxes. At the outbreak of the Revolution the French nobility were sunk in profligacy and fallen to the lowest stage of demoralisation. The clergy kept pace with the nobles in general depravity, and while their aggregate revenues amounted, according to Necker, to 130,000,000 of livres, and their landed property stood in the

relation of 1 to 5½ of that of all other proprietors, their contributions towards the maintenance of the state were inadequate and irregular. The *tiers état* were crushed by the weight of an unjust taxation, which was rendered more onerous by the system of farming out some of the taxes. The most tyrannical of these was the tax (*gabelle*) on salt. The municipal institutions which had been permitted to flourish under some of the Valois princes in the middle ages were almost entirely abolished, and the offices of towns, like those of the state and the courts of justice, were either hereditary or open to purchase. The *tiers état*, which included professional men and all who were not members of either the noble or the clerical order, saw themselves utterly excluded from all participation in the privileges and duties of free citizens at the very time when their minds were drawn to the discussion of questions of political independence, equal rights, and universal freedom.

The resistance made by Louis and his advisers to the reasonable demands of the Deputies led to their declaration of inviolability. The king retaliated by ordering a large body of troops under arms, dissolving his ministry, and banishing Necker, whom he had shortly before recalled under the pressure of public opinion. The consequence was the outbreak of insurrectionary movements at Paris, where blood was shed on the 12th July 1789. On the following day the National Guard of Paris, and a new civic militia under the authority of the municipality, was convoked; and on the 14th the people stormed the Bastille. The provinces repeated the acts of Paris, and everywhere national guards and revolutionary municipal councils were called together. On the 4th of August feudal and manorial rights were abrogated by the Assembly, which made a solemn declaration of the equality of human rights. The royal princes and all the nobles who could escape sought safety in flight. The royal family, having attempted in vain to follow their example, tried to conciliate the people by the feigned assumption of republican sentiments; but on the 5th of October the rabble, followed by numbers of the National Guard, attacked Versailles, and compelled the king and his family to remove to Paris, whither the Assembly also moved. The next two years witnessed the solemn inauguration and the subsequent withdrawal of various constitutional schemes. The princes of the blood and the ancient noblesse raised corps of émigrés, but their efforts could not arrest the spread of republicanism. The king alternately made concessions to the republicans, and cherished schemes for escaping from their surveillance; but each month added to his humiliations and to the audacity of those surrounding him. With the death in 1791 of Mirabeau, the champion of the National Assembly, all chance of the establishment of constitutional monarchy perished. The Constituent Assembly was succeeded in 1791 by the *Legislative Assembly*. The king was compelled by the Girondists to a war with Austria in April 1792; and the early defeats of the French were visited on Louis, who was confined in August with his family in the Temple. The advance of the Prussians into Champagne threw Paris into the wildest excitement. The Assembly dissolved itself in September, the *National Convention* took its place, and the republic was proclaimed. In December the king was brought to trial, and called upon to answer for repeated acts of treason against the republic. On the 20th January 1793 sentence of death was passed upon him; and on the following day he was beheaded. Revolts burst out in every part of France. England, Holland, Spain, Naples, and the German states combined together against the republic. Christianity was now formally repudiated, and

the sacredness of the republic and the worship of Reason solemnised. Marie Antoinette, the widowed queen, was guillotined; the dauphin and his surviving relatives suffered every indignity. A reign of blood and terror succeeded. Danton and Robespierre, after having condemned countless numbers to the guillotine, suffered each in turn a similar fate. After the destruction of the Terrorists a reaction gradually set in; the people were wearied of bloodshed and anxious for peace and order at any price. In 1793, 1795, and later, insurrections took place in La Vendée on behalf of the white flag, but were quenched in blood. The brilliant exploits of the young general Napoleon Bonaparte in Italy turned men's thoughts into fresh channels. In 1795 a general amnesty was declared, peace was concluded with Prussia and Spain, and the war was carried on with redoubled vigour against Austria. The Revolution had reached a turning-point.

A *Directory* was formed to administer the government, which was now conducted in a spirit of order and conciliation. In 1797 Bonaparte and his brother-commanders were omnipotent in Italy; Austria was compelled to give up Belgium and recognise the Cisalpine Republic. The glory of the French arms was re-established abroad, but at home the nation was still suffering from the shock of the Revolution. The Directory repudiated two-thirds of the national debt, and thus almost ruined the commerce and credit of France. Under the pretext of attacking England, a fleet of 400 ships and an army of 36,000 picked men were equipped; their destination proved, however, to be Egypt, whither the Directory sent Bonaparte; but the young general, resigning the command to Kléber, landed in France in 1799. The Directory fell on the famous '18th Brumaire' (9th November 1799); under the constitution of Sieyès the state was put under three consuls who unlike those of Rome were three in number, with different degrees of authority; Napoleon secured supreme power as First Consul. In 1800 a new constitution was promulgated, vesting the sole executive power in Bonaparte, who showed consummate skill in reorganising the government, to which he imparted a systematic efficiency and a spirit of centralisation that secured a thoroughly practical administration. Having resumed his command, he marched an army over the Alps, attacked the Austrians unawares, and decided the fate of Italy by his victory at Marengo. In 1801 the Peace of Lunéville was concluded, and the boundaries of France were once more extended to the Rhine. England was the only country which refused to recognise the various Italian and German conquests of France; and, with the exception of a brief period of peace, England remained the implacable foe of Bonaparte from the days of the consulate to his defeat at Waterloo. Every period of respite from war was employed by the First Consul in fostering trade and industry, and in obliterating both in private and public life the stains left by the Reign of Terror.

*The Empire.*—In 1804, on an appeal by universal suffrage to the nation, Bonaparte was proclaimed emperor. The pope came to Paris to crown him and his wife Josephine; a new nobility was rapidly created, and the relatives and favourites of the emperor received vanquished kingdoms and principalities at his hands. For a time Napoleon's influence with the weakened powers of the Continent succeeded in maintaining an injurious system of blockade against England; and, except in the Peninsula, his arms were everywhere victorious. His marriage, too, with the Archduchess Maria Louisa, a direct descendant of the ancient House of Hapsburg (1810), seemed to give to his throne the prestige of birth, which alone it had lacked.

He kept up the democratic impulse of the Revolution as much as was wanted to drive his engine of war. His tactics would have availed him little against the successive European coalitions had he not adopted the principle of national armies, general conscription, and forced requisition introduced by Carnot, the 'organiser' of revolutionary France's victorious resistance against foreign aggression. This principle has since become the outstanding feature of continental warfare. It gave Napoleon an empire including practically the whole of Europe, except Russia, Turkey, and Great Britain; when it was quietly introduced by Prussia, it assisted effectually in bringing to a close the emperor's career, but not until he had made himself king of Italy (1805), made of Holland and Naples vassal kingdoms (1806), set up in Germany the Confederation of the Rhine, conquered Prussia (1806-7), occupied Portugal, deposed the Bourbons in Spain (1808), reduced the Hapsburgs after four campaigns from their medieval title of Roman emperors to the status of emperors of Austria, made of Rome a French town, and carried off Pope Pius VII. to Fontainebleau. In the long run, the evils attending his high-handed policy both in France and out of it undermined his position. The French navy was destroyed by Nelson at Trafalgar (1805), and the sea-trade of France much injured. His despotism, the unceasing strain of war, the burden of conscription, the estrangement between emperor and pope threw the seed of disaffection among the French people.

From 1811 to his final defeat in 1815 the emperor rapidly lost ground. The disastrous Russian campaign, in which his enormous army of 400,000 men was lost amid the rigours of a northern winter, was soon followed by the falling away of his allies and feudatories. Napoleon himself was still victorious wherever he appeared in person, but his generals were beaten in numerous engagements; and the great defeat of Leipzig (1813) compelled the French to retreat beyond the Rhine. The Swedes brought reinforcements to swell the ranks of his enemies on the east frontier, while the English pressed on from the south; the senate and his ministry betrayed his cause, and the allies marched on Paris, which, in the absence of the emperor, capitulated after a short resistance, March 30, 1814. Napoleon now abdicated in favour of his young son, and retired to the island of Elba, the sovereignty of which had been granted to him. His wife and son removed to Vienna; his family were declared to have forfeited the throne; France was reduced to her former limits, and the provinces she had acquired were restored to their national rulers.

*The Restoration.*—On the 3d May Louis XVIII. (the brother of Louis XVI.) made his entry into Paris. The conduct of the Bourbons did not conciliate the nation; they returned loaded with debts, and surrounded by the old nobility and clergy, who had not renounced their former privileges, and who looked upon the generation of Frenchmen that had arisen since the Revolution as their natural enemies. A narrow spirit influenced the weak policy of the king, which led to the establishment of a strict censorship, the extension of the powers of the police, and the persecution of the adherents of the Empire; while the lower classes and the army, who alike resented the humiliating reaction that had followed the former excitement of war and conquest, were treated with an indifference, and even contempt, by the returned emigrés, to which they were wholly unaccustomed. On the 1st March 1815 Napoleon left Elba and landed in France. The soldiers flocked around his standard; the Bourbons fled, and he took possession of their palaces. The news of his landing spread terror

through Europe; and on the 25th March a treaty of alliance was signed at Vienna between Austria, Russia, Prussia, and England, and preparations were at once made to put down the movement in his favour and restore the Bourbon dynasty. At first the old prestige of success seemed to attend Napoleon; but on the 18th June he was defeated at Waterloo; and, having placed himself under the safeguard of the English, he was sent to the island of St Helena, in conformity with the generally acknowledged sentiment that it was necessary to the peace of Europe to remove him finally and definitely from the scene of his former power.

The second restoration gave occasion to many pledges of a more liberal policy on the part of Louis, but few of them were fulfilled, and a general and sullen discontent reigned among the people, who were again deprived of all voice in the administration or in the election to offices, and were harassed by the petty tyranny of the priests, who were the favourite advisers of the crown. In 1821 Napoleon breathed his last at St Helena; and in 1824 Louis XVIII. died without direct heirs, when his brother, the Duc d'Angoulême, succeeded as Charles X. The same ministerial incapacity, want of good faith, general discontent, and excessive priestly influence characterised this reign, which was abruptly brought to a close by the revolution of 1830, and the election to the throne of Louis-Philippe, Duke of Orleans, as king by the will of the people. Progress in material prosperity made his government popular with the *bourgeoisie* or middle classes, and for a time he held his ground. The warlike propensities of the nation found an outlet in the war in Algeria with Abd-el-Kader.

*The Second Republic.*—But the determined resistance of the king to the growing desire for electoral reform led at last to open insurrection in Paris; and, Louis-Philippe having abdicated (February 24, 1848), a republic was proclaimed under a provisional government. An insurrection of the Red Republicans in Paris (June 1848) was only put down after great slaughter. Louis Napoleon was elected President of the Republic in December 1848; but by the famous *coup d'état* of December 2, 1851, he violently set aside the constitution and assumed dictatorial powers; and a year after (2d December 1852) he was raised by the almost unanimous voice of the nation to the dignity of emperor, as Napoleon III.

*The Second Empire.*—The constitution of this second empire was the same as that of the first. A senate and a legislative body, shorn of all effectual parliamentary rights, screened badly the emperor's complete absolutism, under which, however, France made great advances in the development of her natural resources and in manufactures. Assuming the character of an adjuster of the wrongs of nations, Napoleon proclaimed himself a mediator in the Danish and Austro-Prussian wars, and the defender of the Italians against Austria, of the pope against the people of Italy, and of the Mexicans against the government of the United States of America. By his help the Italians were relieved from the Austrian yoke, and the pope was left master of Rome; but in Mexico his intervention only led to greater bloodshed, and ended ignominiously for his arms, and fatally for the cause and life of his protégé, the Austrian Prince Maximilian. He acted better beside England in the Crimean war (1854-56), and entered upon a wise economic policy by signing with that country a treaty of commerce (1860) on free-trade lines. Although the brilliant success of the Paris Exhibition of 1867 seemed to afford evidence of the personal and national consideration in which the emperor was held, his political credit had already then lost its

importance. At home the great financial embarrassments of his government were arousing the discontent of the people; and to avert the growing disaffection Napoleon offered (1869) to adopt a constitutional form of government, and to make some concessions in regard to freedom of the press. It was soon found that the responsibility of the ministry was fictitious, and that the emperor availed himself of its protection to cloak his own acts of personal government. The result of the appeal made to the nation in 1870, on the plea of securing their sanction for his policy, was not what he had anticipated; and the 50,000 dissident votes given by the troops in this plebiscite revealed a hitherto unsuspected source of danger. Confident in the efficiency of the army, and anxious to rekindle its ardour, he availed himself of a pretext to declare war against Prussia.

The course of events in the short but terrible Franco-German conflict of 1870-71 astonished Europe by its unexpected character, revealing at once the solidity of Prussian strength and the hollowness of imperial power in France. War was declared on the 15th July, and it had been the intention of the French emperor to cross the Rhine at Maxau and push his armies between the North and South German States so as to force the latter into neutrality. Such action required superiority in numbers and mobility at the very outset, besides good generalship. These advantages were soon found to be all on the side of the Germans, whose perfect organisation enabled every detail of mobilisation to be completed by the 30th July. Their troops, 518,800 men, with 1584 guns, were then formed into three armies—the first under General Steinmetz, the second under Prince Frederick Charles, and the third under the Crown Prince.

The French had with difficulty collected 270,000 men with 925 guns by the beginning of August, and these were deficient in transport and equipment. The emperor assumed the chief command, and had 128,000 men between Metz and the frontier at Saarbrück, some 47,000 under Marshal MacMahon on the eastern slopes of the Vosges Mountains, and 35,000 in reserve at Châlons. The first engagement took place on 2d August, when General Frossard's corps drove out the weak German detachment in Saarbrück, but did not push its success, and the Germans took the offensive next day. On the 4th the third army (130,000) on the German left met General Donay's advanced brigade (5000 men) near Wissembourg (Ger. Weissenburg), defeated him, and pressed on to Wörth, where MacMahon had taken up a strong position with his main body (45,000). The battle fought here on the 6th was disastrous to the French, who fled in confusion through the Vosges Mountains. On the same day the battle of Spicheren was fought between 67,000 of the first German army and 32,000 of Frossard's corps, and ended in the orderly retreat of the latter. As a result of these disasters the emperor found it necessary to retire towards Metz, and, after the fierce and undecided rearguard action at Borny on the 14th, entered that fortress on the following day with 170,000 men and 540 guns. He then abandoned the chief command to Marshal Bazaine. Meanwhile the second German army had reached the Moselle, and was threatening with its advanced troops the roads to Paris. This was unknown to Marshal Bazaine, although he had a large force of cavalry which should have kept him informed of the enemy's movements. He ordered the retreat westward to continue, and his staff made the great error of directing the bulk of the troops to use only one, and that the southernmost, of the two broad chaussees available. At least seventy-two hours would have been necessary to complete the with-

drawal from Metz under these circumstances, and the Germans had already placed some cavalry across the road near Mars-la-Tour. On the 16th they were vigorously supported (as was invariably the case in this campaign) by other troops, and succeeded in stopping the westward movement of the French. Next day the latter concentrated on the Gravelotte position, eleven miles in extent. On the 18th the pitched battle of Gravelotte was fought, and resulted in the French being driven back on Metz. Here they were surrounded, and, after several gallant but unsuccessful attempts to break out, surrendered on 27th October.

Thus within a month the regular armies of France had been rendered powerless to oppose the German advance. But in the meantime the *Gardes Mobiles* had been called out, and, with the remains of MacMahon's army, formed at Châlons a body of 120,000 men, with 324 guns, much disorganised, and almost entirely without discipline. With these it was determined to attempt to join hands with Bazaine by a northerly march, which was commenced on 21st August, without intelligence reaching the Germans, part of whose second army was again in motion towards Paris. On the 25th the Germans learned, it is said through a telegram in a foreign newspaper, of MacMahon's movements, and at once changed the direction of their march so as to intercept him. The effects of want of discipline and contradictory orders had greatly delayed his march, and he was much harassed by the enemy, till finally on the 30th the 5th corps under De Failly, having encamped near Beaumont without taking the precaution of protecting themselves by a chain of outposts, though it had been engaged the previous day, was surprised and driven northwards on Sedan. Here MacMahon collected his dispirited troops, but only to find that the enemy had surrounded him, and by vigorous forward movements had captured the bridges over the Meuse and the commanding positions round the town. A fierce battle commenced early on the 1st September by the attack on Bazeilles. This village was captured by the Bavarians and recaptured by the French, and ultimately burned. By noon MacMahon had been wounded, and General Wimpffen as senior officer had taken command, only to find further resistance hopeless, in spite of the gallant charges of the French cavalry under General Margnérite, who fell at their head. Nearly 500 guns were playing upon the French, who were crowded into Sedan and under its walls, and at 5 p.m. the white flag was hoisted on the citadel. Next day the emperor, who was with the army, surrendered with 83,000 men.

On the 4th Paris was in rebellion, the senate dissolved, the empress-regent a fugitive on her way to England, and France proclaimed a republic amid tumultuous excitement. Before the close of September, Strasbourg, one of the last hopes of France, had capitulated, and Paris was completely invested by German troops; and on the 5th October the Prussian king had taken up his headquarters at Versailles. Gigantic efforts were made to raise armies in the provinces for the relief of Paris. Gambetta, escaping from the city in a balloon, joined the government at Tours, and by his energy got together many thousand armed men. These under the successive command of Generals D'Aurelle de Paladine, Chanzy, and Bourbaki fought stubbornly on the Loire, and with some slight success, threatening at one time to cut the German line of communications, at another to raise the siege of Belfort. But the surrender of Metz by Bazaine, and consequent reinforcement of the German armies round Paris, frustrated the first, and the masterly tactics of General von Werder on the Lisaine not only prevented the second, but

drove the French troops into Switzerland, where they were disarmed and interned. Whilst these events were occurring in the south and south-east, the Germans were overrunning the north as far as Dieppe, and fought a drawn battle with the French levies under General Faidherbe, who perhaps displayed more talent than any other French leader during the campaign. From Paris, where almost every able-bodied man was enrolled in the ranks, frequent sorties were made, and bloody battles fought in the villages to the east and south, Le Bourget, Champsigny, Le Hay, Bongival, Raincy, &c., several of which were taken and retaken more than once. The city also underwent a bombardment for several days, from which, however, it suffered little, and it was not till compelled by hunger in January 1871, after a four months' investment, that negotiations were opened with the enemy at Versailles. The united efforts of the different branches of 'the Provisional Government of Defence,' respectively installed at Paris and Tours, then succeeded in bringing about an armistice, and a portion of the investing army entered the city, which had been till then cut off from all communication with the outer world, except by balloons and carrier-pigeons, and finally threatened by famine. They remained but a few hours, and with the concurrence of Germany the French nation now proceeded by a general election of representatives to provide for the exigencies of the country.

*The Third Republic.*—The First National Assembly of the French Republic met at Bordeaux in February. After receiving from the Provisional Government of Defence the resignation of the powers confided to them in September 1870, the Assembly undertook to organise the government, and nominated M. Thiers chief of the executive power of the state, with the title of President of the French Republic, but with the condition of responsibility to the National Assembly. On the 1st of March the preliminaries of peace were finally ratified at Bordeaux, the chief conditions being that the province of Alsace (except Belfort) and part of Lorraine, including Metz, should be ceded to the German empire, and that France should pay a war indemnity of 5000 millions of francs, and continue to be occupied by German troops till the money was all paid. This enormous obligation was discharged in September 1873, and during the same month France, after an occupation of three years, was finally relieved from the presence of foreign troops. In the spring of 1871 the peace of France was seriously threatened by a successful outbreak at Paris on the part of the Communists; but, after great bloodshed and grievous damage to public and private property, they were quelled by the regular army, and on 20th May order was restored in Paris.

The difficulties which beset the French in the war commenced with bad organisation for collecting the reservists and mobilising the army. In contrasting the two opponents, it is remarkable how inefficient the fine French cavalry was in obtaining information, how slow one commander was to march to the support of another, how defective were the services of the staff, how little strategical talent was to be found among the generals, and how often ordinary military precautions were neglected by them. To these must be added most persistent bad fortune.

Since then France has been successfully trying to obliterate some of the numerous misfortunes resulting from the war, and commerce and national prosperity have very rapidly revived. The ex-Emperor Napoleon died in 1873 at Chislehurst, where he had resided with his family since his liberation in March 1871. His son was killed in

the Zulu war (1879). In 1873 M. Thiers resigned the office of President of the French Republic, and was succeeded by Marshal MacMahon, who appointed ministers willing to pave the way for the reinstatement of the French monarchy, under the descendants of the Bourbon dynasty. But the plan of a fusion between the two branches of the family failed through the action of the Comte de Chambord, whom it was intended to make king under the title of Henri V.; whereupon the monarchical majority in the National Assembly, in spite of the growth of republican feeling in the country, confirmed for seven years MacMahon's tenure of the presidency. Matters thus remained in suspense between a return to the monarchical principle and a thorough acceptance of the republic till 1875, when, by the accession of some Orleanists to the moderate republican parliamentary party, it became possible to pass constitutional laws for the republic. A senate and chamber of deputies represented the people; a president elected for seven years stood at the head of the government. The general election held in virtue of the constitution showed that France, under universal manhood suffrage, was now in favour of a parliamentary republic. A last attempt made in 1877 by the 'reactionary' parties to stem the tide of popular feeling met with a decided rebuff at the pollings. In presence of a republican majority both in the House of Deputies and in the senate Marshal MacMahon resigned his office (1879), and an out-and-out republican, M. Grévy, was appointed in his stead. Gambetta, the eloquent orator and leader of the republicans, who became after the death of Thiers the paramount political power in France, now led his party into courses of uncertain wisdom. The Communards were rehabilitated; the church was irritated by violent measures; the Tunis expedition was entored upon; public instruction, on the other hand, especially in its primary grade, was greatly developed. To their irritating attacks upon the Orleanist, Legitimist, and Bonapartist parties, representative relics of France's former political states, and upon the Roman Catholic Church, the largest and most united corporate power in the country, the republicans soon added internal discord, and suffered from their inexperience of parliamentary government. The true conservative power in France, the body of peasant proprietors, began to include their chosen representatives in their distrust of all politicians. Republican prospects became clouded through Gambetta's accession to the premiership and his failure to keep it; through his death (1882), which left his party without a leader and the people without an idol; through the weakening of French influence in Egypt, less owing to English action than to the vacillating policy of the ministry (1882); through the Tonquin expedition and embroilments with China, which cost many lives and much treasure without perceptible returns; through accusations of jobbery and malversations brought against M. Grévy's son-in-law, which resulted in a change in the presidency by the resignation of the former, and the election of M. Carnot (1887). The election of 1885 showed that the republic had lost ground, and the infatuation of a large section of the electors for General Boulanger (1887), supported by the reactionary parties in his schemes of personal political aggrandisement, while doing little to unite the broken front of the republican majority, put in jeopardy the rational, practical, and undoubtedly liberal parliamentary institutions which the third republic had been instrumental in implanting in France. In 1889 the French held their fourth universal exhibition; and the general elections in the autumn effected a final settlement of the

duel between Boulangists and Constitutional Republicans. When all the uncertainties of the situation are summed up, and in spite of the permanent threat of a war with Germany, the fact remains that France, since the defeat received at the hands of that country, has immensely improved its material and military resources, and taken a long stride towards a healthy, well-regulated, peaceful, national life.

LANGUAGE AND LITERATURE.—The French language belongs to a family which offers unusual interest and exceptional facilities for philological and literary study. From the standpoint of the English scholar it appears better suited than any other modern tongue to impart a sense of genesis in language, and by analogy and parallelism in almost everything else. It is the best specimen of its kind, because the decomposed soil from which it springs—Latin—is school property; because the successive states it has gone through are visibly marked on its material and in its significance; because its line of development, diverted from Roman culture, lies across the richest and most accessible historical ground. Moreover, since the rise of modern philology, no language has been subjected to more patient and more profound research, nor has any repaid more fully the labour expended upon it. No greater monuments of linguistic science have been erected than the special literature produced mainly in Germany and in France by the students of French philology; so much so that one's admiration is divided between the intellectual penetration which has discerned the laws of growth in the French language, and the marvellous fixity and regularity of these laws themselves. Long before the Romans conquered Gaul their speech was already undergoing certain specific changes, whence in due course and in the proper places the modern languages of Italy, Roumania, Spain, Portugal, and France would take their rise. These changes consisted principally in the weakening or dropping off of primitive elaborate case inflexions, the suppression of short vowels between consonants that could with ease be pronounced together, a gradual increase in the stress laid in pronunciation upon the accented syllable, the use among the Roman plebs of forms and words not accepted in the polished classes of society, and the tendency to depart from the earlier and synthetic modes of expression in order to introduce into the mechanism of speech a new class of words, which slowly took the place of perishing case and verb inflexions.

Through Latin, its ancestor, French belongs to the

Aryan stock of languages. Along with its sister-languages, Roumanian, Italian, Spanish, and Portuguese, it sprang into being when soldiers, colonists, and merchants, in the course of several centuries of Roman domination, had saturated western and southern Europe with their *lingua romana rustica*, or common Latin speech, an essentially popular and unliterary form of utterance, but forcible and instinct with an irrepressible vitality. This Latin of the Roman people and of their European possessions is known to philologists in the shape it received after the invasion of the barbarians and through the admixture of Teutonic elements, under the name of Romance. It is as it were a vegetable mould, spread to a great depth over the surface of western and southern Europe; and from its common properties were formed, by a process of differentiation, the special and localised soils suited to bring forth ultimately the distinct literatures of Italy, France, Spain, and Portugal. In France Romance gave birth to Old French, which can be divided into three successive periods—the period of formation, the flourishing period, and the period of decay. The first is contemporaneous with the earliest middle ages, and its origin, like that of French history, dates back to the conquest of Gaul by Rome. The Celtic dialects were overpowered by the *lingua romana rustica*. While the masses spoke popular Latin, the literary dialect of Cicero was written and spoken by the educated and governing class: it was a class language, and continued so till the church was left alone in possession of this effete legacy of ancient Rome.

The *lingua romana*, according to a law inherent in every language, was already assuming local peculiarities in different parts of Gaul when the first move towards the formation of a French language, the campaigns of Julius Cæsar, was completed by a second, the settlement in Gaul of the Frankish, Burgundian, Saxon, and Gothic tribes from beyond the Rhine. The formation of different dialects received fresh impetus from the complete disruption of the Roman power in the West. From that day, the processes of decay, which till then might be considered as modifications within the *lingua romana*, assumed a regenerative character and became the starting-point of a new language. To the Franks has fallen the honour of having their name attached to it. This Germanic title has by no means affected the inner construction of the language. Teutonic influences can be traced in goodly number in the vocabulary and phonetics of Old French; but the grammatical framework and the syntax, which developed only in the late stages of Old French, are wholly and absolutely Latin in origin and Latin in spirit. Language in Gaul, as elsewhere, ran into types: dialects, whose primary causes are obscure, were formed. In the valleys of the Rhone and of the Garonne, in the whole country (very nearly the half of modern France) verging to the Bay of Biscay, from the mountains of Auvergne southwards, early French was not French; it inclined to the Italian and Spanish modifications of Romance on which it bordered. These southern dialects, known under the collective name of *langue d'oc*, fell out of the race for supremacy when the centre of political and military power in Paris became strong enough to absorb the Mediterranean border in its circle of influence. By degrees inner troubles and invasion from without deprived the southern speech of its national significance as a body of language. Nowadays Provençal (q.v.) is for the people a patois, for literary antiquaries and philologists a curious study. Its victor, the *langue d'oïl*, the parent of modern French, has had a triumphant career. Geographically, to it belonged the valleys

of the Saône, Loire, Seine, Scheldt, and Meuse. Scholars recognise four dialects in it. The dialect of Paris became paramount after the building up in Paris under the Capetian kings of a natural centre for the gradual nationalisation of France. The culminating point of Old French was reached when it had evolved fully its 'half synthetic system' in the 12th century.

The language thus shaped brought forth a stupendous amount of literature. For two centuries medieval French was the polite language of Europe, more so than modern French has ever been; for after the early but transient literary outburst of the *langue d'oc*, and before the dawn of the Italian Renaissance, French had no rivalry to fear from still shapeless contemporaries. It was currently held till within the last fifty years that French literature had its roots in the Augustan age of Latin culture, and that the Hellenism of the Renaissance was the first air in which it flourished. The mythological apparel of French poetry and the classical rhetoric do admittedly proceed from that source. But hearts beat and imagination wove its webs of fancy in France ages before scholars imported the literary finery of Greece and of Rome. The natural trunk of French literature, if not of French letters, casts its roots in the same soil whence the language sprang. Language, nationality, and society are even in the middle ages the constituent elements of history, and the true nature of the times is better elicited from them than from the records of military violence.

In the flourishing period of Old French, society is feudal, its character is the division of men into four sharply defined classes: the nobility, whose occupations were mainly martial, and who in consequence fostered an epic literature; the burghers, among whom are first found the more strikingly national points—common sense, wit, good-humoured satire, gracefulness, a fresh and nimble style; the villeins, affording to the burgher plentiful material for jest; the clerics, including the clergy and all professional men, who spoke and wrote Latin, and who when they took to writing in French brought to it the older language's historical and philosophical qualities. Those four classes had their being between the four walls of medieval immutability—the Catholic religion, feudalism, monarchy, and the grossness of their world-conceptions. Thus rough-hewn, French society, from the 11th to well into the 14th century, assumed and preserved throughout the Crusades, throughout the struggle between emperor and pope, in spite of the annexation to England for a time of a large portion of France, the proud position of master and arbiter in matters of the intellect and of social commerce. The deeds of war of the Frankish kings of the Merovingian and Carlovingian dynasties called forth French epic poetry. The appearance of Clovis as the champion of the Catholic faith against the Arian heresy, of Charles Martel as the protagonist of Christendom against the Moslem Arabs from Spain, of Charlemagne as conqueror of the heathen Saxons in Germany and of the Mohammedans on the banks of the Ebro, fed an ever-swelling strain of song till it rang its loudest in the *Chanson de Roland* (11th century). Round this epic poem, struck up by the Norman *trouvère* at the battle of Hastings, further royal, feudal, and biographical epics ranged themselves, almost all grounded on fact, some borrowed from antiquity, some suggested by the Crusades, some imported from Brittany. The last class may be claimed by Great Britain as derived from the literary fund of its oldest inhabitants; for, when the Celts of Britain had been driven from the east coast by the Angles and the Saxons, a part of them crossed the sea to French Brittany, taking with them the

legend of King Arthur. Those who remained in Wales, after charming their Teutonic conquerors by their gift of song and poetry, fascinated with still greater ease the Normans romanised by their long stay in France. Their *Round Table*, *Perceval*, and *Lancelot* were incorporated in Anglo-Norman literature, till they won for French in their continental form the prize of narrative poetry. From France those romantic stories passed into the Netherlands, Germany, Italy, and the Spanish peninsula, carrying everywhere that air of chivalry and gallantry which in matters of the imagination gave an ideal to society and constituted its moral unity. In the middle of the 13th century the purely epic cycle and the romantic cycle engrafted upon it were complete. Then came in verse the opportunity of the story-teller and in prose that of the chronicler. The French fabliau or tale is unequalled for wit, humour, alertness, good-tempered malice, and refined mockery, with a strong dash of the salt of coarseness. The Voltairean spirit already tripped lightly about, and the fabliau writer, in his swift, pointed treatment of social matters, is the forerunner of the *esprit Gai* and Parisian vivacity which feed a distinct current in the stream of French literature. Boccaccio and Chaucer drew much material from the French elaboration of tales hailing from all quarters of the globe.

Whole collections of fables were fathered upon Æsop, dubbed to that purpose with the familiar name of Isopet. By degrees the short fable was succeeded by long semi-epic, semi-satirical compositions, in which a moral was aimed at man by the transference of social relations to the animal world. The *Roman du Renard*, the most representative and most comprehensive of these productions, was imitated and translated everywhere, and its more interesting parts have remained a common possession of all literature, suggesting for instance the Flemish *Reynaert de Vos*, and finally appearing as Goethe's *Reineke Fuchs* in modern literature. In the 14th century the latest French compilation of Mr Reynard's exploits throws a deal of light on the society of the time. It expresses the ideas of the comparatively wakeful and wealthy middle class then occupying the large towns, their hatred of the lauded aristocracy, and indifference to the villein's lot. The French have to thank the Crusades for their first histories. Some of these belong to Anglo-Norman literature, and recount the deeds of France's ally, Richard Cœur-de-Lion. But they are outshone by Villehardouin's *Conquête de Constantinople*, the masterpiece of historical composition in the middle ages proper. He reminds us of Herodotus as the *Chanson de Roland* reminds us of Homer. The sixth crusade and the life of Louis IX. are the subject of Joinville's *Mémoires*, while various causes resulted in an outburst of French or rather Anglo-Norman historical productions in England which did not extend beyond the beginning of the 14th century. History in the middle ages being heroic, epic, and chivalrous rather than didactic and philosophical, the aristocrats provided the clerics with the material and spirit of its treatment. But as time wore on the latter in their turn enriched French literature with branches that are entirely their own. They began to write in the character of students and scholars, of moralists, caricaturists, educators, dramatists, and professors of religion. Their most important contribution to general literature is the *Roman de la Rose*, a vast allegorical treatment of the lover's woes and the lover's bliss in the pursuit of the object of his passion. begun by Guillaume de Lorris, the poem was continued and diverted from its original purpose by Jean de Meun; it became popular throughout

Europe in the multitudinous artificially-cultured court circles of the 14th century. It passed into the Dutch, Italian, and English languages. It imparted its character to French literature till the end of the 15th century, was transcribed and printed during 300 years, and stands in an indirect relation to the 'romans' and 'précieux' works of the 17th century. Lyrical poetry has, properly speaking, no cradle of its own within the strict limits of French medieval literature, for it was brought thither from a sunnier, warmer, and softer southern air. Italian, Spanish, and the *langue d'oc* were the natural and early vehicles of lyricism in Europe. Of these three languages the last named was the first to bear fruit. There prevailed in Provence some particular rules of etiquette and of good breeding, upheld by a brilliant society in which women held the foremost place. The troubadours in their lyrics held up the mirror to that society and reflected its tastes. When the south had fallen a victim to the ban of persecution and military supremacy extended upon it from the sterner north, the art of the troubadours found in the 13th century a temporary abode in Champagne, Picardy, Flanders, and Artois, whence it passed to Germany, to Italy, to Sicily, to Spain, to Portugal, inspiring everywhere the first aspiring attempts of nationalities whose languages have since proved themselves to be, as lyrical instruments, superior to the French.

The 15th century witnesses the linguistic transformation of Old French into Modern French. The last traces of case inflection disappear, the analytic form of language supersedes in all essential parts the half-synthetic system. The French mind acquires these qualities of reflection, French thought takes that philosophic turn which distinguishes the idealism of the intellect from the idealism of the imagination. Froissart, in his *Histoires*, yields an inquiring as well as a picturesque pen. His successor, Philippe de Commines, the historian of Louis XI., is still more of a moralist and of a politician. Charles d'Orléans, snatching from the perishing troubadours the thread of lyrical poetry, passed it to Villon, who wove into its silk many a coarse hempen filament, till Clement Marot raised French verse to religious solemnity in his translation of the Psalms, preserved its grace in his epistles, and gave it a pathetic ring in his elegies. In the meanwhile the Italian Renaissance was filling with its glory the world of art and of literature. Native and spontaneous literary activity was paling before the light of the revival of learning. With the accession of the House of Valois to the throne we find at once that the spirit of France has passed away from the old into a new society and a new literature. France will now receive the lessons of ancient Rome, ancient Greece, and modern Italy before it does again original work and resume its supremacy in Europe. French society becomes polished, its local provincial centres die out, and culture flourishes in the court of the king. Francis I. is proclaimed the father of letters. The state is organised, there is a general intellectual impulse, women are promoted to the place of honour in social and court life. French officers, sent year after year at the head of French troops to Italy by Charles VIII. and Louis XII., brought back a knowledge and a love of art and letters. Italian architects built mansions for them and palaces for the royal family. Italian painters and sculptors hung pictures and set up statues in their halls. Italian scholars interpreted for them the masterpieces of Roman and Greek literature. No longer mere power or physical prowess, but mind was the object of a gentleman's ambition. It became the fashion at court to show enlightenment by attending the preachings of the Reformers. Francis I. laid the foundation of the Bibliothèque

Nationale and of the Collège de France. He, and his sons after him, encouraged artists and scholars. Paris numbered then 500,000 inhabitants, of whom 15,000 were students.

In the general excitement of the Renaissance and the Reformation, literature could not but move in the same direction as society at large. Italian comedy ousted the *mystères, sotties, and farces*; the imitation of Greek and Latin authors reduced the flow of inspiration in poetry, and burdened it with artificial rhetorical rules and with a mass of ill-advised borrowings from the Latin vocabulary and from the Latin syntax. Ronsard and his *Pléiade* stood in the van of this movement, which Régulier endeavoured to stem, while Rabelais, mixing the new material with the old in an ill-assorted, stupendous mass of cumbersome learning, low jesting, high thinking, and word-rioting, came near being the burlesque Shakespeare of his age, whose energies are best represented in we know not which of the numerous veins running through *Gargantua* and *Pantagruel*. No two minds could be more different than those of Rabelais and Montaigne, the great prose-writers of the 16th century, yet only the Renaissance could produce either; the first, with his reason driven wild in pursuit of the visions of his imagination; the second, a blithe Greek sage, carrying his wisdom lightly and discomfiting as if arm in arm with Plutarch, his model. Rabelais, Montaigne, Calvin, and Descartes, by setting French prose on the basis afforded by the revival of learning, drew to themselves some of the attention then given to Italy. Poetry was rescued from Ronsard's exaggerations by Malherbe only to be tapered down almost out of existence by over-much attention to elegance, refinement, lightness, and style. Looking forward through the spans of time, we find that, divorced from nature and limited to the expression of the social emotions, poetry is poetical with Lafontaine only in his *Elegie aux Nymphes de l'Yonne*, with Racine only in the choruses of his tragedies. As for the professed lyric poets of the 17th and 18th centuries, their performance bears the impress of the sterility and rhetoric of their Latin models. J. B. Rousseau, Lefranc de Pompignan, Lebrun, and Pindare are worse sinners in this respect than Racan, Chaulieu, and Parry. Lyricism finds better interpreters in church orators, such as Bossuet (*Oraisons Funèbres*), Bourdaloue, Massillon, and Fléchier, all of the 17th century. It pervades the glowing pages which love of nature and effusion of sentiment dictated to J. J. Rousseau and Bernardin de St Pierre in the later part of the 18th; it dwells in the religious fervour of Chateaubriand and in the passionate enthusiasm of Madame de Staël on the threshold of the 19th. André Chénier was the first to restore some soul to poetry, in the pure Greek note which he sang during the horrors of the Revolution.

Such a long eclipse is partly explained by the premature application to literature of standards of taste and of formal criticism. Malherbe subjected his talent to a personal discipline which Boileau consolidated into a set of rules enforced with the lash of satire. Corneille wrote his tragedies early enough to remain comparatively free from this rod, but Racine acknowledged Boileau as his master. The 17th century is in France the age of authority in literature as in everything else. The French Academy, founded by Richelieu in 1635, to establish positive rules for the French language and to render French speech not only elegant, but also fit to present all arts and all sciences, gave an earnest of its future labours by an endeavour to curb Corneille's waywardness in composition. Public opinion at court and public opinion in town circles—for Paris was becoming a centre of culture and thought, forming together with the court the whole

of French society—fell by degrees into line with the Academy and with Boileau. Thus was formed, along with French unity, the unity of French literature, and to this period is ascribed the name *classical period*, to distinguish it from the period of liberty and individualism ushered in after the Revolution and the Empire, by the rise of liberalism in politics and the return to freedom in the matter of prose and verse composition. As long as town and court moved together in the same direction, the unity of French thought, of French literature, and of French political development remained unimpaired and produced its fruits good and bad. After Corneille's sublimity and his representation, not without some Spanish staginess, of the conflict of duty and passion in heroic human breasts, came Racine's polished and courtly expression of the agitations of the heart. Molière, the greatest French painter of men from life, showed himself in his *Tartuffe* the scourge of hypocrisy; in his *Misanthrope* he was austere and touching; in the *Femmes Savantes* and in the *Précieuses Ridicules* he exposed the false and pedantic erudition of the woman of the period; in the *Acare* he related the plight of an unconscious miser; playful withal, castigating with sobriety, ruthlessly just and gently forgiving, uproariously funny and immensely suggestive, acting his parts himself in the happiest fashion, using the sharpest, tersest, and brightest French. Regnard followed him, but far behind. Then came Destouches, Le Sage, Piron, Gresset, Sedaine, without Molière ever having a rival, except perhaps Lafontaine, whose fables, conceived in the same inimitable French vein, are one and all natural or comic little dramas in which an apparently artless exhibition of the ways of animals and things leads to a neat moral applicable to man. Florian followed in his footsteps at a respectful distance. Madame de Sévigné gained a place for letter-writing as a distinctly French art, an accomplishment in which many Frenchwomen have excelled after her. In contrast to Bossuet's Hebrew-like eloquence and militant ecclesiasticism stood Fénelon, gentle, suave, and versatile, ever healing wounds and pointing a warning finger to dangers ahead. Totally different from either of them had been Pascal, an introspective pessimist oddly placed in the vestibule of an imperial age, wrestling with doubt, bending the language to his intellectual agony, and planting upon the Jesuits the stigma of his honest, piercing satire. La Rochefoucauld, who wrote his contribution to moral philosophy before La Bruyère, was also a memoir-writer, a gift in which Cardinal de Retz, the naturalised Scotsman Hamilton, and the Duc de St Simon all excelled.

Amidst the mistaken foreign and home policy which was striking at the very roots of the nation, French literature offered towards the end of the long reign of Louis XIV. a spectacle of imposing intellectual force. France established thereby so well its claim to the leadership of society and literature in Europe that, thanks to a full in native literary production, as in England, or to a comparatively backward state of culture, as in Germany, or to a paralysis of the national vigour, as in Italy, the French 17th century might seem to protract itself in all these countries even at a time when a total change was passing over French society, and pointing its literature in a new direction. The age of Louis XIV. was, above all things, that of a well-balanced literature, the work of men whose nerves are not upset, who are fully satisfied with the work suggested by their situation. Their stock of ideas was adequate to their power of treatment, and nothing came to mar the dignity and gravity with which they approached their subjects. There is a wholesome moral tone underlying their performance, and the

kind of repose bred from the illusion that one's work is final. But Louis XIV.'s senility and fanaticism, and after him the license and unscrupulousness of the regent, disorganised the court; a larger number of thinking and able men collected in Paris than the service of the state and of the church could occupy. Parisian society, once educated by the court and long led by it, broke away, and violently rebelled against an irksome tutelage. It returned to freedom first, then it welcomed adventurous minds which abandoned troublesome spiritual and moral loyalties to swell the ranks of drawing-room malcontents, while below them soothed a large class of *intrigants* and schemers recruited in the overgrown establishments of noblemen and courtiers. Literature, from being an art in itself, became subordinate to ideas; by an enormous influx of ripening thought it became a vehicle for hitherto unexpressed political, moral, religious and scientific matter. Till 1750 the disintegration of the old social body remained latent. Still, Montesquieu's *Lettres Persanes* and his *Considérations sur la Grandeur et la Décadence des Romains* announced plainly enough the advent of social satire, and the application of philosophic method to the study of political history. But his *Esprit des Loix*, by showing the interdependence of physical and moral laws and the conditions to which is subjected the legislator's apparent liberty, marks a clear departure from the traditional theories of government.

The great mouthpiece of the spirit of the age, Voltaire, belongs still in pure literature to the times of Louis XIV. His tragedies are classical, his literary criticism is that of Boileau, his poetry is an academic display of wit and sociability; but the remainder of his works form a complete battery in which his tales represent the light artillery and his histories the heavy guns. Combining passion with philosophic acumen, strangely divided between vanity and generosity, the personal friend of kings and the advocate of individual and popular rights, preaching tolerance and openly undermining public respect, deep in prejudice and the enemy of superstition, he showered upon the tottering edifice of French society pamphlets, treatises, letters, discourses, epistles—all of them shafts pointed with sarcasm, finely weighted with a touch of plausible learning, and feathered from the wing of his sparkling imagination. He was assisted in his incessant warfare by a host of talented and original thinkers. Sensualistic followers of Locke, like Condillac and Condorcet; combative materialists, like Helvétius and D'Holbach; encyclopedists, headed by Diderot and D'Alembert; earnest moralists like Vanven-argues; writers of novels and plays with a purpose, such as Le Sage and Beaumarchais, or with the object of minute psychological analysis, such as Marivaux and l'Abbé Prévost; naturalists, like Buffon and Bernardin de St Pierre, showed each in his own department of letters, art, or science, many even in several departments at once, one common spirit and an identical zeal by which all thinkers and writers, often unknown to themselves, worked in concert as if holding of malice prepense an intellectual Pentecost. The age was too much in earnest for plain comedy; it was too bitter for poetry; Gilbert almost alone wrung a true cry from his heart; Crébillon writes some overwrought tragedies, and Laharpe stands forth as the last critic of the Boileau school.

At this juncture J. J. Rousseau appeared to complete Voltaire. Born in Geneva, where the political institutions towards which France was moving were partly in existence, early weaned from an atmosphere still nominally Calvinistic, professedly at war with the philosophers, he gave them the support of his persuasive eloquence,

passion, imagination, inspiration, enthusiasm, heating in fact their cold intellectualism with an emotional fire that quickened the seed of mischief, and raised the nation's pulse to fever-heat, till even Rousseau's voice was lost in the clamour of the Revolution. He broke fresh ground in the science of politics by his *Contrat Social*, in the art of education by his *Émile*, in pure literature by his *Nouvelle Héloïse*, painting a picture of more natural morals, often greatly at variance with morality. An unworthy son of the society of his day, he passed condemnation upon it. In the year after his death the political assemblies began the realisation of his ideas. Thus literature, at work among other causes, led straight to the Revolution. The ring of Mirabeau's oratory was heard for a few years above the turmoil in which perished the poet André Chénier.

As long as the axe did execution in France, and as long as Napoleon's sword held sway in Europe, literature did not raise its voice. Madame de Staël drew her inspiration from without, though mentally and emotionally in touch with J. J. Rousseau. She called the attention of France to the benefit it could derive from the study of independent foreign literature, such as the nascent literature of Germany and the established literature of England. She showed that the poetry of the Renaissance, derived from the ancients, elaborated into formal classicism, burdened with pagan associations, and modernised in Italy and Spain, could not be compared with the hidden bubbling springs welling forth in the chivalry and cathedrals of the land, and flowing from the lips of the greatest poets out of France.

By doing away with every sort of restriction and privilege the Revolution imparted a new unity to the French nation, immensely developed the function of the middle class, and threw open vast prospects to its hopes and ambitions. Becoming the centre of gravity of the nation, and holding in its hands the reality of power, it re-echoed the ideas of Madame de Staël. Chateaubriand, finding in a return to medieval ideals the proper food for his imagination and the right colours for his style, unwittingly favoured her liberalism. Then Lamartine stepped forth as the lyrical poet long looked for in vain, revealing in his reposeful, tuneful lines, often sad, and ever bathed in a dim religious earnestness, a beautiful and sympathetic side of French poetic sentiment which had never yet found a mouth able to utter it. A whole school of lyric poets followed in Lamartine's footsteps—Alfred de Vigny and Victor de Laprade being among the greatest. Casimir Delavigne is not free from the besetting sin of rhetoric, and Victor Hugo was master of too many instruments besides the lyre to be classed here. His position is that of founder and head of the French romantic school, as the men called themselves who threw off all allegiance to the classical traditions. He philosophised for his followers on romantic aesthetics, explaining what relation ugliness bears in art to beauty. He applied his doctrine in a series of dramas, to one of which, *Hernani*, the romanticists nailed their colours and compelled the public to bow. From 1830 to 1835 Victor Hugo was in all kinds of literature, at first an initiator, then a revered and victorious chief, and during his old age an idolised master. Under his leadership formalism was excluded from the technique of poetry; ingenuity and a free adaptation of rhetorical means to poetical ends taking the place of compulsory standards. In prose style was left similarly to individual initiative; the language being boldly bent to the purpose of the writer, and receiving its moulding from the originality and character of his mind. There was no longer a question of imitating set

models and complying with fixed precepts. Expression received its form from within. Hence a new, multiple, and often eccentric art, seeking too much after the pictorial and sensational significance of words, a general strain on the resources of language and of literary expression, but a profusion of striking effects, and the transference to the pen of many capabilities belonging properly to the brush, the pencil, or the chisel. Victor Hugo inaugurated thus a new method in literary composition. Taste and wit became of less moment, because literature no longer rested upon society as a whole, but upon the nature of each individual writer.

Romanticism represented three things: a return to ideals medieval, a recoil from ideals classical, and the awakening of modern France to its own ideals. Victor Hugo embodied all this in his long career. Royalist and Catholic at first, he sang odes to the past; adversary of the Academy and of the Théâtre Français, he gained seats in the first for his followers and the boards of the second for his and their dramas. Then, interpreting the inner life of the bourgeoisie, he wrote for them the poetry of their daily musings, of their affections, of their children. Next, led on to liberalism and to the breadth of human charity, he with one hand branded Napoleon III., with the other revealed what gleams of spiritual beauty shine unknown in the hearts of the lowest and poorest, while his imagination wrought into epic poems the history of the world and the destiny of man. Nobody ever did so much with words, and words never did so much for any one. The aesthetics of romanticism bore fruit in the transformation of dogmatic criticism into literary history. Sainte-Beuve applied the theory of the new practice with so much success that the critique of art and literature, always a favourite pursuit with the French, but long a cause of weakness, became one of their strongest points, and most beneficial to all literature. With him, Villemain, and Scherer, literary history became comparative as well as personal. To attempt an enumeration of Victor Hugo's followers, or of the writers in any given field, would break the proportions of this general survey, besides conveying a wrong impression, for it is a feature of this century that the activity of talent pervades several fields, and expresses itself in verse and in prose almost indifferently. Lamartine, for instance, was an orator and a historian as well as a poet. Victor Hugo was still more discursive. Few men sat down to their work with the intention of deriving their inspiration from the nature of their subject only. Subjects were rather chosen as themes, and their treatment showed a complicated compromise between man and thing. Michelet's history, for instance, is not separable from Michelet. After the first ado of the romantic movement, which immensely broadened the stream of French literature, the old and new flood mixed their waters and ran as it were into four principal masses. Poetry became more and more of an art and less and less of a substance, except in Alfred de Musset, who rivalled the finest performance of Lamartine and Victor Hugo without sacrificing his originality to either, sometimes toying with life, sometimes sneering at it, sometimes uttering the cry of man unredeemed from vice, crushed in sorrow, and bound in weakness, in a voice so true, in so sweet a melody, that he is the most loved of French poets. Below him stand the Parnassian poets, Leconte de Lisle, Bandelaire, Sully-Prudhomme, François Coppée, and, among his minor contemporaries, the satirists Barbier and Barthélemy, Brizeux, the two Deschamps, the ultra-romanticists Gérard de Nerval and Théophile Gautier.

The drama, to which Casimir Delavigne, Alfred

de Vigny, and Alexandre Dumas laid stepping-stones for Victor Hugo, fell after him into the hands of the semi-classicist Ponsard, of Augier, Feuillet, Alexandre Dumas fils, and Sardou. The comic stage, occupied by the rapidly-constructed and rapidly-vanishing productions of Scribe, only seldom saw a real comedy. But as a set-off some of the old comic force entered now and then into the romantic drama, and trickled into many novels and romances. These were a genuine growth of the times, and, for variety, artistic treatment, psychological analysis, they rank high above every novel published before, with the exception of but a few to which they are historically affiliated. Novels are fantastic with Ch. Nodier, historical with Alfred de Vigny, realistic with Mérimée, Balzac, Flaubert, and Daudet, panoramic with Alexandre Dumas the elder, homely with Sandeau. George Sand, possessed like Madame de Staël of almost masculine gifts, and, like her, one of Rousseau's disordered kindred, exhibited in herself and in her books the play of the passions in their natural state, till she poured forth her mellowed ardour in pure idyls of country life. There is but a distant affinity between the 'realism' of some of the preceding writers and the naturalism of the brothers De Goncourt, Zola, Guy de Maupassant, and Paul Bourget. A wave of liberalism in the Roman Catholic Church bore Lamennais, Lacordaire, and Montalembert to oratorical fame, while Renan shone in church history, Cousin and Auguste Comte in philosophy, Taine in scientific psychology. Béranger stood almost alone in having but one specialty. A liberal, though under the spell of the Napoleonic military glory, he raised to an art his turn for penning popular songs. The analytical qualities of the French mind and its power of constructive writing were nowhere better displayed than in the department of history. A. Thierry with fidelity and picturesque quality, Guizot with some heaviness, Thiers with patriotic complacency, Quinet and L. Blanc with too much passion, Michelet with an excess of the poetical faculty, De Tocqueville with breadth and insight, attached their names to some masterly work.

In France more than in any other country mental power is accompanied by the literary faculty. Hence all science and manner of erudition claims a place in literature. An inquirer going the round of the interests of civilised man would with difficulty find an object of study or a branch of culture in which the French could not offer a model of presentment. Their literature is marked by symmetry and fullness in its successive periods, by continuity in its unity and variety, by evenness in its distribution over the pursuits of man, by regularity in its function towards society, by the amenableness of the people to its influence. Literature is a mightier instrument with them than elsewhere. They quickly respond to it. The susceptibility of the national character, its somewhat feminine eagerness and quickness of perception, which keep society as it were in a continual whirl of integration and disintegration, and ideas in perpetual revolution, are the very endowments which make their literature the most uniformly readable of all. With a little less of the mind-quality about them, they would be happier and wiser, perhaps, but Europe would be duller and poorer.

The history of the French language may be studied in the dictionaries of Diez, Scheler, Brachet, Littré, and Godefroy; its grammar in such books as those by Diez, Bartsch, Brachet, and Gaston Paris. The last commenced his *Manuel d'ancien Français* (11-14th century), including a summary grammar, selection of texts, and glossary, with an admirable volume, *La Littérature Française*

an *Moyen Age* (1888). Many invaluable contributions to French philology have appeared in the pages of *Romania*, founded at Paris in 1872, and edited by Paul Meyer and Gaston Paris; and of the *Zeitschrift für Romanische Philologie*, founded at Halle in 1877, and edited by G. Gröber. The Société des Anciens Textes has issued many texts since its foundation in 1872; the student may also be directed to Dr Wendelin Förster's *Altfranzösische Bibliothek* (i.-xi. Heilbronn, 1881-88), and to Suchier's *Bibliotheca Normannica* (3 vols. Halle, 1879-85).

For the history of the literature, the first work to be named is the monumental and magisterial *Histoire littéraire de la France*, begun by the Benedictines and continued by members of the Institute (i.-xxx. 1733-1838), but not yet beyond the middle ages. More accessible for mediæval times are the works of J. J. Ampère, Léon Gautier, Gidel, Albert, and Aubertin. For later times one of the best books is Godefroy's still unfinished *Histoire de la Litt. Franc. depuis le 10<sup>me</sup> Siècle jusqu'à nos jours* (9 vols. 1859-81). Sainte-Beuve, and Darmesteter and Hatfeld have devoted special study to the 16th century.

For the 17th century may be named the works by Voltaire, Demogot, Laharpe, Sainte-Beuve, V. Cousin, and Fourniel; for the 18th, Barante, Villemain, Bersot, Albert, John Morley, E. and J. de Goncourt; for the Revolution, J. Chénier, Gérin, and the works of Maron, G. Merlet, and the brothers De Goncourt.

For the 19th century and modern times may be named the special books by Charpentier, Merlet, and critical essays on contemporary writers by Vinet, Sainte-Beuve, Villemain, Montégut, Prévost-Paradol, A. Pontmartin, Caro, Taine, Scherer, Paul de St Victor, G. Planche, H. Etienne, St René Taillandier, Janin, Saint-Marc-Girardin, Lemaître, Bourget, Pollock, Saintsbury, and Henry James.

Good manuals covering the whole ground are the books by Nivard, Demogot, and Gêruxez, and by Van Laun and G. Saintsbury in English. Walter Besant's *Early French Poets* and his *French Humourists* are also serviceable English books. The reader is referred also to the articles on the chief French writers in this Encyclopædia, as well as to CHANSONS DE GESTES, DRAMA, FABLEAUX, NOVELS, and the like.

**France, ISLE DE.** See MAURITIUS.

**Francesca da Rimini**, the beautiful daughter of Giovanni da Polenta, lord of Ravenna, was given in marriage to Giovanni the Lame, son of Malatesta, lord of Rimini, on the conclusion of peace between the two houses. But her heart was already given to Paolo, Giovanni's brother; and in 1285 Giovanni, surprising the two lovers together, slew them both. The incident is woven into the *Inferno* of Dante. See Yriarte, *Francesca de Rimini dans la Légende et dans l'Histoire* (Paris, 1882).

**Francesco di Paula**, or ST FRANCIS OF PAOLA, founder of the order of the Minims, was born in 1416 at Paola or Paola, a village of Calabria. At the age of thirteen he was the inmate of a Franciscan convent; and at nineteen he retired to a cave where he inflicted on himself every species of self-mortification. The fame of his piety having attracted to his cell several emulators of his austere life, he obtained permission to erect a convent, and the new community received from Pope Sixtus IV. the title of the Hermits of St Francis of Assisi; but the title was changed by Alexander VI. to Minim-Hermits of St Francis of Paola. The founder established numerous communities in Italy, Sicily, France, Spain, and Germany, but the Minims were never settled in Great Britain or Ireland. To the usual conventual vows, Francesco added one of the most rigorous abstinence—flesh, eggs, cheese, and milk being strictly forbidden the entire year, except in illness. Popular report having attributed to Francesco several wonderful cures, Louis XI. of France, being ill, summoned him to his presence. Francesco was received with the highest honour, and attended the king on his death-bed. Charles VIII. and Louis XII. induced him to settle in

France, and built him convents at Plessis-lès-Tours and Amboise. Francesco died at Plessis on Good Friday 1507, and was canonised in 1519. The habit of the Minim friars is a gown of coarse undyed woollen stuff, and formerly they went barefoot or with sandals only.

**Franche Comté**, an old province in the east of France, in the basin of the Rhone, corresponded to what was at one time known as the County of Burgundy, and comprised what now forms the departments of Doubs, Haute-Saône, and Jura, and had for its capital Besançon.

**Franchise**, originally 'freedom,' but usually 'a privilege;' in England especially a royal privilege or exemption, belonging to a subject by prescription or conferred by grant. The franchise is the right to vote for members of parliament or congress. See PARLIAMENT, CONGRESS, and the sections on government in the articles on the various countries.

**Francia**, JOSÉ GASTAR RODRIGUEZ, usually called Dr Francia, Dictator of Paraguay, was the son of a small landed proprietor, of French or Portuguese origin, and was born near the town of Asunción about 1757. He studied theology at the university of Cordova de Tucumán, took his degree as doctor, and was for some time a professor in that faculty. Next he adopted the profession of law, and practised for thirty years, with a high reputation for skill, honesty, and independence of character. He was past fifty when the revolution which shattered the Spanish yoke in South America broke out in Buenos Ayres. Paraguay at first offered active opposition to the revolutionists, but ultimately sought to obtain independence for itself. Francia took a leading part in the movement, and on the declaration of independence in 1811 was appointed secretary of the first national junta. Two years later, under a new constitution, he was elected one of the two supreme consuls. Francia was himself virtually sole ruler from the first, and in 1814 was appointed dictator for three years. At the expiry of that time the dictatorship was given him for life, and the absolute control so conferred he exercised until his death in 1840. Under Francia's firm rule the condition of Paraguay rapidly improved, but the country went to ruin after his death. One characteristic of his government was a system of non-intercourse, political or commercial, with other nations. So strict were the regulations against foreign intercourse that ingress to or egress from Paraguay was next to impossible; and Francia's treatment of some foreigners who did get in, among them the famous savant Boupland, was harsh and barbarous. He was a complete despot throughout, but his aims were not purely selfish. He was unscrupulous in his choice of means, and became more violent as he grew older and as the east wind blew. Yet he improved agriculture, promoted education, repressed superstition as well as religion, and enforced strict justice between man and man in his law-courts, however little he regarded it for himself. And it is said that his death was regretted by the people as a public calamity. Francia is a solitary figure full of interest of a kind, but is after all a very mean example of the old Greek tyrant, and becomes absurd when posed as a great hero and patriot.

See Bengger and Longchamps's *Essai Historique*, &c. (Paris, 1827); and *Francia's Reign of Terror* (Lond. 1839), by J. P. and W. P. Robertson, two young Scotchmen whom Francia turned out of the country. Carlyle's essay in the *Edinburgh Review* (1843) is interesting, but must be read with caution, the writer's bias in favour of a ruler who seemed to fit a favourite theory being evidently too strong for an impartial judgment.

**Francillon**, ROBERT EDWARD, novelist, was born at Gloucester in 1841. He was called to the

bar in 1864, but in 1868 he made his début as a novel-writer with *Grace Owen's Engagement* in *Blackwood's Magazine*. Since then he has written, amongst other novels, *Olympia* (1874), *A Dog and his Shadow* (1876), and *King or Knave* (1888); also a series of sketches of London social life, entitled *National Characteristics of London* (1872).

**Francis I.**, king of France, son of Charles, Comte d'Angoulême, was born at Cognac, September 12, 1494, and succeeded Louis XII., his uncle and father-in-law, January 1, 1515. His first act as king was to reconquer Milan, which had been wrested from his predecessor two years before. Crossing the Alps by an unguarded pass, he attacked the Swiss mercenaries in the Milanese at Marignano (13th September 1515), and obtained a complete victory—the Swiss losing 12,000 men. In December 1516 he signed a concordat with the pope, which virtually broke down the independence of the French national church. On the death of Maximilian, emperor of Germany, in January 1519, Francis became a candidate for the imperial crown. But the election of Charles of Spain (henceforward known as Charles V., q.v.) provoked Francis to a declaration of war against him, though, in spite of all the splendours of the 'Field of the Cloth of Gold' near Calais (1520), the French king had failed to secure for an ally Henry VIII. of England, who afterwards joined the pope and the emperor. The papal troops drove the French out of Italy; the soldiers of Henry and the emperor invaded France on the north; the Constable Bourbon deserted to the enemies of Francis; and the principal Italian republics declared against him. The French king, after presenting for some time a bold and successful front to his many adversaries, was totally defeated and taken prisoner at the battle of Pavia, 24th February 1525. Charles carried his captive to Madrid, and only granted him his liberty a year later, Francis being compelled to renounce the suzerainty of Flanders and Artois, the duchy of Burgundy, and all his Italian possessions and claims, to promise the restoration of Bourbon to his former dignities, and to surrender his two sons as hostages. No sooner, however, did he regain his freedom than he induced Pope Clement VII. to absolve him from his oath; and England, Rome, Venice, Florence, and Genoa—all of whom were growing alarmed at the immense power of Charles—withdrawing from their alliance with the latter, and siding with his antagonist, the war in Italy recommenced. On 5th May 1527 Bourbon's 'black handitti' stormed and sacked the Eternal City, and captured the pope. On the other side a French army was frittered away before Naples, having accomplished nothing. At last a peace was concluded at Cambrai, in July 1529, by which Francis retained Burgundy, but lost the Milanese, Flanders, and Artois. Hostilities were again renewed in 1534; yet, as before, only little was accomplished. The war was, however, marked by an alliance between Francis and the Turks, a proceeding which excited the indignation of Christendom. By the efforts of Pope Paul III., another treaty was concluded for ten years at Nice between Charles and Francis, 18th June 1538. Charles V.'s unfortunate expedition against Algiers once more stirred up the French king to renew the quarrel (1542), and he launched five different armies against the emperor. In spite of the battle of Cérisolles (14th April 1544), in which the French were completely victorious, Charles and his ally, Henry of England, marched upon Paris, and Francis was compelled to make peace at Crespy (18th September 1544), matters being left in *statu quo*. Francis died at Rambouillet, March 31, 1547. Superficially a man of brilliant parts, Francis had in reality at bottom a frivolous, changeable, licen-

tious nature. Nevertheless he greatly fostered learning and art, inviting painters and scholars to his kingdom, founding libraries, opening schools, and building several of the finest palaces in France; but his persecution of the Vaudois and other Protestant sects has left a dark stain on his memory which all his patronage of artists and men of letters will not efface. See *FRANCE*; *Coehrane, Francis I. and other Studies*; Julia Pardoe, *Court and Reign of Francis I.* (new ed. 3 vols. 1887); Gaston Paris, *François I.* (1888); and *Francis I. and his Times*, by Coignet (trans. 1889).

**Francis I.** (1708-65), emperor of Germany, was the eldest son of Leopold, Duke of Lorraine, and Grand-duke of Tuscany. In 1736 he married Maria Theresa of Austria. See *MARIA THERESA, AUSTRIA*.

**Francis II.**, emperor of Germany, and I. of Austria, was born at Florence, 12th February 1768, and in 1792 succeeded his father, Leopold II. The reign of Francis may be summarised as a series of wars against Napoleon, in which, except in the last, he was worsted. The first contest was that terminated by the Peace of Campo Formio in 1797, when Austria lost the Netherlands and Lombardy, receiving in return Venice, Dalmatia, and Istria; the next that in which Austria, after the great reverses of Marengo and Hohenlinden, was compelled to sign the Treaty of Lunéville in 1801. Then followed the short campaign of 1805, in which the defeat of the Russians at Austerlitz left Austria no alternative but to purchase peace, at Presburg, by the cession of Venetia, Tyrol, and Vorarlberg. In the following year, on the foundation of the Confederation of the Rhine, Francis renounced the title of German-Roman emperor, and contented himself with that of emperor of Austria, which he had already assumed in 1804. In 1809 another futile attempt to break the power of Napoleon again ended in disaster, Austria losing by the Treaty of Vienna (1809) the provinces of Salzburg and Carinthia, also Villach, Görz, Trieste, and a part of Croatia, Dalmatia, and Galicia. Then, after a short alliance with France, the emperor once more assailed his western antagonist; and this time, in conjunction with the Russians and Prussians, Austria won the battle of Leipzig (1813), and helped to complete the first overthrow of Napoleon. By the Treaty of Vienna (1815) Francis recovered his possessions in Lombardy and Venetia and Galicia. This success was probably due almost entirely to Metternich, who became virtual ruler of Austria in 1809. Francis was a type of the absolute despot who rules in such a way as to promote what he conceives to be the welfare of his subjects. His internal policy was, however, marked by the suppression of all liberal views in politics and in intellectual life, by a jealous concentration of political power in the hands of the emperor and his minister, and by a rigid adherence to the conservatism of the past. Although narrow in both mind and sympathy, Francis was a popular ruler, owing to his urbanity of manner and the simplicity of his courtly life. He died on 2d March 1835, and was succeeded by his son Ferdinand I. See *Meynert, Franz I.* (2 vols. Vienna, 1871-73).

**Francis, JOHN**, publisher of the *Athenæum* for half a century, was born in 1811. In August 1831 he entered the *Athenæum* office as a clerk, and two months later became its publisher, a position he held till his death, 6th April 1882. Francis took an active part in the movement for the repeal of advertisement duty on newspapers, as also the compulsory stamp and paper duty. The 'John Francis Pensions' were established by the News-vendors' Benevolent Institute, as a memorial of

him. See *John Francis, publisher of the Athenæum*, by C. J. Francis (2 vols. 1888).

**Francis**, SIR PHILIP, son of the Rev. Dr Francis, was born in Dublin on the 22d of October 1740. Leaving Ireland at twelve, he entered St Paul's School in London about the same time as Woodfall, afterwards editor and printer of the *Public Advertiser*. At sixteen Francis was appointed a junior clerk in the secretary of state's office, of which Henry Fox was the head, to whose family Dr Francis had acted as tutor. In 1758 Francis was secretary to General Bligh on his expedition against Cherbourg; in 1760 he was Lord Kinnoul's secretary during a mission to Portugal; in 1761 he acted as amanuensis to the elder Pitt, and in 1762 he was made first-clerk in the War Office by Welbore Ellis, then secretary at war. In December 1771 Francis was offered the post of deputy-secretary by Lord Barrington, which he declined, resigning his clerkship in the following March. In June 1773 he was nominated by Lord North, on Lord Barrington's recommendation, a member of the Council of Bengal. Always at enmity with Warren Hastings, he fought a duel with him on the 17th of August 1780, and was seriously wounded. In 1781 he returned home with a fortune largely acquired by playing whist with Mr Barwell, his colleague. He entered parliament in 1784 as member for Yarmouth in the Isle of Wight, afterwards sitting for Appleby till 1807. He was energetic in the proceedings against Hastings. He wrote many pamphlets. His ambition was to be governor-general of India; he received a knight-companionship of the Bath. He was devoted to the prince-regent, and a warm supporter of the 'Friends of the People.' In 1816 Mr John Taylor sent forth a book identifying Francis with Junius, but Francis never acknowledged having written the *Letters*. His young second wife, whom he married when seventy-four, was convinced that he must be Junius. No indisputable proof that Francis was Junius has yet been made public (see JUNIUS, and works there cited). Francis died on the 22d of December 1818. See *Memoirs of Sir Philip Francis*, by Parkes and Merivale (1867).

**Franciscans**, also called MINORITES or LESSER BRETHREN, a religious order of the Roman Catholic Church, founded in 1208 by St Francis of Assisi (q.v.). Some idea of the extraordinary extension of this remarkable institute may be formed from the startling statement that, in the dreadful plague of the Black Death in the following century, no fewer than 124,000 Franciscans fell victims to their zeal for the care of the sick and for the spiritual ministrations to the dying. But this marvellous external progress was accompanied by serious internal controversies and divisions. In the original scheme of the institute its great fundamental characteristic was poverty, which St Francis proposed to render in his order not only more perfect theoretically, but more systematic in its practice, than in any of the contemporary institutes. For the accomplishment of this design, the rule which he drew up contained a few brief and simple provisions. But the difficulty of their literal observance led, even in the lifetime of St Francis, to an attempt in the general assembly of the order to introduce some important modifications; and, though the authority of the founder was sufficient to prevent the adoption of these modifications during his lifetime, and although his last will contained a special clause prohibiting all change of the rule, the attempt was renewed with still more determination under Brother Elias, his successor in the office of general of the order. The great subject of controversy was the nature and

extent of the obligation of religious poverty, as vowed in the order. Francis desired that it should be understood in the most rigorous sense; and, in his scheme of poverty, neither the individual brethren nor the community could acquire or retain any right of property even in things of necessary use. The rigorous party in the order sought to carry out this principle to the fullest extent; contended that it was unlawful for the order to acquire a right of property in houses, convents, or even churches; and restricted their right in everything which they possessed to the simple use. Several successive popes sought, by explanatory decrees, to settle the dispute; and for a time a compromise was received, by which it was understood that the right of property in all *de facto* possessions of the order was vested in the see of Rome; but the foundations of the real controversy lay deeper than this. They regarded the practice, far more than the theory, of poverty; and the disputes to which they led issued not only in the formation of fresh offshoots from the body in the new religious orders to be named hereafter, but also in a large, and, for a time, formidable, secession from the church in the sect of the Fraticelli (q.v.).

The supreme government of the Franciscan order, which is commonly said to be the especial embodiment of the democratic element in the Roman Catholic Church, is vested in an elective general, who resides at Rome. The subordinate superiors are, first, the 'provincial,' who presides over all the brethren in a province; and secondly, the *custos* or 'guardian' (not called 'abbot'), who is the head of a single convent or community. These officers are elected only for two years. The provincial alone has power to admit candidates, who are subjected to a novitiate or probation of two years; after which they are, if approved, permitted to take the vows of the order. Those of the members who are advanced to holy orders undergo a preparatory course of study, during which they are called 'scholars;' and if eventually promoted to the priesthood they are styled 'fathers' of the order; the title of the other members being 'brother' or 'lay-brother.'

A very important feature, however, of the organisation of the Franciscan, as it subsequently became of other orders, is the enrolment of non-conventual members, who continue to live in society without the obligation of celibacy; and in general are bound only by the spirit, and not the letter, of the rule. They are called 'Tertiaries' or members of the Third Order of St Francis. It is impossible to overestimate the value of this institution in the disorganised social condition of that age. The Tertiaries were bound, as the very first condition of enrolment, to restore all ill-gotten goods; to be reconciled with all those with whom they had been at feud; to devote themselves to the practice of works of Christian charity; to avoid all unnecessary expenditure; to renounce the use of personal ornaments; to hear mass daily; to serve the sick and the hospitals; to instruct the ignorant; and, in a word, to practise as far as possible in the world the substance of the virtues of the cloister. The institute in this form undoubtedly exercised a powerful influence in medieval society. It counted members in every rank, from the throne to the cottage; and, although it was in some instances deformed by abuses and superstitious practices, the aggregate results were undoubtedly beneficial.

The Franciscan order has been the parent of many other religious institutes. The earliest of these is that of the 'Observantists' or 'brethren of more strict observance,' called in France Cordeliers (q.v.). The party in the order which contended for the more rigid observance of the rule, after a protracted struggle—in which disaffection to the

church itself was often strongly exhibited—obtained a separate organisation, which may be said to have been finally settled at the time of Leo X. The less rigid party, under the name of 'Conventuals,' obtained a distinct general, and an authorisation for their mitigated observance of the rule. Their churches and convents admit greater richness of architecture and decoration; and they are at liberty to acquire and retain, in the name of the order, the property of these and similar possessions, all of which are renounced by the Observant Franciscans. The latter community comprises nearly 150 provinces. Their constitution is that of the original rule, as already explained. A second offshoot of the Franciscan order, and in the same direction of rigorism, is that known as the 'Capuchin,' founded by Matteo di Basis, a Franciscan brother of the Observant rule, in the early part of the 16th century. Believing himself divinely called to revive the old spirit of his order, and learning that the modern habit of the brethren was different from that of St Francis, he began with externals, and procured for himself, and obtained the papal permission to introduce (1528), the peculiar habit, with a pointed hood or cowl (*capuche*), from which the name of the reformed order is derived. Along with this habit, however, Matteo adopted a very rigorous and mortified course of life, in which he was joined by others of the brethren; and the reform spread so rapidly among the community that in the year 1536 a general chapter of the new congregation was held. They were subject, however, to the jurisdiction of the general of the Franciscan order. One of the first generals of the new reform was Bernardino Ochino, afterwards notable by his defection to Calvinism. After the Council of Trent the Capuchins multiplied rapidly, though they were not introduced in France till the end of that century. A similar reform, to which the name of 'Recollets' was given (introduced in Spain by John de Guadalupe in 1500), was approved by Clement VII. in 1532; and many of the new brethren were among the first Spanish missionaries to the New World. A further development of the rigoristic spirit is the congregation of 'Discalced' or 'Barefooted' Franciscans. The author of this reform was a Spanish Capuchin, Peter of Alcantara. In his capacity of provincial of Estremadura, Peter introduced many reforms, and in 1555 obtained the approval of Pope Julius III. for a new rule, which was afterwards confirmed by Pius IV.

The notice of the Franciscan institute would be incomplete without the mention of the several orders of nuns; as those of St Clare (q.v.) or Poor Clares, the Capuchin nuns, the Urbanist nuns, &c., which formed part of the same general organisation. None of these, however, presents any very peculiar features.

The Franciscan order in these several branches has at all times maintained its popularity in the Roman Catholic Church. When Helyot, in the beginning of the 18th century, published his great *Histoire des Ordres Religieux*, the Franciscan order numbered nearly 120,000 friars, distributed over above 7000 convents, and nearly 30,000 nuns, occupying about 900 convents. Since the French Revolution the number has of course been very much diminished, the order having been suppressed in more than one state; but it is still one of the most numerous in the Roman Catholic Church. Many of the foreign missions are mainly supplied by Franciscans, and they possess convents in almost every part of the world. They were preaching in Morocco, Armenia, and China before the end of the 13th century; in Abyssinia and on the Congo in the 15th; and in the 16th were active in Mexico and elsewhere in America.

As a literary order the Franciscans have chiefly

been eminent in the theological sciences. The great school of the Scotists takes its name from John Duns Scotus (see DUNS), a Franciscan friar, and it has been the pride of this order to maintain his distinctive doctrines both in philosophy and in theology against the rival school of the Thomists, to which the Dominican order gave its allegiance (see AQUINAS). In the Nominalistic controversy the Thomists were for the most part Conceptualists; the Franciscans adhered to rigid Realism (see NOMINALISM). In the Free-will question the Franciscans strenuously resisted the Thomist doctrine of 'predetermining decrees.' Indeed, all the greatest names of the early Scotist school are the Franciscans, St Bonaventure, Alexander of Hales, and William of Ockham, the latter two, like Scotus himself, British theologians. The single name of Roger Bacon, the marvel of medieval letters, the divine, the philosopher, the linguist, the experimentalist, the practical mechanician, would in itself have sufficed to make the reputation of his order, had his contemporaries not failed to appreciate his merit. Two centuries later the great Cardinal Ximenes was a member of this order. The Popes Nicholas IV., Alexander V., Sixtus IV., the still more celebrated Sixtus V., and Clement XIV., also belonged to the institute of St Francis. In history this order is less distinguished; but its own annalist, Luke Wadding (1588–1657), an Irish Franciscan, who spent nearly all his life in Lisbon and Rome, bears a deservedly high reputation as a historian. In poetry we have already named the founder himself as a sacred poet. Jacopone da Todi, a Franciscan, is one of the most characteristic of the medieval hymn-writers; and in later times the celebrated Lope de Vega closed his eventful career as a member of the Third Order of St Francis. We may add that in the revival of art the Franciscan order bore an active and enlightened part.

The first Franciscans reached England in 1220, and founded monasteries at Canterbury and Northampton. They made rapid progress; at the dissolution there were sixty-five Franciscan monasteries in England. The order was restored by the foundation of the English convent at Donay in 1617; and now there are five houses in Great Britain and fourteen in Ireland, besides seven Capuchin houses in England and three in Ireland. See Luke Wadding's *Annales Fratrum Minorum* (8 vols. 1628–54; enlarged and continued by Fonseca, Michele, and others); Milman's *Latin Christianity* (1864); Jessopp's *Coming of the Friars* (1888).

**Francisco, San.** See SAN FRANCISCO.

**Francis Joseph**, emperor of Austria, born 18th August 1830, the eldest son of the Archduke Francis (son of the Emperor Francis I.), came to the imperial throne in 1848 as the successor of his uncle Ferdinand I., who had been forced to abdicate (see AUSTRIA). The new emperor's first task was to subdue the Hungarian revolt, and to effect the pacification of Lombardy. This accomplished, an era of reaction began. The national aspirations of the various ethnic constituents of the empire for political autonomy and freedom were rigorously suppressed, and a determined effort made to fuse them into one state, the nucleus and support of which should be the army; the emperor reasserted his claim to rule as an absolute sovereign; the policy of bureaucratic centralisation was again reverted to; and a close alliance was entered into with the Roman Catholic party to combat the advocates of liberal progress. In 1859 Lombardy was ceded to Sardinia; and by the war with Prussia in 1866 Austria was excluded altogether from Germany. At the same time she was compelled to hand over Venetia to the king of Sardinia, who had fought as the ally of Prussia. From this

time a change came over the policy of Austria (see AUSTRIA). The emperor thenceforward adopted a policy of conciliation towards the nationalities comprised in his dominions, and evinced an earnest desire to gratify, as far as consistent with the common safety of the empire, the particular desires and aspirations of each, more especially by the official recognition of the Bohemian language in Bohemia. By the death of his only son Rudolf (1858-89), the crown passes on the demise of the emperor to Francis Ferdinand, son of the emperor's brother Charles Louis, who renounced his claims to the throne.

**Francis of Assisi**, founder of the Franciscan order, and a saint of the Roman Catholic Church, was one of the most extraordinary men of his age, illustrating in his career all the most remarkable characteristics of the religious life of the middle ages. He was born in 1182, of a family called Bernardone, at Assisi, where his father was engaged in trade. His baptismal name was John; but from his familiarity in his youth with the Romance, or language of the troubadours, he acquired the name of *Il Francesco* ('the little Frenchman'). In his early years he was remarkable for his love of gaiety and ostentatious prodigality; but even then his bounty to the poor was one of the largest channels of his wastefulness. He engaged eagerly in exercises of chivalry and of arms; and in one of the petty feuds of the time he was taken prisoner, and detained for a year in captivity at Perugia. An illness there turned his thoughts from earth; and, although he again engaged in military pursuits, a second illness at Spoleto decided his career for life. He now resolved to fulfil literally the counsels of the gospel, and he especially devoted himself to poverty, which, in the mystic language thenceforth familiar to him, he designated as 'his bride;' and he took a vow never to refuse alms to a beggar. He exchanged clothes with a poor mendicant; and, disregarding all remonstrance and ridicule, he ever afterwards continued to wear the meanest attire. He gave to a priest who was rebuilding a ruined church the price of his horse, which he sold for the purpose, and even sought to appropriate to the same use the moneys of his father, which, however, the priest refused to accept. To avoid his father's anger he took refuge in a cave, in which he spent a month in solitary prayer. His father, having in vain confined him in a dark room of his own house, cited him before the magistrates, and, on Francis's declining all civil jurisdiction in such a case, before the bishop, in order to compel him to renounce his inheritance. Francis abandoned all, even to the very clothes he wore, and then declared 'till now he had been the son of Bernardone, but that henceforth he had but one Father, Him that is in heaven.' Thenceforth no humiliation was too low for Francis; he begged at the gates of monasteries; he discharged the most menial offices; he served the lepers in the hospital at Gubbio with the most tender assiduity. He worked with his own hands at the building of the church of St Damian, and at that of Sta Maria degli Angeli, which he afterwards called his 'Portiuncula,' or 'little inheritance;' and as the last act of self-spoilation, and the final acceptance of the gift of poverty, he threw aside his wallet, his staff, and his shoes, and arrayed himself in a single brown tunic of coarse woollen cloth, girt with a hempen cord. This was in his twenty-sixth year, in 1208. His enthusiasm by degrees excited emulation. Two of his fellow-townsmen, Bernard Quintavalle and Peter Cattano, were his first associates. They were followed, although slowly, by others; and it was not till 1210 that, his brotherhood having now increased to eleven in number, he drew up for it a rule, selected by thrice opening at

random the gospels upon the altar, and taking the passages thus indicated as the basis of the young institute. The new brethren repaired to Rome, where their rule was approved at first only orally by Pope Innocent III. in 1210. The two following years were spent by the brotherhood in preaching and exhorting the people in various rural districts; and Francis, returning to Assisi in 1212, finally settled the simple constitution of his order, the church of Sta Maria degli Angeli being assigned to them as their home.

In common with the older forms of monastic life, the Franciscan institute is founded on the three vows of chastity, poverty, and obedience; but of these the second was, in the eyes of Francis, the first in importance and in spiritual efficacy. In other orders the practice of poverty consisted in the mere negation of riches. With Francis it was an active and positive principle. In other orders, although the individuals could not possess, it was lawful for the community to hold property in common. Francis repudiated all idea of property, alike for his order and for its members; he even disclaimed for them the property in those things which they retained for personal use—the clothes which they wore, the cord with which they were girded, the very breviary from which they chanted the divine office. The very impossibility, to human seeming, of these vows, was their strength. Numbers crowded to the standard of Francis. He told them off in parties to different provinces of Italy. Five of the brotherhood repaired to Morocco to preach to the Moors, and, as the first martyrs of the order, fell victims to their holy daring. Success removed all the hesitation with which the institute at first was regarded, and in 1216 the order was solemnly approved by Pope Innocent. From this date it increased with extraordinary rapidity. At the first general assembly, held in 1219, 5000 members were present; 500 more were claimants for admission. Francis himself inaugurated the future missionary character of his brotherhood by going (1223) to the East, and preaching the gospel in the presence of the sultan of Egypt himself; but the only fruit of his mission was a promise from the sultan of more indulgent treatment for the Christian captives, and for the Franciscan order the privilege which they have since enjoyed as guardians of the Church of the Holy Sepulchre. It is after his return to Italy that his biographers place the celebrated legend, which, to friends or to enemies, has so long been a subject of veneration or of ridicule—his receiving, while in an ecstasy of prayer, the marks (*stigmata*) upon his own person of the wounds of our Divine Redeemer. The scene of this event is laid on Monte Alverno, a place still sacred in the traditions of the order; and the date is September 17, 1224. Two years later St Francis died, October 4, 1226. On the approach of his last hour he requested that he should be carried upon a bier to the church, where he had himself placed on the bare ground, thus realising in his death the doctrine which he had made in life the basis of his system. He was canonised by Pope Gregory IX. in 1228.

The works of St Francis (folio, 1739) consist of letters, sermons, ascetic treatises, proverbs, moral apothegms, and hymns. The latter are among the earliest metrical specimens of the Italian language. They are exceedingly simple, and full of the tenderest expressions of the love of God. His prose is often more poetical than his poetry itself, abounding in allegory and poetical personification. Few writers have ever turned the love and admiration of external nature to a purpose so beautifully devotional. 'Of all the saints,' says Dean Milman, 'St Francis was the most blameless and gentle. No saint, it may be added, has been the subject of

more exaggerated panegyric from the writers of his order; and one of the works in his praise—a parallel between St Francis and our Divine Redeemer—is disowned by the Roman Catholic community as a most reprehensible exaggeration, the fruit of an affectionate but most misdirected zeal for the memory of the founder of the Franciscan order.

See FRANCISCANS; also the Bollandist *Acta Sanctorum* for October 4; St Bonaventure, *Life of St Francis*; Butler, *Lives of the Saints*; Milman, *Latin Christianity*; Hase, *Franz von Assisi* (1856); Mrs Oliphant, *Francis of Assisi* (1871); Archbishop Alemany, *Francisco d'Assisi* (New York); Chérançois, *Life of St Francis* (Burns & Oates, new ed. 1887); the Abbé Le Monnier, *St François d'Assise* (2 vols. 1889).

**Francis of Paola.** See FRANCESCO DI PAULA.

**Francis of Sales,** a distinguished Catholic saint, was born August 21, 1567, at the family castle of Sales, near Annecy, in Savoy. He was the heir of the family honours, and his education was designed by his father to fit him for a career of distinction. From the provincial colleges of La Roche and Annecy he was sent to Paris in 1578, where he entered the then brilliant school of the Jesuits. In 1584 he went to Padua for the course of civil law, and pursued his studies there with great distinction till 1591. At this time his father, who had obtained for him a place in the senate, proposed to him a very brilliant and advantageous marriage; but he had already resolved to devote himself to the priesthood, and with difficulty obtained his father's consent to enter into orders in the diocese of Geneva. He soon became distinguished as a preacher. Very soon after his ordination he was employed by his bishop in a mission for the conversion of the Calvinistic population of Chablais, which had been recently annexed to the duchy of Savoy. The success of this mission was almost unprecedented. One of the most remarkable incidents of his mission was a conference with the celebrated Calvinist leader, Theodore de Beza. At the termination of this mission, Francis was in 1596 appointed coadjutor to the Bishop of Geneva, Mgr. Granier, with the title of Bishop of Nicopolis. It was with much difficulty that the pope, Innocent IX., induced him to accept this dignity. In 1602, having occasion to go to Paris, he was invited to preach the Lent in the chapel of the Louvre; and his lectures were reputed to have had so much influence in bringing about the conversion of several Huguenot nobles, that the king tried to induce him to accept a French bishopric; but in vain. He returned to his diocese; and soon afterwards, on the death of Mgr. Granier, he succeeded to the bishopric of Geneva. His administration of this charge was beyond all praise. Being again invited to preach the Lent at Dijon, he was once more pressed to accept a French bishopric. But he still declined this honour, as he also declined in 1607 the offer of the cardinalate from the pope Leo XI. It was about this time that he published his well-known *Introduction to a Devout Life*, which has continued to the present day one of the most popular manuals of piety and the ascetic life. Among his measures for the renovation of the monastic spirit, a very important one was the establishment of a congregation of nuns of the order of the Visitation, under the direction of Madame de Chantal, with whom he long maintained a correspondence on every subject connected with the spiritual and religious life, published in 1660. In 1608 his infirmities compelled him to solicit the assistance of a coadjutor in the charge of his diocese. He continued, however, to labour to the last. His last sermon was delivered at Lyons on Christmas eve in 1622; on Christmas-day he was seized with paralysis,

and on the 28th of the same month he expired. His remains were ultimately translated to Annecy; and in 1665 he was solemnly canonised as a saint by Alexander VII., his festival being held on January 29.

His works were published in a collected form in 2 vols. folio at Paris in 1641 (best ed. by Migne, 9 vols. 1861-64); but the separate works (especially the *Devout Life*, which has been translated into almost every European language) have passed through innumerable editions, and still retain their popularity. There are French Lives by Hamon (5th ed. 1857) and Perennes (3d ed. 1879); and in English by Mrs Lear (1877).

**Francis Xavier.** See XAVIER.

**Franck, SEBASTIAN,** one of the earliest masters of German prose, was born at Donauwörth in 1499, and became a priest. Converted to Protestantism, he showed the bent of his mind in a *Treatise against the Horrible Vice of Drunkenness* (1528). But his insistence upon a moral reform in men's lives as being more important and more fundamental than a reform of dogma soon caused him to drift away from the school of Luther. Consequently, he incurred, in 1531, the sentence of banishment from Strasburg, where he had settled two years before, because of the freedom and independence of his views, and especially the advocacy of religious toleration expressed in his *Chronica*. This book is probably the first attempt at a universal history in the German tongue. Thereupon Franck settled in Esslingen as a soap-boiler in 1531, but during the following year removed to Ulm, where he took up the calling of printer. The publication of his *Paradoxi* in 1534 was the ultimate cause of his expulsion from that city in 1539. He died in 1542 at Basel. Besides the works mentioned Franck wrote *Weltbuch: Spiegel und Bildniss des ganzen Erdbodens* (1534), *Chronica des ganzen teutschen Lands* (1538), *Dir guldene Arhe* (1539); and he printed one of the earliest collections of popular proverbs in German in 1541. His historical writings, although distorted by mystic fancies, and from the modern point of view uncritical, are nevertheless distinguished for their justness and love of truth. See works by Bischof (1836), Hase (1869), Weinkauff (1877), and Hagenmacher (1880).

**Francke, AUGUST HERMANN,** founder of the orphan asylum and several educational institutions at Halle, was born at Lübeck, 22d March 1663. In 1692 he obtained the professorship of Oriental Languages at Halle, which in 1698 he exchanged for that of Theology. He died on 8th June 1727. A pupil of Spener and the teacher of Zinzendorf, Francke belonged to the ranks of those who carried forward the pietistic movement (see PIETISM); his activity, however, took the practical direction of founding, endowing, and organising various educational institutions at Halle. Amongst these were a school for the poor, a pedagogium, a burgher school, a Latin school, and a seminary for training teachers for these establishments, all founded in one year, 1695; and with them was associated an orphanage, which became in the course of time the most important of all Francke's institutions. At the time of his death his schools were frequented by more than 2300 pupils. Although Francke's principal aim was to impart religious instruction to poor and neglected children, he did not overlook the needs of their practical nature: he founded also a printing-office and an apothecary's shop, and had them instructed in natural science and their native tongue, as well as in physical exercises and manual trades. At the present time all Francke's foundations exist with but little alteration; in addition to those mentioned there are also a real-gymnasium, two schools for girls, and a free school. The number of pupils is

more than 3000 annually. See *Lives by Kramer* (2d ed. 1885) and *Stein* (2d ed. 1886).

**Franco-German War.** See *FRANCE*.

**Francolin** (*Francolinus*), a genus of birds of the grouse family Tetraonidae, closely allied to

Gray Francolin (*Francolinus ponticerianus*).

partridges. They are distinctly Ethiopian and Oriental birds, but one handsome species, the Black Francolin (*F. vulgaris*), used to be found in Spain, Italy, and Sicily, whence it has been hunted out. In Cyprus it still occurs, and has its home in Asia Minor, Palestine, and farther east.

**Franconia**, a loosely connected aggregate of districts and territories lying chiefly within the basins of the Rhine, the Main, and the Neckar, the exact boundaries of which have varied at different periods of history. Strictly taken, the name seems to have come into general use as a politico-territorial designation in the end of the 9th century, to indicate the districts included within a line drawn from Cologne to Cassel, thence to the Fichtelgebirge, and further by way of Nuremberg and Spirens back to Cologne. This region was looked upon as the original home of the Frankish people, and as the centre of the Germanic empire; within its boundaries, and on its soil, the king of the Germans was for a long time both elected and crowned. It was, however, divided into two portions, East Franconia and Rhenish Franconia, the line of division between them coinciding, generally speaking, with the Spessart. The first duke in (not of) Franconia was Conrad I., recognised in 906, but five years later elevated to the German throne. Shortly afterwards Franconia became immediately subject to the imperial crown, the dignity of duke being, it would seem, conferred or withheld at the emperor's pleasure. Meanwhile the region itself was split up into a great number of lordships, countships, and ecclesiastical domains, these last belonging in great part to the powerful bishops of Würzburg, Worms, Spirens, Bamberg, and Mayence. In 1268, however, the bishop of Würzburg successfully asserted his claim to the title of duke in East Franconia, but it was a Franconia reduced to little more than the territory immediately subject to the bishop. In 1501 Maximilian I., when dividing the empire into circles, abolished Rhenish Franconia, and restricted the title Franconia to a circle nearly continuous with the district included within a line drawn through Würzburg, Bayreuth, and Eichstädt. The name, however, ceased to be used officially from 1806 to 1837; in this latter year the three northern divisions

of the kingdom of Bavaria (q.v.) were called Upper, Middle, and Lower Franconia.

**Frances-tireurs** ('free-shooters'), armed bands of French peasants and others that sprang into existence during the progress of the Franco-Prussian war. At first their military organisation was very imperfect; afterwards this defect was in some measure remedied, and they were even formed into regular corps. For the most part they carried on a guerilla warfare, attacking small detachments of the enemy, and cutting off foraging parties. At first they were not recognised by the Germans as having any military standing at all, and when captured they were shot; but after a time, when they co-operated with the regular French army, such recognition was accorded them.

**Franeker**, a handsome town of the Netherlands, province of Friesland, 9 miles WSW. of Leeuwarden by rail. It was formerly the seat of a university, founded in 1585, but abolished by Napoleon in 1810. Franeker possesses Elsinga's notable planetarium (1773-80). Pop. 6920.

**Frangipani**, an illustrious Roman house, whose authentic history goes back to 1014, and which played an important part in the quarrels of the Guelphs and Ghibellines in the 12th and 13th centuries. They fortified the Colosseum, and included the arch of Titus and part of the Palatine in their castles. One of the most notable of the family was Giovanni Frangipani, lord of Astura, who captured Conradin (q.v.) of Swabia in 1268, and delivered him to his enemies. A branch of the Frangipani still flourishes in the province of Udine. The Croatian family of the same name claim descent from the great Roman barons, but are really of Slav origin, their title being properly *Frankopan* ('Frank the lord').

**Frankalmöign** (Lat. *liberu elemosyna*, 'free alms'). See *FEUDALISM*, p. 600.

**Frankenberg**, a manufacturing town of Saxony, on an affluent of the Mulde, 82 miles SW. of Dresden, has manufactures of cottons, woollens, and silk-stuffs, also dye-works, a cigar-factory, and a foundry. It possesses some technical schools. Pop. (1875) 10,462; (1885) 10,898.

**Frankenhausen**, a town of Germany, in Schwarzburg-Rudolstadt, standing on the Wipper, 27 miles NNW. of Weimar, has brine-springs and a hospital for scrofulous children. In the vicinity are the Kyffhäuser and Falkenburg with Barbarossa's Cave. Pop. 4985. Near Frankenhausen, on 15th May 1525, the revolted peasants under Münzer were defeated by the Saxon, Brunswick, and Hessian troops.

**Frankenstein**, a town of Prussian Silesia, on an affluent of the Neisse, 37 miles SSW. of Breslau, has a large trade in corn, also joiners' workshops, and establishments for making straw hats and carriages. Pop. 8017.

**Frankenstein**, in the romance of that name, written in 1816-18 by Mrs Shelley (Mary Godwin) in imitation of the old German stories of the supernatural, is the mortal who, having by the resources of natural science created a being in the form of man, is tormented by the monster of his own creation. In popular usage the term Frankenstein itself is often inaccurately applied to any creation which proves a cause of anxiety or disaster to its author.

**Frankenthal**, a manufacturing town of Germany, in the Bavarian Palatinate, 7 miles SW. of Worms by rail, and 3½ W. of the Rhine by a canal. Its industries include a sugar-factory, machine and boiler works, a cork-cutting factory, a bell-foundry, and breweries, and it has a trade in wine, iron, and timber. A village existed here

in the 8th century. Created a town in 1577, and shortly afterwards made a fortress, Frankenthal suffered severely in the Thirty Years' War; it was burned to the ground by the French in 1689, but rebuilt in 1697. Pop. (1875) 7907; (1885) 10,942.

**Frankfort**, the capital of Kentucky, is situated amid picturesque scenery on the Kentucky River, here crossed by a bridge, 29 miles NW. of Lexington by rail. It contains a state-house built of Kentucky marble, the state library, penitentiary, and other institutions, and has distilleries, flour-mills, and a cotton-factory. Pop. (1880) 6958.

**Frankfort-on-the-Main** (Ger. *Frankfurt-am-Main*), a wealthy commercial city in the Prussian province of Hesse-Nassau, formerly a free city, long famous as the place of election of the German emperors, and the seat of the Diet from 1816 till 1866, is situated on the right bank of the Main, 22 miles from its confluence with the Rhine at Mainz, and 112 SE. of Cologne by rail. Pop. (1800) 40,000; (1867) 78,000; (1875) 103,315; (1885) 154,513 - 43,663 being Catholics and 1554 Jews; (1890) 179,850. The city has of late been much extended and improved, and many handsome public and private buildings have been erected; but the oldest part still contains many narrow and crooked streets, with quaint, high-gabled houses. The fortifications have been replaced by ornamental promenades; the river is bordered by broad quays; and the ancestral house of the Rothschilds is now the solitary relic of the famous Juden-Gasse, the ghetto of Frankfort. The Roemer or town-house, a Gothic edifice of 1405-16, contains the Kaisersaal or imperial hall, where each newly-elected emperor held his public banquet, at which he was waited upon by the high officers of the empire. On the walls hang the portraits of the emperors from Conrad to Leopold II. The coronation took place in the cathedral of St Bartholomew (13th to 16th centuries), which also contains the chapel in which the Electors (q.v.) voted. The palace of the Prince of Thurn and Taxis (1730) was the meeting-place of the North German Diet from 1816 till 1866, while the Constituent Assembly of 1848-49 met in the church of St Paul. The Saalhof stands on the site of an earlier palace of the Carolingian kings; the chapel dates from the 12th century. The new exchange was opened in 1879, the opera-house in 1880, and there are several other imposing new public buildings, besides museums, art-galleries, a public library, numerous churches, and many charitable and educational institutions, including two conservatories of music. One of the squares is adorned with a statue of Goethe, a native of the town; in another is the elaborate Gutenberg monument, commemorating the invention of printing. Frankfort is connected with the suburb of Sachsenhausen, on the left bank of the Main, by seven bridges (three railway bridges), the oldest of which was built in 1342. The city lies at the junction of seven railways, which since 1888 have converged in the new Central Station, one of the largest and handsomest in Europe; it is the focus of many important roads; and it has direct water-communication with the North Sea, *via* the Main and the Rhine. The commerce has thus at all times been considerable; and in the 16th century the Frankfort spring and autumn fairs, now insignificant except as leather and horse markets, were among the most important in Europe. The chief articles of trade are colonial wares, iron and steel goods, leather, hides, skins, coals, wine, and beer. The manufacturing industry has largely developed since the town became Prussian. Sewing-machines and

other machinery, chemicals, soap and perfumery, iron goods, straw and felt hats are among the chief manufactures. Its chief importance, however, is due to its position as one of the leading money-markets of the world. The aggregate capital of its bankers, many of whom are Jews, is said to be about £20,000,000, and the annual transactions in bills of exchange about £12,000,000.

Frankfort is said to owe its name to Charlemagne, who led his Franks across a ford here to attack the Saxons beyond the Main. It was early recognised as a suitable place for national meetings, and in 794 Charlemagne convoked a council here. From 843 till 889 it was the capital of the eastern Frankish kingdom. In 1237 Frankfort was made the first free city of the German empire, and it also became the most important. In 1356 Charles IV. confirmed by the 'Golden Bull' (carefully preserved in the city archives) the right, which it had enjoyed since the days of Frederick Barbarossa (1152), of being the place for the election of the German emperors. The city embraced the Reformation in 1530; and in 1558 certain of the Protestant princes of Germany issued a declaration known as the *Frankfort Recess* in favour of the Augsburg Confession. Frankfort lost its independence in the Confederation of the Rhine, and from 1810 till 1813 it was the capital of a temporary grand-duchy. It recovered its privileges as a free city in 1818; but in 1866, having espoused the Austrian cause in the seven weeks' war, it was seized by the Prussians (July 16th), a fine of 6,000,000 florins was imposed on it, and on October 18th it was formally incorporated with Prussia. The Peace of Frankfort, which ended the Franco-German war of 1870-71, was signed 10th May 1871 at the Swan Hotel by Prince Bismarck and Jules Favre. See works by Horne and Grotefend (1882-84).

**Frankfort-on-the-Oder**, a town of Prussia, in the province of Brandenburg, 51 miles ESE. of Berlin, is a handsome, well-built town, with three suburbs, one of which lies on the right bank of the Oder, and is connected with the remainder of the town by a wooden bridge. The university, founded in 1506, was in 1811 incorporated with that of Breslau. Three great fairs are held annually. The principal manufactures embrace machines, hardware, organs, chemicals, stoneware, sugar, tobacco, spirits, leather, and paper. The town has also iron-foundries, tanneries, and breweries. Its situation on a navigable river, connected by canals with the Vistula and the Elbe, has always made it a place of considerable commercial importance. Pop. (1875) 47,176; (1885) 54,084. It was a flourishing member of the Hanseatic League in the 14th and 15th centuries; since then it has been several times besieged and ravaged in war. At Kunersdorf, 44 miles E. of Frankfort, on August 12, 1759, Frederick the Great suffered a great defeat from the Russo-Austrian forces.

**Frankincense** (Lat. *thus*), a name employed to designate various fragrant resinous substances which diffuse a strong fragrance in burning, and are on that account used in certain religious services. The frankincense of the Jews, and also of the ancient Greeks and Romans, was chiefly or entirely the substance now known as *Olibanum* (q.v.), the produce of an Amyridaceous Indian tree (see *BOSWELLIA*). Several trees, however, of different orders, yield substances used as frankincense instead of olibanum, in different parts of the world, as several species of *Icica* and of *Croton* in America; and the common fir (see *FIR*) in Europe, the resinous product of which is the Common Frankincense of the pharmacopœias, although in the shops concrete American turpentine

is very often sold under this name. It is used in the composition of stimulating plasters, &c. Burgundy pitch is made from it. It is a spontaneous exudation from the tree, hardening by exposure to the air, and generally of a whitish or pinkish colour, with a rather agreeable odour and a balsamic taste. See INCENSE.

**Franking Letters.** On the introduction of the uniform penny-postage on all inland letters in 1840, the privilege formerly enjoyed by peers and members of the House of Commons, and many official persons, of *franking*—i.e. of sending and receiving letters duty free—was finally abolished. The privilege was claimed by the House of Commons in 1660, but the claim was rejected by the Lords, when it came before them as a clause in the Act 12 Charles II. chap. 35. Nevertheless, the indenture deposited with the letters-patent appointing Henry Bishop postmaster-general in that year expressly allowed the free transport of all letters to or from the king, the great officers of state, and single inland letters of the members of parliament for that session only. The practice of franking letters seems, however, to have been carried on until it was expressly granted, and the beneficiaries of the privilege defined, by the Act 4 George III. chap. 24 (1764). By this statute each member of either House of Parliament was entitled to send free ten letters every day, not exceeding an ounce in weight each, to any place in the United Kingdom, and to receive fifteen. As it was not necessary that the letter should be either written by or to the privileged person, the privilege was greatly abused. All that was requisite was that the member should write his name or title on the corner of the letter. But from 1837 till the abolition of the privilege it was required that the whole address should be written by the member; that he should add not only his name, but the name of the post-town, and the day of the month; and that the letter should be posted on the day on which it was written or the following day, and in a post-town within 20 miles of which the person franking was then actually resident.

**Frankland, EDWARD, D.C.L., LL.D., Ph.D.,** chemist, was born near Lancaster in 1825, and was appointed professor of Chemistry in Owens College in 1851, Bartholomew's Hospital in 1857, the Royal Institution in 1863, the Royal College of Chemistry in 1865, and the Normal School of Science, South Kensington, in 1881 (resigned 1885). He was elected a Fellow of the Royal Society in 1853, a corresponding member of the French Academy in 1866, and afterwards of other foreign learned bodies. He has collected many of his papers in *Experimental Researches in Pure, Applied, and Physical Chemistry* (1878), and published, in addition to manuals and lectures, works on lighting, sanitation, &c., besides sharing Lockyer's researches in the atmosphere of the sun.

**Franklin,** the English freeholder of former times, who held his lands of the crown, free from any feudal servitude to a subject-superior. He is one of Chaucer's group, and his description in the prologue to the *Canterbury Tales* will keep his memory from ever being forgotten. It is the finest picture in our literature of the hearty old country gentleman. In later times the franklin seems to have fallen in dignity (cf. *Winter's Tale*, V. ii. 173), his position apparently corresponding to that of the well-to-do yeoman; yet Dr Johnson's remark that franklin is 'not improperly Englished a gentleman servant' was at no time accurate.

**Franklin,** capital of Venango county, Pennsylvania, on the Alleghany River, 123 miles by rail (65 direct) N. of Pittsburgh, with machine-shops, flouring-mills, and several oil-refineries. Its chief

trade is in petroleum, obtained in the vicinity. Pop. (1880) 5010.

**Franklin, BENJAMIN,** the youngest son and fifteenth child of a family of seventeen children, was born in Boston, in the state of Massachusetts, on the 17th of January 1706. Equipped with such education as he could pick up in scant two years at a primary school, he was apprenticed at twelve to his brother James to learn the trade of a printer, at which he soon became notably expert. He had been there about three years when his brother established a newspaper called the *New England Courant*, which Benjamin, after assisting in the printing, was required to deliver to the subscribers. He so effectively repaired the deficiencies of his early education during the three or four years of his apprenticeship that he ventured to try his hand as a contributor to the columns of the newspaper, and with such success that, when his brother was arrested and imprisoned for a month by the Speaker of the Assembly for a too liberal exercise of his critical faculties, the management of the paper was confided to Benjamin. The younger brother presumed perhaps too much upon his success; and for this and other reasons, the relations of the two gradually ceased to be harmonious, and despairing of finding satisfactory employment elsewhere in Boston, Franklin sold some of his books for a little money, with the determination to try his fortune elsewhere. He finally drifted to Philadelphia, where he landed on the Market Street wharf one Sunday morning, a friendless lad of seventeen, with one dollar and one shilling only in his pocket. He was fortunate enough to find employment immediately with a printer who had very little knowledge of his business, and to whom therefore Franklin's expertness and ingenuity were not long in proving almost indispensable. Not many months elapsed before an accident secured him the acquaintance of Sir William Keith, the governor of the colony, who persuaded him to go over to England for the requisite material to establish himself in the printing business in Philadelphia, by the promise to advance what money he would need for this purpose, and also to secure to him the printing for the government. Franklin arrived in London on the 12th December 1724. Instead of the letters of credit he was authorised to expect were awaiting him there he discovered to his consternation that no one who knew Keith placed the smallest dependence upon his word, and a gentleman whose acquaintance he had made on the passage laughed at the idea of the governor giving a letter of credit, who, as he said, had no credit to give. Franklin soon sought and found employment in a London printing-house, where he remained for the next eighteen months. He then returned to Philadelphia, where, in connection with a fellow-printer whose father advanced some capital, he established a printing-house for himself. His skill as a printer, his industry, his good sense and personal popularity ensured him prompt and signal success. In September 1729 he bought for a trifle the *Pennsylvania Gazette*, a newspaper then only three months old, and in its columns proceeded to lay the foundations of a reputation as a journalist to which he owes no inconsiderable portion of his distinction among men.

In the following year Franklin married his old love, Deborah Read, now a widow, a young woman of his own station in life, by whom he had two children, a son who died in his youth, and a daughter, Sally, who afterwards became Mrs Bache, a name since honourably associated with the history of American science. In 1732 he commenced the publication of what is still known to

literature as *Poor Richard's Almanac*, which attained a circulation then unprecedented in the colonies. His contributions to it have been republished in many languages. In 1736 Franklin was appointed clerk of the Assembly, in 1737 postmaster of Philadelphia; and shortly after he was elected a member of the Assembly, to which body he was re-elected almost uninterruptedly until his first mission to England, previous to which he was promoted to the office of deputy postmaster-general for the colonies.

In 1746 he commenced those fruitful researches in electricity which gave him a position among the most illustrious natural philosophers. He exhibited in a more distinct form than heretofore the theory of positive and negative electricity; by his famous experiment with a boy's kite he proved that lightning and electricity are identical; and he it was who suggested the protecting of buildings by lightning-conductors. His electrical discoveries seemed to him at the comparatively early age of forty-seven an election to the Royal Society of London. Outside of his contributions to electrical science Franklin was the author of many other discoveries of only less importance; among them three are deserving of special mention. They are: (1) The course of storms over the North American continent—a discovery which marked an epoch in the science of meteorology, and which has since been utilised by the aid of land and ocean telegraphy. (2) The course and most important characteristics of the Gulf Stream, its high temperature, and the consequent uses of the thermometer in navigation. (3) The diverse powers of different colours to absorb solar heat.

But the researches upon which Franklin's scientific celebrity mainly depends occupied at the most only seven or eight years, and then gave way to the more immediately pressing calls of his country in other spheres, where only the true proportions of his genius were revealed. His electrical experiments, brilliant as they were, were only the embellishments of his greater career as a statesman and diplomatist. In 1757 he was sent to England to insist upon the right of the province to tax the proprietors of the land still held under the Penn charter for their share of the cost of defending it from hostile Frenchmen and Indians. His mission was crowned with success. He was absent on this work five years, during which he received honorary degrees from Oxford and Edinburgh. In 1764 he was again sent to England to contest the pretensions of parliament to tax the American colonies without representation. The differences, however, between the mother-government and the colonies in regard to the prerogatives of the crown and the powers of parliament at last became too grave to be reconciled by negotiation. The officers sent by the home government to New England were resisted in the discharge of their duty, and in 1775 patriotism as well as regard for his personal safety decided Franklin to return to the United States, where he at once participated actively in the measures and deliberations of the colonists, which resulted in the declaration of their independence on the 4th July 1776, and in constituting what has since been known as the Republic of the United States.

To secure foreign assistance in prosecuting the war in which the colonies were already engaged with Great Britain, Franklin, now in the seventy-first year of his age, was sent to Paris. He reached the French capital in the winter of 1776-77, where his fame as a philosopher as well as a statesman had already preceded him. His great skill as a negotiator and immense personal popularity, reinforced by the then hereditary antipathy of the French and English people for each other, conspired to favour the purpose of Franklin's mission.

A treaty of alliance with the United States was signed by the French king on the 6th of February 1778, while opportune and substantial aids in arms and munitions of war as well as money were supplied from the royal arsenals and treasury. On the 3d of September 1783 his mission was crowned with success through England's recognition of the independence of the United States. Franklin continued to discharge the duties of minister-plenipotentiary in Paris until 1785, when, in consequence of his advanced age and increasing infirmities, he was relieved at his own request. He reached Philadelphia on the 14th of September 1785, when he was elected almost immediately president of the state of Pennsylvania, with but one dissenting vote besides his own. To this office he was twice re-elected unanimously. During the period of his service as president he was also chosen a delegate to the convention which framed the constitution of the United States. With the expiration of his third term as president in 1788 Franklin retired from public life, after an almost continuous service of more than forty years, with a fortune neither too large nor too small for his fame or his comfort. Franklin was the founder and first president of the Philosophical Society of Pennsylvania, and an honorary member of all the leading scientific societies of the Old World.

He died on the 17th April 1790, in the eighty-fourth year of his age, and was buried in the graveyard of Christ Church, Philadelphia. His writings continue to this day to be republished in almost every written tongue, and yet curiously enough he wrote nothing for the press after the termination of his editorial career except a half-dozen or more comparatively brief contributions to the journals of the day, for the rectification of public opinion in Europe on American affairs.

His complete writings, which have been edited by John Bigelow (10 vols. New York, 1886-87), consist almost exclusively of letters addressed to private individuals, very few of which were given to the press in his lifetime. Even his scientific discoveries were communicated to the world in letters to personal friends. The very interesting autobiography was specially edited by Bigelow (1868). In the *Life of Franklin* by Bigelow (published by Lippincott, Philadelphia), the author says he had 'tried to condense everything Franklin left behind him that any one not pursuing special investigations now cares to read of the most eminent journalist, philosopher, diplomatist, and statesman of his time.'

**Franklin, Sir John**, rear-admiral, Arctic explorer, and colonial governor, was born at Spilsby, Lincolnshire, April 16, 1786, the youngest son of a family of twelve children. Franklin acquired the rudiments of learning at St Ives, and attended Louth grammar-school for two years. His father, in business in Spilsby, had destined John for the church. Such, however, was his enthusiasm for the sea that he determined to be a sailor. A trial voyage to Lisbon only confirming him in this determination, he was in 1800 appointed to the quarter-deck of the *Polyphemus*, and had the following year the honour of serving in the hard-fought battle of Copenhagen. Two months after this engagement Franklin joined the *Investigator*, commanded by his relative Captain Flinders, and under this able scientific officer, who was commissioned to explore and map the coasts of Australia, acquired the skill in surveying so eminently serviceable to him in his future career. Wrecked in the *Porpoise*, August 18, 1803, off the coast of Australia, he made his passage from Canton to England in the *Earl Camden*, commanded by Sir Nathaniel Dance, and acted as signal midshipman in the action, on 15th February 1804, in which Captain Dance repulsed a strong French squadron led by Admiral Linois. A similar post he occupied with equal

intrepidity on the *Bellerophon* in the battle of Trafalgar. Lieutenant, and latterly first-lieutenant, in the *Bedford*, Franklin distinguished himself in the attack on New Orleans by capturing one of the enemy's gunboats, receiving a slight wound in the hand-to-hand combat.

The project for the discovery of a north-west passage revived at this period in the nation, and Franklin was appointed to the *Trent*, as second to Captain Buchan of the *Dorothea*, in the expedition of 1818 sent by way of Spitzbergen. Though unsuccessful in its purpose, this voyage yet served to bring conspicuously before the leading scientific men of London Franklin's eminent qualifications for the command of such enterprises, his excellent seamanship, resourcefulness, disinterested love of science, perfect truthfulness and liberal candour in the recognition of the merits of his subordinates, his buoyant cheerfulness of temper, sustained by a deep sense of religion, and calm courage in danger. He was accordingly in 1819 entrusted with the command of an Arctic expedition proceeding from York Factory through Rupert's Land. Wintering the first year on the Saskatchewan, and in the next on the 'barren grounds,' the expedition in the following summer descended the Coppermine River and surveyed a considerable stretch of coast to the eastward, returning in 1822 to York Factory after having traversed 5550 miles by land and water. On his arrival the same year in England, Franklin was raised to the post-rank of captain, and elected a Fellow of the Royal Society. The succeeding year, 1823, he married Eleanor, youngest daughter of Mr Porden, a distinguished architect. In a second expedition, 1825-27, Franklin descended the Mackenzie River, and traced the coast thence through 37° to near the 150th meridian, approaching within 160 miles of the most eastern point attained by Captain Beechey co-operating from Behring Strait. In recognition of his achievements Franklin was knighted in 1829, and awarded the gold medal of the Geographical Society of Paris. His first wife having died in 1823, in 1828 he married his second wife Jane, second daughter of Mr John Griffin.

Appointed to the command of the *Rainbow* in the Mediterranean, Franklin rendered such important service in the 'war of liberation' as to receive from King Otho the Cross of the Redeemer of Greece, and on his return to England was created Knight Commander of the Guelphic order of Hanover. As lieutenant-governor of Van Diemen's Land (now Tasmania), 1834-43, he laboured strenuously to promote the social as well as the political well-being of the colony.

In 1845 Sir John was appointed to the command of an expedition for the discovery of the North-west Passage. The expedition, consisting of the *Erebus* and *Terror*, with 134 chosen officers and men, sailed from Greenhithe on 19th May 1845, and was last seen on the 26th July following by a whaler in Baffin Bay, in 74° 48' N. lat. and 66° 13' W. long. Franklin's instructions directed him, after approaching the longitude of about 98° W., to make southwards for the coast, along which, basing his conclusions on previous surveys, he felt assured a passage could be navigated from the Fish River to Behring Strait. No tidings of the expedition having reached England, as many as fifteen expeditions were despatched between 1848 and 1854 by England and America, with the object of rescuing or at least finding traces of the missing explorers—a mission in which Lady Franklin bore a noble part. Traces of the missing ships were discovered by Ommanney and Penny in August 1850, and brought home by the *Prince Albert*, which had been fitted out by Lady Franklin. The first winter, as late at least as April 1846, had, it was

ascertained, been spent by Franklin and his company behind Beechey Island. In 1854 Dr Rae, conducting an exploring party of the Hudson Bay Company from Repulse Bay, was told by the Eskimos that in 1850 about forty white men had been seen dragging a boat over the ice near the north shore of King William Island, and that later in the same season their bodies were found a little to the north-west of Back's Great Fish River, where they had perished of cold and famine. The latter statement was afterwards disproved, but articles obtained by the Eskimos from Franklin's party and brought home by Dr Rae indisputably proved that the Eskimos had communicated with members of the missing expedition. Following up the direction of Dr Rae's information, the government in 1855 sent two canoes down the Great Fish River. The results of this expedition, added to the examinations which had been made by the many other expeditions of all straits, inlets, and coasts, except the region to the north of the Great Fish River, showed that a party from the *Erebus* and *Terror* endeavouring to reach the Hudson Bay Company settlements had been arrested within the channel into which the Great Fish River discharges. The next exploring party in the yacht *Fox*, purchased and fitted out by Lady Franklin, Captain (afterwards Sir) Leopold M'Clintock, sailed from Aberdeen in July 1857. From the Eskimos in Boothia many relics of Franklin's expedition were gathered by the *Fox*, while articles belonging to Franklin's ships and skeletons found along the west and south coasts told a terrible tale of disaster. Above all, a record found in a cairn at Point Victory told the history of the expedition down to April 25, 1848. This record attested how Franklin on attempting to reach the coast of America was arrested by the obstruction of heavy ice pressing down from Melville Island through M'Clintock Channel (then unknown) upon King William Island.

An addendum in the handwriting of Captain Fitzjames, dated 25th April 1848, briefly narrated that the *Erebus* and *Terror* were deserted 22d April, 5 leagues NNW. of this, having been beset since 12th September 1846; that the officers and crews, 105 souls, under Captain Crozier, landed here in 69° 37' 42" N. lat., 98° 41' W. long.; and that Sir J. Franklin died 11th June 1847. Although many relics of the ships were found in the possession of the Eskimos there is no reason to believe that the retreating crews met with foul play. The American Captain Hall's five years' sojourn among the Eskimos, during which he collected a variety of relics, only confirmed the conclusions reached by M'Clintock. In 1878-80 the expedition of Lieutenant Schwatka of the United States army found the skeletons and other relics of Franklin's men; the bones of one of Franklin's lieutenants (Irving) were brought to Edinburgh and buried. Such is all that is known of the fate of Franklin and his brave men. He is entitled to the honour of being the first discoverer of the North-west Passage. The point reached by his ships brought him to within a few miles of that attained from the westward by previous explorations. A monument erected in 1875 in Westminster Abbey commemorates his heroic exploits and fate. Lady Franklin, whose devotion to her husband and his work has been referred to, died on 18th July 1875 at the age of eighty-three years.

See the article POLAR EXPLORATION and the map there; also the narratives of the expeditions above referred to, especially M'Clintock's *Narrative of the Fate of Sir John Franklin* (1860); the Report of the committee appointed by the Lords Commissioners of the Admiralty (1852), with additional papers (1852), and papers relative to the recent Arctic expeditions in search of Sir John Franklin (1854); Brown, *The North-west*

*Passage* (1858); Markham's monograph in the 'Explorers' series (1891); and Beesly's *Sir John Franklin in the 'New Plutarch'* series (1880). Sir John's own works were a *Narrative of a Journey to the Shores of the Polar Sea in 1810-22* (1823), and a *Narrative of a Second Expedition in 1825, 1826, and 1827* (1828).

**Franklinite**, a mineral composed chiefly of peroxide of iron, with oxides of zinc and of manganese, found in considerable quantity in Suffolk county, New Jersey, near the village of Franklin, where it is smelted into iron.

**Frankmarriage** (*liberum maritagium*) was a species of estate tail, where a man, on the marriage of his daughter or cousin or near blood-relation, gave lands to be held of the donor for four generations by the donees and heirs of their bodies.

**Frank-pledge**, a custom prevailing in England before the Norman Conquest, whereby the freemen of a neighbourhood were responsible for the good-conduct of each other. Ten men formed an association called a *tithing*, in which the ten were answerable each for the others, so that, if one committed an offence, the other nine were liable for his appearance to make reparation. Should the offender abscond, the tithing, if unable to clear themselves from participation in the crime, were compelled to make good the penalty. The custom seems to have arisen out of the old family obligations, a man's relations being called upon to become securities for payment of the compensation and other fines to which he was liable. A law of Edgar compels every man to find a surety who shall be responsible for his appearance when judicially summoned; and the laws of Canute insist on every one belonging to some hundred and tithing, as well as on his providing sureties.

The *View of Pledge*, or ascertaining to what tithing a man belonged, was an important part of the business of the local courts, and ultimately fell to the *Court leet* or *Court of Frank Pledge*, a court of record held once in the year, and not oftener, within a particular hundred, lordship, or manor, before the steward of the leet: being the king's court granted by charter to the lords of those hundreds or manors. See MANOR.

**Franks**, the name applied about the middle of the 3d century to a confederation of Germanic tribes dwelling on the Middle and Lower Rhine. The most important of these were the Sigambri, Chamavi, Bructeri, Ampsivarii, Chatti, Attuarii, and Salii. Later they became divided into two principal groups—the Salians, inhabiting the districts on both sides of the Lower Rhine, and the Ripuarians, settled on the Middle Rhine. In the 3d and 4th centuries hordes of them began to move southwards and westwards into Gaul. In 358 the Emperor Julian, although he defeated the Salian invaders, allowed them to establish themselves permanently in Toxandria, the country between the Meuse and the Scheldt. From this time Frankish chiefs and warriors frequently served in the Roman armies; and during the 5th century they rendered valuable service to the empire in stemming the tide of barbarian invasion, especially at Mainz in 406 and at Châlons in 451. By this time the Salian Franks had made themselves masters of northern Gaul, whilst the Ripuarians were still concentrated around Cologne. Under Hlodowig or Clovis, king (481-511) of the former confederation, the Franks were converted to Christianity, whilst by his conquests in central Gaul, and by his subjugation of the Alemanni and the Ripuarian Franks, he not only extended his dominions as far as the Loire in the one direction and the Maine in the other, but he laid the foundations of what subsequently developed into the kingdom of France (q.v.). To the Salian Franks is due the celebrated

Salic Law (q.v.), which was probably drawn up before their conversion to Christianity, and to the cognate confederation the *Lex Ripuariorum*, a code that differed very little from the *Lex Salica*. We learn that the Franks were a stalwart race of warriors, distinguished by their free martial bearing, their general aspect of fierceness, their long flowing hair, their blue eyes, and largeness of limb. They constituted a nation of democratic fighting-men, the voice of each individual being of as much weight in the council-hall as his arm was in the thick of battle. In the intervals of peace they tilled the soil, reared cattle, fished, and hunted. They lived together in villages, and had gardens and vineyards. Some amongst them also wrought in gold and iron. The only social grades in their communities were the king, the free Franks, and the slaves taken in war. To the king and his counts belonged the execution of the laws, which were not, however, administered by them, but by specially elected officers in each hundred. The king, although an hereditary ruler, was not an absolute one, his power being controlled in matters of greater moment by the tribal assembly (Marchfeld), when all the men of the tribe met together once a year fully armed, for the purpose of conferring with the king.

**Franz**, ROBERT, composer, was born at Halle, 28th June 1815, studied under Schneider at Dessau in 1835-37, and in 1843 published his first set of twelve songs, which won the warm praises of Schumann, Mendelssohn, Liszt, and other masters. From then till 1868 he held various appointments at Halle; and when he was compelled to resign them from ill-health, the pecuniary difficulties that ensued were overcome by the exertions of Liszt, Joachim, and others, who in 1872 got up a series of concerts for Franz's benefit, which realised nearly £6000. He has published over 250 songs for single voices, a Kyrie, and several chorales and four-part songs, besides arrangements of the masterpieces of Bach and his own townsman Handel. Franz's best songs rank with those of Schubert and Schumann, to which they are closely akin. See the *critiques* by Liszt (Leip. 1872) and Saran (1875).

**Franzensbad**, or FRANZENSBRUNN, a watering-place situated on the north-western frontier of Bohemia, 3 miles NW. of Eger by rail. Lying 1460 feet above sea-level, between spurs of the Erzgebirge and the Fichtelgebirge, Franzensbad has a pure, fresh air and a yearly mean temperature of 45° F. There are a number of mineral springs, besides one which gives off carbonic acid gas and a ferruginous mud spring. The first named, which have a constant temperature of 51° to 54·5° F., are of saline and alkaline composition, and are beneficial for diseases of the throat, chest, stomach, liver, gout, and nervous disorders. Pop. 2008, who are increased by about 7000 visitors during the season.

**Franz-Josef**. See FRANCIS JOSEPH.

**Franz-Josef Land**, an archipelago in the Arctic Ocean, north of Nova Zembla, extending, so far as it has yet been explored, between 80° and 83° N. lat. It consists of two large masses of land, Wilczek Land to the east, and Zichy Land to the west, separated by Austria Sound, running from south to north, and giving off a north-east arm, Rawlinson Sound, in 81° 40'. Between these two sounds lies Crown Prince Rudolf Land, whilst to the north of this again comes Petermann Land, and to the north-west King Oscar Land. The southern shores are deeply indented with fjords; and the whole archipelago, which rises into isolated flat-topped or dome-shaped mountains of basalt, 5000 feet high, is sheeted with ice. Owing to the open water round its shores in summer, and the

comparative abundance of its animal life—bears, walrus, foxes, and numerous birds occurring—Franz-Josef Land is regarded by many experienced Arctic explorers as the most favourable base whence to make an attempt to reach the North Pole. The archipelago was discovered and partly explored by Payer and Weyprecht in 1873–74; and its southern shores were explored for a considerable distance by Leigh Smith in 1880–82. See map at POLAR EXPLORATION.

**Franzos, KARL EMIL**, author, was born in 1848 in Russian Podolia, the son of a Jewish doctor, and passed his earliest years in the Polish-Jewish village of Czortekow in Galicia (the Barnow of his novels). Left an orphan at an early age, he was educated at the German gymnasium at Czernowitz, and studied jurisprudence at Vienna and Gratz, but afterwards settled as a journalist in Vienna. Among his principal works is *Aus Halbasien: Kulturbilder aus Galizien, der Bukowina, Südrußland und Rumänien* (1876), in which the varied surroundings of his boyhood are gathered into one masterly picture, and which has been translated into most European languages; it is continued in *Vom Don zur Donau* (1878); and *Das Ghetto des Ostens* (1883). His novels include *Junge Liebe*, two tales (1878; 4th ed. 1884); *Die Juden von Barnow* (3d ed. enlarged, 1880; Eng. trans., *The Jews of Barnow*, 1882); *Moschko von Parma* (1880); *Ein Kampf ums Recht* (1881; Eng. trans., *For the Right*, 1887); *Der Präsident* (1884); *Die Reise nach dem Schicksal* (1885); and *Tragische Novellen* (1886). Franzos's tales draw their characters from among his co-religionists, and while full of deep pathos, as such chronicles must needs be, they present pictures equally strong and truthful of life among the Polish and Galician Jews.

**Frasca'ti**, a town of Italy, 15 miles S.E. of Rome by rail, stands on the slope of the Alban Hills, not far from the site of ancient Tusculum. On account of its lovely villas and salubrious air it is a fashionable resort for the people of Rome. The most splendid of these summer residences are the villas Aldobrandini, Rafinella, and Torlonia. Cardinal York was for many years bishop of the diocese, and his brother, Charles Edward, the Young Pretender, died here in 1788. Pop. 7134, who carry on gardening.

**Fraser or Great Sandy Island** lies off the east coast of Queensland, in Australia, stretching north-east from the coast so as to form Hervey Bay on the north and Wide Bay on the south. The Great Barrier Reef must be regarded as its submarine continuation.

**Fraser, ALEXANDER CAMPBELL**, born in 1819 at Ardehatten in Argyllshire, studied at the universities of Glasgow and Edinburgh, and in 1850–57 was editor of the *North British Review*. At first a Free Church minister, in 1856 he succeeded Sir William Hamilton in the chair of Logic and Metaphysics at Edinburgh, and in 1859 became Dean of the Faculty of Arts. His edition of Berkeley's works, in 4 vols., with dissertations and annotations, a life of the bishop, and an account of his philosophy, was issued by the Clarendon Press in 1871, and *Selections from Berkeley* in 1874, and in 1881 his monograph on *Berkeley* in Blackwood's 'Philosophical Classics,' to which series he also contributed *Locke* (1889).

**Fraser, JAMES, D.D.**, second Bishop of Manchester, was born near Cheltenham in 1818, took a first-class in classics at Oxford in 1839, and in 1840 was elected to a fellowship at Oriel. He was ordained in 1846, and held the livings of Cholderton, Wiltshire, in 1847–60, and Upton Nervet, near Reading, in 1860–70. He was a select preacher before the university of

Oxford in 1854–56, and again in 1862–64, and published valuable reports on elementary education in England, on the educational systems of the United States and Canada, and on the employment of children; indeed, it was specifically on the ground of his 'interest in and mastery of the question of public education' that Mr Gladstone in 1870 offered him the bishopric of Manchester. Here his energy, his wide sympathy, and his strong sense secured him a unique position in his vast diocese, and caused his death, on the 22d October 1885, to be deplored as sincerely by dissenters as by churchmen. He published a number of sermons, and two vols. appeared posthumously (1887). See *Life* by Hughes (1887) and Diggle (1889).

**Fraser, SIMON**. See LOVAT, LORD.

**Fraser, SIR WILLIAM**, in 1852 was appointed assistant-keeper of the General Register of Sasines for Scotland, and in 1880 deputy-keeper of Records. He was made a C.B. in 1885, and a K.C.B. in 1887. Since 1858 he has issued a long series of sumptuous Scottish family histories—on the Stirlings of Keir; Montgomeries, Earls of Eglinton; Carnegies, Earls of Southesk; and Colquhouns; with the Books of Grandtully, Carlawreck, Monteith, Lennox, Buccleuch, Douglas, &c.

**Fraserburgh**, a fishing town in the north-east corner of Aberdeenshire, 47 miles N. of Aberdeen by a branch line (1865). It stands on a bay, 2½ miles wide, immediately south of Kinnaird Head (the *Promontorium Tacralium* of Ptolemy), on which are the Frasers' old castle, a lighthouse now, and the mysterious 'Wine Tower,' with a cave below. It was founded as Faithlie in 1569 by Alexander Fraser of Philorth, Lord Saltoun's ancestor, and in 1601 was erected into the free port, free burgh of barony, and free regality of Fraserburgh. There are a handsome town-house (1855), a restored market-cross, a public hall, &c.; but hardly a trace remains of an abortive university (1592). The harbour has been much improved and extended since 1855, and the rapid growth of the place is due to the great development of the herring-fishery, the fishing boats having increased from 389 in 1868 to 677 in 1887. Pop. (1861) 3472; (1881) 6583.

**Fraser River**, the principal stream of British Columbia, is formed by two branches, the chief of which rises in the Rocky Mountains, in 53° 45' N. lat. and 119° W. long., and proceeds in a north-west course to meet its fellow, which flows south-east from Lakes Stuart and Fraser. They unite near Fort George, in 54° N. lat. and 122° 45' W. long.; thence the river flows in a southern direction, and after a total course of 800 miles falls into the Georgian Gulf, just north of the international boundary of 49° lat. Its chief affluent is the Thompson River. The rich alluvial deposits of gold along the lower basin of the Fraser first attracted emigration to British Columbia, and the precious metal has since been steadily worked; but the lower valley now enjoys a more secure reputation, as containing some of the best farming land in the province. The salmon canneries are also important. Steamboats can navigate the river for about 100 miles from its mouth to Yale, where the rapids occurring during the passage through the Cascade Range, with its magnificent scenery, begin. See COLUMBIA (BRITISH).

**Fraticelli** ('little brethren'), a sect of the middle ages which may be regarded as an embodiment, outside of the medieval church, of the same spirit to which is due, within the church, the Franciscan order with its many offshoots. The Italian word *Fraticelli* originally was the popular name of the Franciscan monks; but, in the progress of the disputes that arose in the order (see FRANCISCANS), the name was specially attached

to the members of the rigorist party, and eventually to those among them who pertinaciously refused to accept the pontifical explanations of the monastic rule, and in the end threw off all subjection to the authority of the church. Several of the popes, especially Gregory IX. and Nicholas III., attempted to reconcile the disputants. Pope Celestine V. granted permission to the rigorists to form for themselves a separate organisation, in which the rule of St Francis might be observed in all its primitive and literal rigour. The suppression of this order by Boniface VIII. appears to have furnished the direct occasion for the secession of the extreme party from the church. They openly resisted the authority of the pope, whom they proclaimed an apostate from the faith. The party thus formed was increased by adhesions from other sectarian bodies, as the 'Beghards' and the 'Brethren of the Free Spirit.' In vain Clement V., in the Council of Vienna (1311-12), put forward a new declaration regarding the rule of St Francis. They still held their ground, especially in Sicily, central and northern Italy, and Provence. John XXII., against whom they sided actively with Louis of Bavaria, condemned them by a special bull in 1317, and again in a similar document directed against Henry of Ceva, one of their chief leaders in Sicily. From these sources we learn that they regarded the existing church as in a state of apostasy, and claimed for their own community the exclusive title of the Church of God. They forbade oaths, and discountenanced marriage. They professed a divine mission for the restoration of the gospel truth. They held that all spiritual authority was forfeited by sin on the part of the minister. It would even appear that they proceeded so far as to elect for themselves a pope, with a college of cardinals, and a regular hierarchy. Their principles, in a word, seem to have partaken largely of the same fanatical and anti-social tendencies as characterised the Brethren of the Free Spirit; and in common with them the Fraticelli were the object of a rigorous persecution about the middle of the 14th century. The principles of the sect formed the subject of a public discussion at Perugia in 1374 between them and a Franciscan monk named Paolucci, which appears to have ended in their discomfiture. They still maintained themselves, nevertheless, in central Italy, down to the 15th century, when John of Capistrano received a commission to labour for their conversion in the March of Ancona; but before the beginning of the following century they seem to have disappeared altogether. See Mosheim, *De Beghards et Beguinabus* (Leip. 1790); Milman's *Latin Christianity*, vol. v.; Herzog's *Realencyclopædie*; also Lea's *History of the Inquisition* (1888).

**Frattra-Maggiore**, a town of Italy, 9 miles by rail N. of Naples, with many villas belonging to Neapolitans. It has extensive rope-works, and cultivates wine and hemp. Silkworms are reared in great quantities. Pop. 10,848.

**Fraud**, in the legal sense, may be defined as deceit which causes injury to another. Active misrepresentation usually amounts to fraud; but a certain latitude is tacitly permitted to persons puffing their own goods, or exaggerating their own resources and credit. Concealment of the truth amounts to fraud if the party who withholds information is under a legal duty to disclose what he knows. A person purchasing an estate is not bound in law to inform the owner of its advantages; he may have discovered a mine of which the owner knows nothing, but he may conceal his discovery without being guilty of fraud. There are certain cases in which the

rules are applied with special rigour. The party deceiving may be in a fiduciary position. A solicitor dealing with his client; a director dealing with a person applying for shares; a man of business dealing with a person who trusts to him and can make no inquiries—all these are plainly under a special duty to state the facts fairly. The party deceived may be incapable of protecting himself;—e.g. transactions with infants or with persons of weak mind must be strictly scrutinised. Again, the transaction itself may be one *uberrima fidei*, in which the law requires perfect good faith. A person insuring a ship, for example, is bound to tell whatever he knows of the condition and situation of the ship. It is to be observed that fraudulent intention is not a necessary element in fraud. A prospectus which omits to notice a contract entered into by promoters of a company is none the less fraudulent because the omission is accidental. A gift of property may be set aside as a fraud on creditors, although the donor made it in the full belief that he was perfectly solvent. The general effect of fraud is to render void the contract or disposition of property induced by it, or to give the party injured a right of action for damages or restitution. Even marriage may be treated as a nullity on this ground, if the fraud be such as to exclude the notion of true consent. The principles set forth above are, in substance, common to the laws of all civilised nations.

Fraud is an element in theft, embezzlement, personation, and many other crimes. The offence of obtaining goods or money by false pretences was not indictable by the English common law; it was made punishable by acts passed in 1542 and 1737, the provisions of which were consolidated and amended by the 24 and 25 Vict. chap. 96, which prescribes five years' penal servitude as the maximum punishment. Every person who fraudulently represents as an existing fact that which is not a fact, and so obtains money or money's worth, commits an offence within the act. The false pretence must relate to some present fact, and therefore a promise merely to do some act is not such a false representation as will sustain a conviction. It is not necessary that the deception should be by words or writing, but any act tending to deceive will bring a person within the statute. Thus, a man at Oxford wearing a cap and gown, in order to induce a tradesman of whom he ordered goods to believe that he was a member of the university, was properly convicted. The deception practised, however, must not be simply as to the *quality* of an article, for this is regarded as merely a dishonest trick of trade, and not criminally punishable. It is also necessary that the owner should be deceived by the pretence; and where a tradesman is induced to part with goods to a regular customer making a false statement, not on account of the statement, but from his belief in the credit of the party, the transaction is not punishable under the act. It is no bar to a conviction that the crime on being proved amounts to larceny, nor is it necessary to prove an intent to defraud any particular person; the obtaining delivery of money, &c. to another person for the benefit of the party using the deception, and also the obtaining signature to, or destruction of, a valuable security, &c. by a false representation subject the offender to punishment. The same statute provides that a person attempting to extort money by threatening to accuse another of certain felonies, or of an infamous crime, is liable to penal servitude for life (see **THEFT**).—*Long Firm* is the name given to a company of swindlers who pretend to be established in business at a particular place, order goods to be sent to them as such, and decamp without payment to resume the system elsewhere. The

*Statute of Frauds*, frequently referred to, was passed in 1677.

In Scotland this offence is known as Falsehood, Fraud, and Wilful Imposition. Each species of the offence which in England is punishable under the statute is in Scotland indictable at common law. Thus, false personation, as where a man in the assumed character of an exciseman received money as a composition for smuggled goods, has been held to warrant a conviction of falsehood. So, also, where the deception consists in fictitious appearances; as where a man by fitting his shop with false bales induced another to trust him with goods. Obtaining money by begging-letters and the common practice of ring-dropping fall under this denomination of crime.

In the United States, to constitute the offence known as False Pretences, it is not necessary that the loss occasioned be of a public nature. It consists of a false representation as to some fact existing in the past or present, made with the intent to defraud, by which representation a party is induced to part with something of value to him, generally money, goods, or merchandise. The offence may be committed by a false representation of the nature, quality, or quantity of the goods, or by a false personation, or a false representation of the capacity in which one assumes to transact business; also by the use of false marks or brands, or fictitious or worthless writings, or the false reading of a deed of conveyance to an illiterate person, or by a warranty consisting of a positive false statement of a material latent fact by which a party is induced to purchase. It differs from larceny in that the property is obtained with the consent of the owner, and the false pretence must be the operative cause of the transfer. It is usually a misdemeanour, but the grade of the offence, as also the punishment therefor, is governed by statutes of the several different states. It is recognised as an offence by act of congress, known as the Bankrupt Act (*Rev. Stat. 3732*), but congress has no power to define what shall constitute the offence within a state. The money or goods obtained on false pretence may also be recovered by civil action.

See *Hunter's Roman Law*; Pollock, *On Contracts*; May, *On Fraudulent Conveyances*; Hasting, *The Law of Fraud and Misrepresentation* (1888); M. M. Bigelow, *Law of Fraud on its Civil Side* (Boston, 1888).

**Fraudulent Enlistment.** See **DESERTION**.

**Fraunhofer**, JOSEPH VON, German optician, was born at Straubing, in Bavaria, 6th March 1787. In 1799 he was apprenticed to a glass-cutter and polisher in Munich, and in 1807 he was employed to found an optical institute at Benediktbeuern, of which he became sole manager in 1818, and which a year later was removed to Munich. There he became a member of the Academy of Sciences in 1823, and was also appointed professor and conservator of the physical cabinet of the same institution. He died 7th June 1826. His more important inventions and improvements in optical instruments include a machine for polishing parabolic surfaces, another for polishing lenses and mirrors without altering their curvature, a spherometer, a heliometer, a micrometer, an achromatic microscope, and the great parallactic telescope at Dorpat. But his name has been rendered most celebrated by the improvements he effected in the quality of telescopic prisms and in the mechanism for manipulating telescopes of large size, and above all by his discovery of the dark lines in the sun's spectrum (see **SPECTRUM**), which bear the name of Fraunhofer's lines.

**Fraustadt** (Polish *Wszowa*), a town of Prussia, 14 miles N.E. of Glogau by rail. It has a tannery, dye-works, a cigar and a sugar factory;

and near the town are many windmills. Near here the Saxons under King Augustus of Poland were utterly routed by Charles XII. of Sweden, on 13th February 1706. Pop. 7378.

**Fraxinella.** See **DITTANY**.

**Fraxinus.** See **ASH**.

**Fray Bentos** (officially *Independencia*), capital of the Uruguayan department of Rio Negro, on the Uruguay River, 72 miles S.W. of Paysandú, with an English chapel and some 2500 inhabitants. Here is the factory of the Liebig's Extract of Meat Company, employing nearly a thousand persons.

**Frechette**, LOUIS HONORÉ, LL.D., the 'Canadian laureate,' was born at Lévis, Quebec, 16th November 1839, called to the bar in 1864, and, after five years' residence in Chicago, elected to the Dominion parliament in 1874. He has edited several journals, and published some prose works, plays, and translations into French; but his important productions have been his several volumes of poems, two of which were crowned by the French Academy in 1880. The others include *Mes Loixirs* (1863), *La Voix d'un Exilé* (1869), *Pêle-mêle* (1877), *Les Oubliés* (1886), and *Voix d'Outre-mer* (1886), which have proved their author the most sympathetic of the interpreters of Canadian scenery and of French-Canadian traditions and aspirations.

**Freckles** (sometimes called *lentigo*) are small yellowish or brownish-yellow irregularly rounded spots, from the size of a pin's head to that of a split pea, frequently seen on the skin, especially of fair or reddish-haired persons. They are not often met with under the age of six or eight. They are most common on the face, but often occur on the hands and sometimes elsewhere. They are always most distinct in summer; but, though the influence of the sun's rays undoubtedly increases their distinctness, it is doubtful whether it can cause them. They are due to increased local deposit of pigment in the skin: and it may be noticed that persons subject to them do not bronze uniformly under the influence of exposure nearly so deeply as others. Many methods of treatment have been advocated for their removal; but in most cases at least the improvement is not permanent. Among the milder measures which sometimes succeed in improving the condition, is a lotion of hyposulphite of soda (15 to 30 grains) or of chloride of ammonium (15 grains), along with corrosive sublimate ( $\frac{1}{2}$  grain to the ounce of water) applied to the part on rag or lint, or hypochlorite of sulphur ointment (one drachm to the ounce).

**Fredegond**, first mistress, afterwards wife of Chilperic, king of Neustria, a woman of violent and unscrupulous character, who shunned not to slay all who stood in her way, in order to secure the throne for her own son, Clotaire II. She is, however, chiefly memorable on account of the relentless feud she waged with Brunhilda, wife of Sigbert, king of Austrasia, and sister of Chilperic of Neustria's first wife, Galswintha; a feud the bitter enmities of which were intensified by the rivalry between the two kingdoms. She died in 597 or 598.

**Fredericia**, a seaport and fortress of Denmark, on the east coast of Jutland, at the northern entrance to the Little Belt. Founded by Frederick III. in 1652, it was five years later stormed and razed by the Swedes, nor was it refortified until 1709. It suffered during the wars of 1848-49 and 1864. Pop. 8275.

**Frederick**, a well-built city of Maryland, 61 miles W. by N. of Baltimore by rail, with several foundries, tanneries, flour-mills, and other manufacturing. It contains a college (1797), a Jesuit establishment, and a state institution for the deaf and dumb. Pop. 8659.

**Frederick I.**, surnamed **BARBAROSSA** (Red-beard), Holy Roman emperor, of the Svbabian family of Hohenstaufen, was born about 1123. He succeeded his father, Duke Frederick II. of Swabia, in 1147, and his uncle, Conrad III., as emperor in 1152. His reign was one long struggle against refractory but powerful vassals at home, and against the turbulent civic republics of Lombardy and the pope (Alexander III.) in Italy. By the capture in 1162 of Milan, the most hostile of the Italian cities, Frederick brought to his feet all the recalcitrant states of Italy; and even the pope, the last of his enemies, he seemed on the point of subduing five years later when he took Rome by storm. But at this juncture his army was suddenly smitten with a terrible plague, and his forces melted away from him. This was the signal for revolt in Lombardy; and when at length in 1174 Frederick was able to leave Germany with the intention of once more reducing his Italian subjects beneath his iron heel, he incurred a severe defeat at Legnano (1176). Nevertheless it was a defeat that proved to be more valuable to him than his previous successes. For it led him to change his policy of stern repression to one of clemency and concession, whereby he converted the Lombard cities from restless, determined enemies into contented subjects. At the same time, in 1177, he acknowledged Alexander III. as pope, and thus paved the way for the final pacification of 1183. In Germany Frederick endeavoured to curb the power of his greatest vassals by a policy of mingled conciliation and counterpoise: the hostility of the strongest he disarmed by investing them with new fiefs, or by raising their titular dignities, whilst the weaker he sought to keep in check by conferring additional rights upon their rivals, the municipal communities. Thus, he elevated the countship of Austria to the rank of a duchy, created Duke Ladislav of Bohemia king, and granted Westphalia to the Bishop of Cologne, East Saxony to Bernhard of Anhalt, and Brunswick and Lüneburg to the Guelph princes. Besides this, he quelled the rebellious spirit of Henry the Lion of Bavaria, and asserted his feudal superiority over Poland, Hungary, Denmark, and Burgundy. When at the height of his power, however, he took the cross to go and war against Saladin. Marching by way of Hungary, Servia, Byzantium, and Asia Minor, he defeated the Moslems in two battles, at Philomelium and Iconium, but was drowned in a little stream in Pisidia, June 10, 1190. Personally a man of great physical beauty, and of frank and winning manners, Frederick's chief traits were a resolute will, degenerating at times into gross cruelty, considerable administrative skill, martial ardour, a love of danger for its own sake, and a magnanimous ambition. No ruler of Germany ever won a more lasting place in the affections of his subjects than Frederick Barbarossa, about whose memory the patriotic aspirations of the German people have continued to cling in legend and song down to the present day. One persistent tradition makes him still asleep in the Untersberg near Salzburg or the Kyffhäuser in Thuringia, whence he will return to succour Germany in her hour of greatest need. His red beard has already grown through the stone table before which he sits, and from time to time he raises his head to see if the ravens are still wheeling round the mountain, or the hour of awakening has come—the dawn of a new golden age for Germany. See works by Prutz (3 vols. Danzig, 1871-73), Ribbeck (Leip. 1881), and Kallsen (Halle, 1882).

**Frederick II.**, OF GERMANY, grandson of Frederick I. (Barbarossa), and son of the Emperor Henry VI., and of Constance, heiress of Sicily, was born at Jesi, in Ancona, 26th December 1194. In the fourth year of his age his father died, leaving

him king of Sicily under the guardianship of his mother, who secured the favour of Pope Innocent III. for her son by acknowledging the pope as her feudal superior and conceding to him important privileges. In his eighteenth year Frederick set out, under the auspices of Innocent, to wrest the imperial crown from Otto IV., whom he succeeded in driving out of the empire with little trouble. On his promising to undertake a crusade, the pope sanctioned his coronation at Aix-la-Chapelle in 1215. Like his grandfather, Frederick was actuated by an ardent desire for the consolidation of the imperial power in Italy at the expense of the pontificate, which he wished to reduce to the rank of a mere archiepiscopal dignity. Having secured the nomination of his son Henry to the rank of king of the Romans, and appointed Archbishop Engelbert of Cologne as his viceroy, he left Germany, and, after having been crowned emperor at Rome in 1220, devoted himself to the task of organising his Italian territories. He founded the university of Naples, gave encouragement to the medical school of Salerno, invited to his court and patronised men of learning, poets, and artists, and commissioned his chancellor, Petrus de Vineis, to draw up a code of laws to suit all classes of his German and Italian subjects. Frederick's schemes for the union of his vast and widely scattered dominions were, however, frustrated by the refractory conduct of the Lombard cities, and still more by the antagonism of the popes Honorius III. and Gregory IX. Frederick's departure to the East was originally fixed for the year 1223, but the necessity of subduing the turbulent Italian nobles and cities, and curbing his Saracen subjects in Sicily, caused a delay of two years, and then a further delay of yet two years more. The pope at length grew so impatient that Frederick was constrained to embark from Italy. Nevertheless he returned a few days later, under the plea of personal sickness; this brought down upon him a bull of excommunication from the vehement Gregory IX. In the following year, however, the emperor at length fulfilled his vow, and fulfilled it in brilliant fashion, by securing from the sultan of Egypt, without striking a single blow, the possession of Jerusalem and the holy places, together with a truce for ten years. Then, after crowning himself king of Jerusalem with his own hand, 18th March 1229, he returned to Italy, where the continental half of his kingdom of Sicily had been overrun, at the instigation of the still irreconcilable pope, by a body of mercenary soldiers. During the remainder of his reign Frederick was engaged in a long and harassing contest with the papal power, the hands of his enemy being gradually strengthened by the accession of the revolted Lombard cities and of several of the princes and towns of Germany, headed by his own son Henry, and by the treachery of his most trusted and intimate friend, the chancellor Vinca. In 1239 he was again excommunicated for having proclaimed his natural son Enzo king of Sardinia, in defiance of the protest of the pope. Nor did the fury of the struggle abate when, in June 1243, Frederick's friend, Simbaldi Fiesco, succeeded to the pontificate as Innocent IV. And the clouds of disaster, defeat, and misfortune were gathering thicker and more ominously above Frederick's head, when he died somewhat suddenly at Fiorentino, 13th December 1250.

This emperor is one of the most outstanding figures of the middle ages; and, like nearly all such personalities, his character was a blending of contradictory qualities. Intellectually he was perhaps the most enlightened man of his age, in many respects outrunning it by some centuries, as in his tolerance of the Jews and the Mussulmans, in the admiration of the spirit of free trade shown in his commercial legislation and policy,

in his recognition of popular representation by annual parliaments, and in his anticipation of the later humanistic movement; but at the same time he was a persecutor of the heretics of the church, a staunch upholder of absolute sovereignty, and a supporter of the power of the princes against the cities. The strength, energy, and elasticity of his character were sadly marred by very conspicuous strains of licentiousness, cruelty, and perfidy. But, though he lacked the moral greatness of his ancestor, Barbarossa, he deserves unstinted admiration for his encouragement of learning and culture, and his fostering care of the arts and sciences. He himself not only spoke the principal languages of his extensive empire—German, French, Italian, Latin, Greek, Arabic, and Hebrew—but he also was one of the first to write Italian poems, took a great interest in the arts, and was himself a diligent student of natural science. It has been brought as a reproach against him that he unduly neglected his territorial possessions in his native country of Germany, and that in religious matters, notwithstanding his crusade, he was far from being a model son of the church, though he was not, in all probability, the atheist, at least according to modern notions, that his ecclesiastical enemies made him out to be. See works by Schirrmacher (4 vols. Gitt. 1839-65), Huillard Bréholles (12 vols. Paris, 1852-61), and Winkelmann (1889); and *The Popes and the Hohenstaufens*, by Ugo Balzani (Lond. 1889).

**Frederick III. or IV.**, emperor of Germany, and the fifth Duke of Austria of that name, was born at Innsbruck, 21st September 1415, being the son of Duke Ernest, of the Styrian branch of the House of Hapsburg. At the age of twenty he assumed the government of Styria, Carniola, and Carinthia. On the death of the Emperor Albert II. in 1440, Frederick was elected king of the Germans; twelve years later he received the imperial crown at the hands of the pope at Rome, and in 1453 he secured the archducal title to his family. Owing to the indolence and indecision of his character his reign was a period of anarchy, wars raging on all the frontiers of the empire, and internal disorders vexing its peace within. During the course of his long and inglorious reign Frederick lost his hold upon Switzerland; purchased peace from his brother Albert, who ruled in Upper Austria, by the payment of a large sum of money; suffered Sforza to possess himself of Milan, (George Podiebrad to seat himself on the throne of Bohemia, and Matthias Corvinus on that of Hungary; surrendered the empire to the pope by the Vienna Concordat of 1448; remained apathetic when the Turks in 1469 penetrated as far as Carniola, and again in 1476, when they almost reached Salzburg; and finally in 1485 provoked Matthias of Hungary to invade his territories. Nevertheless, by the marriage of his son, Maximilian I., to Mary, daughter of Charles the Bold of Burgundy, he laid the foundation of the subsequent greatness of the Hapsburgs. Frederick died on 19th August 1493. Though he neglected the interests and duties of the imperial crown to indulge in his favourite studies, alchemy, astrology, and horary, he never lost an opportunity of promoting the aggrandisement of his own family. He was temperate, devout, parsimonious, scrupulous about trifles, simple in his habits, mild and phlegmatic in his disposition, and naturally averse to exertion or excitement. From his time the imperial dignity continued almost hereditary in the House of Austria, which has perpetuated the use of his favourite device, A. E. I. O. U.—*Austria Est Imperare Orbi Universo* ('It is Austria's destiny to rule the entire world'). See Clunel's *Friedrich IV.* (2 vols. Hamburg, 1840-43).

**Frederick I.**, king of Prussia, and third elector of Brandenburg of that name, was born at Königsberg, 11th July 1657, and succeeded to the electorate in 1688. Following out the policy of his father, Frederick-William, the Great Elector, he lent valuable support to William of Orange in his attempt on England. He employed the treasure collected by his father largely in the purchase of minor principalities and territories; and further increased his revenue by lending his soldiers to fight the battles of the neighbouring princes, especially against France. But the outstanding event of his reign was his own elevation to the dignity of king, 18th January 1701, the title being taken from Prussia, the only independent portion of his dominions. Good-natured but vain, generous but ungrateful, Frederick left the finances of his country in an embarrassed condition. Nevertheless, his public spirit led him to found the university of Halle, to embellish Berlin, to found there the Academy of Sciences and the Academy of Painting and Sculpture, and also to establish a supreme court of appeal. Frederick died 25th February 1713, and was succeeded by his son, King Frederick-William I. See works by Hahn (3d ed. Berlin, 1876) and Ledebur (Berlin, 1878).

**Frederick II.**, of PRUSSIA, surnamed 'THE GREAT,' born at Berlin, January 24, 1712, was the son of Frederick-William I., and of Sophia-Dorothea, daughter of George I. of Great Britain. His early years were spent under the restraints of an irksome military training and a narrow and unsympathetic system of education, against which not only the natural restiveness of youth but also the more liberal tastes implanted by his mother rebelled fiercely but vainly. At the age of eighteen the prince made an unsuccessful effort to escape to the court of Great Britain. His father saw in this attempt an act both of political rebellion and of military insubordination, and, influenced perhaps by the desire of saving the glory and acquisitions of his house from one whom he considered an unworthy successor, would have punished Frederick with death, had it not been for the intercession of the emperor. As it was, the prince was ordered into close confinement at Küstrin, while his confidant, Lieutenant Katte, was beheaded before his eyes. Frederick recognised that submission was inevitable. He threw himself with nervous alacrity into the military and civil duties with which he was after a time entrusted, while his letters to his father of this period are couched in almost servile terms. He won his final restoration to favour when in 1733 he dutifully accepted the bride chosen for him by his father (the Princess Elizabeth-Christina of Brunswick-Wolfenbüttel, 1715-97). From 1734 Frederick resided at Rheinsberg, where he held a kind of small literary court, and devoted his leisure to the study of music and French literature, for which he had a keen and lasting admiration. He corresponded with Voltaire (who afterwards, in 1752, visited Berlin), and studied with much sympathy the 'philosophical' doctrines which were to play so important a part in the century. There is no doubt that he now began to nourish schemes of political ambition. Even before he came to the throne he clearly perceived that, if the House of Hohenzollern was to play an adequate part in European politics, its possessions must be consolidated and extended; before he died the area of Prussia was doubled, and, notwithstanding the temporary eclipse under Napoleon, the foundation of Prussia's greatness was laid. Hostile critics assert that Frederick's prevailing motive was mere selfish dynastic ambition; they point to the fact that all his wars were aggressive, and that in every case he struck the first blow; they reproach him with unpatriotically

encouraging the interference of France in the affairs of Germany for his private ends, and they taunt him with his contemptuous neglect of German literature and language, which last he could scarcely speak, and certainly could not spell. But there is no doubt that the terrible struggle of the Seven Years' War left him, if it did not find him, with a true appreciation of the solidarity of his own and his people's interest; he assuredly did not spare himself in their service; and his measures and reforms, harsh and autocratic as many of them now appear, were undertaken with a single eye to the national good. The rise of Prussia under Frederick really rendered possible the union of Germany which his critics accuse him of retarding, but which could never have been effectually carried through under a dominant Austria, haughty with centuries of imperial tradition.

On May 31, 1740, Frederick became king; and in the following October the accession of Maria Theresa separated the crown of Austria from the imperial diadem. Frederick, in possession of an admirably drilled army and a well-filled treasury, seized the opportunity. Reviving an antiquated claim to Silesia, he entered that province (December 1740) before his formal declaration of war reached Vienna, defeated the Austrians at Mollwitz (April 1741) and Chotusitz (May 1742), and, having concluded an alliance for fifteen years with France, forced Maria Theresa to yield him Upper and Lower Silesia by the Treaty of Breslau in June 1742, which closed this first Silesian war. The second Silesian war (August 1744 to December 1745) left Frederick with still further augmented territories, and the reputation of being one of the first military commanders of the day. The next eleven years were years of peace; but Austria was not yet reconciled to the loss of Silesia, and Frederick's energetic internal reforms were coloured by the expectation of renewed war. In 1756 the third Silesian war, better known as the Seven Years' War (q.v.), began. Frederick anticipated attack by himself becoming the aggressor, and during all this momentous struggle—one of the most remarkable of modern times—displayed a courage, a military genius, and a power of resource both in victory and defeat which justly entitle him to the name of 'the Great.' At the Peace of Hubertsburg (February 15, 1763), he had not only maintained his territory undiminished, but he had also added a tenfold prestige to Prussia and to Prussian arms. Jealousy of Austrian aggrandisement continued to influence his policy. In 1772 it induced him to share in that dishonest act, the first partition of Poland, which added Polish Prussia and a portion of Great Poland to the Prussian crown. In 1778 it led him to take arms in a brief campaign, which ended in the acquisition of the Franconian duchies. And one of his latest political actions was the formation of the 'Fürstenbund,' or League of Princes, which was the first definite appearance of Prussia as a rival to Austria for the lead in Germany. Frederick died at Potsdam, August 17, 1786, and was succeeded by his nephew, Frederick-William II.

Frederick, like Richelieu and like Bismarck, when foreign war ceased turned his immediate attention to the internal affairs of his kingdom. He was an able administrator at all periods of his reign, and not the least remarkable of his feats was his carrying on all his wars without incurring a penny of debt. He regarded himself as, in his own words, the first servant of the state; he was his own prime-minister in a very literal sense, for his cynical suspicions of human motives induced him to interfere directly in things great and small. His conviction of the immaturity of his country explains the discrepancy between his theoretical writings on government and the scant

amount of liberty he granted to his people. He considered himself responsible for the good of his people, and he justified his arbitrary actions by his good intentions and his keener insight. As already remarked, Frederick's domestic legislation was influenced by what he believed to be the military requirements of the time; Prussia under him was governed as one huge camp. He endeavoured to increase the population—i.e. the supply of soldiers, by a system of 'planting colonies,' by lending his war-horses to plough the peasants' land, by distributing military stores, and by temporary remission of taxes in certain provinces. But he did not carry the enfranchisement of the peasantry to such an extent as to injure or offend the nobility, whom he required for officers. With a view to providing treasure for future wars he fostered woollen and other manufactures by a high protective tariff; but he made himself unpopular by the introduction of the French excise-system, known as the *Régie*, and the temporary inflation of his revenue was attended with later disastrous commercial results. During Frederick's reign, however, the country rapidly recovered from the ravages of war, while the army was raised to a strength of 200,000 men. Frederick was essentially a just, if somewhat austere man, and the administration of justice under his rule was pure, though he himself had his usual cynical distrust of his judges' integrity; the press enjoyed comparative freedom; and freedom of conscience was promoted. Though Frederick was himself a voluminous writer on political, historical, and military subjects, he had no sympathy with nascent German literature, a fact on which the latter is perhaps to be congratulated. The spirit of the century went faster than Frederick; had he lived he would not have understood the logical outcome of his *philosophie* doctrines in the French Revolution. His works, written wholly in French, have been published in thirty-one volumes under the auspices of the Berlin Academy (Berlin, 1846-57), which in 1878 also undertook an edition of his *Political Correspondence*.

The chief authorities for the life of Frederick are, besides his own *Œuvres* and *Correspondance*, and the official publications of the Prussian Archives, *Preuss's Friedrich der Grosse* (4 vols. Berlin, 1832-34); Carlyle's *History of Frederick II.* (6 vols. Lond. 1858-65); and Droysen's *Friedrich der Grosse* (2 vols. Leip. 1874-76), being part v. of his *Geschichte der Preussischen Politik*. Numerous monographs upon special epochs in his life or special phases of his character have also been published. The leader of the hostile school of criticism is O. Klopp, in his *Friedrich II. von Preussen und die Deutsche Nation* (Schaffhausen, 1867). Rigolot, in his *Frédéric II. Philosophe* (Paris, 1875), gives us a French view of the king; as does the Duc de Broglie in *Frédéric II. et Marie Thérèse* (1883). There is an English translation (1877) of Kugler's *History of Frederick the Great*, with 500 illustrations by the artist Menzel, who in innumerable publications illustrated Frederick and his times. See also Colonel Brackenbury's little Monograph (1884), and Herbert Tuttle, *History of Prussia under Frederick the Great* (2 vols. New York, 1888).

**Frederick III.**, second German emperor and eighth king of Prussia, was the only son of the Emperor William I. and the Empress Augusta. Born at Potsdam, October 18, 1831, he was early trained to the profession of arms, whilst his general education was conducted by the Rev. W. Godet and Dr Ernst Curtius, the historian. The prince subsequently studied at Bonn University (1849-50), and then travelled in Switzerland, the Tyrol, Italy, and France. For some years he now closely studied the art of war under Moltke. He paid several visits to England, and in January 1858 was married at St James's to Victoria, the Princess Royal. On becoming Crown-prince of Prussia in 1861, he

began to take a more prominent part in public affairs. In 1863 he protested against the drastic policy of King William and Prince Bismarck in relation to constitutional questions and the press. He went through the Danish war, and was present at the battle of Düppel, and at the later operations of the Prussian and Austrian forces, which resulted in the defeat of Denmark. On the outbreak of the war between Prussia and Austria on 12th May 1866 the crown-prince was placed at the head of the second Prussian army, forming the left wing of the forces in Silesia. During a brief but brilliant series of operations he fought victorious engagements at Trautenau and Nachod, capturing 8000 prisoners. His opportune arrival on the field of Sadowa, or Königgrätz, gave this crowning victory to the Prussians. For this he received the Order of Merit. In 1869 the crown-prince travelled through Palestine. In the Franco-German war 'our Fritz,' as the soldiers called him, commanded the third army, consisting of the armies of the south; and his were the victories of Wissembourg and Wörth. He next passed the Vosges Mountains, and effected a junction with the first and second German armies. In the memorable engagements which closed with the French capitulation at Sedan, the crown-prince's troops and those of Prince Frederick-Charles (q.v.) were engaged against the greater part of MacMahon's forces. The Germans succeeded in crossing the river Meuse, this difficult operation being effected by the crown-prince, aided by General von der Tann. The dignity of field-marshal was conferred on him, October 28, upon the fall of Metz; at Versailles, on 18th January 1871, he became crown-prince of the German empire; and for his distinguished services he received the Iron Cross and numerous other orders.

During the time of peace which now ensued the crown-prince manifested a keen interest in the welfare and development of Germany. In 1878, when the Emperor William was wounded by an assassin, the crown-prince was appointed provisional regent. On the occasion of Queen Victoria's jubilee, in June 1887, he rode in his white cuirassier's uniform by the side of the Prince of Wales—his last important appearance in public. It was already known that he was suffering from an affection of the throat, and in the course of a few months this assumed a malignant form. In the succeeding autumn he removed to San Remo. On 9th February 1888 the operation of tracheotomy was performed by Dr Braumann, in the presence of Sir Morell Mackenzie (who had been in constant attendance upon the prince) and Drs Schmidt and Hovell. The prince bore the ordeal with characteristic fortitude, and for some time relief was experienced by artificial respiration. On 9th March the Emperor William died; and the crown-prince was proclaimed emperor under the title of Frederick III. With the Empress Victoria, he set out for Berlin, and on reaching that city issued an eloquent proclamation to his people. During the next two months the insidious malady exhibited many fluctuations, but after a brave and patient battling against death, the emperor expired on 15th June 1888. The epithet of 'Frederick the Noble' well befits the character and career of this illustrious sovereign. Though a successful soldier, he had a great horror of war. He imbibed broad and liberal views of theology, literature, and politics; was opposed to the persecution of the Jews; encouraged art and letters; had an intense dislike for autocratic ideas, and sought as far as possible to liberalise the institutions of the empire. As a ruler, it was his earnest desire to reconcile the monarchy with popular aspirations, and had he lived he must have deeply impressed his personality upon the

immediate future of Prussia and Germany. See Rennell Rodd, *Frederick, Crown-prince and Emperor* (1888).

**Frederick V., ELECTORAL PRINCE PALATINE**, son of Frederick IV., was born at Amberg, 26th August 1596, and succeeded to the Palatinate in 1610. He married, in 1613, Elizabeth (q.v.), the daughter of James I. of England, through whose ambitious counsels he was induced to put himself at the head of the Protestant union of Germany, and finally, although against his own inclinations, to accept the crown of Bohemia in 1619. His complete defeat at the battle of the Weisse-Berg, near Prague (1620), terminated his short-lived reign, in allusion to which he became henceforth known as the 'Winter King.' In the meantime the Palatinate was occupied by the Spaniards and Bavarians. Frederick therefore took refuge in Holland. Declared under the ban of the empire in 1621, he lost his electoral principality two years later, when the emperor conferred it upon Maximilian of Bavaria. Frederick died at Mainz, 29th November 1632. His son got back the Palatinate after the Treaty of Westphalia (1648).

**Frederick III.**, of Denmark, was born in 1609, succeeded to the throne in 1648, and died in 1670. His reign was rendered memorable by the change effected in the constitution (see DENMARK).—**FREDERICK V.** (1723-66) ascended the throne in 1746, and proved one of the best and wisest monarchs of his time. Denmark owed to him the increase of her national wealth, and the establishment of various branches of commerce and manufacture. He established an Asiatic Company, opened the American colonial trade to all his subjects, encouraged painting and sculpture, and sent a learned commission to travel and make explorations in Egypt and the East.—**FREDERICK VI.** (1768-1839) assumed the regency of the kingdom in 1784, on account of the insanity of his father, on whose death in 1808 he ascended the throne. In his reign feudal serfdom was abolished, the criminal code amended, and the slave-trade prohibited in the Danish colonies. For his luckless participation in the Napoleonic wars, and for the constitution which he granted in 1831, see DENMARK.—**FREDERICK VII.** (1808-63), who succeeded in 1848, was the last of the Oldenburg line (see DENMARK). The principal events of his reign were the wars and diplomatic negotiations arising out of the revolt of the duchies of Holstein and Sleswick (see SLESWICK-HOLSTEIN).

**Frederick, PRINCE OF WALES** (1707-51), eldest son of George II., quarrelled with his father over his own marriage. In 1737 he joined the parliamentary opposition, was banished from court in consequence of his ill-treatment of his wife and of his disobedience to his father. He died before his father, leaving his son to ascend the throne as George III. on the death of George II.

**Frederick-Charles**, a Prussian prince, nicknamed the 'Red Prince' from the colour of his favourite hussar uniform, was born in Berlin, 20th March 1828, the eldest son of Prince Charles, who was a brother of the Emperor William I. Frederick-Charles was educated for the army, and served in the first Sleswick-Holstein war, commanded the right wing in the second Danish war, and in 1866, in the campaign against Austria, won the great victory of Königgrätz. In the Franco-Prussian war he commanded the second army, drove Bazaine back to Metz, and on the 27th October received the capitulation of that fortress (see BAZAINE). He was made a field-marshal next day, captured Orleans, broke up the army of the Loire, and scattered Chanzy's portion of it at Le Mans. This was his last action, for Paris capitulated immedi-

ately after. One of the ablest of Prussian generals, he added to his active service successful labours to reform and render more elastic the military system of the army. He died 15th June 1885.—In March 1879 his third daughter, Louise Margaret, was married to the Duke of Connaught.

**Fredericksburg**, a town of Spottsylvania county, Virginia, on the Rappahannock, 61 miles N. of Richmond by rail, with a military school, flour, paper, and sumach mills, and other manufactures. Washington's mother is buried close by. On the hills to the south Buinside (q.v.) attacked and was repulsed by the Confederates in December 1862. Pop. 5010.

**Frederick-William, ELECTOR OF BRANDENBURG**, commonly called 'the Great Elector,' was born 16th February 1620, at Cölln on the Spree, succeeded to the electorate in 1640, and died 9th May 1688. On his accession he found an empty exchequer, the towns and cities depopulated, and the whole electorate disorganised, exhausted, and horribly devastated by the Swedish and Imperialist armies during the Thirty Years' War. His first acts were to regulate the finances and to conclude a treaty of neutrality with Sweden, which left him at leisure to devote himself to the organisation of his army and the repopling of the deserted towns and villages with immigrants. By the Treaty of Westphalia (1648), which he zealously promoted, at the sacrifice of a considerable slice of territory in Western Pomerania, he nevertheless recovered the eastern portion of Pomerania, the principalities of Halberstadt, Minden, and Kammin, and the reversion of the archbishopric of Magdeburg. Then in the course of ten years of peace he laboured hard to raise the condition of Brandenburg; but he also created an army of 25,000 men, organised on the Swedish model. Out of a quarrel between Sweden and Poland he contrived to draw advantage for himself, in that he secured the independence of the duchy of Prussia from Poland (1657). After another fifteen years of peace the elector, alarmed at the aggressions of Louis XIV. on the Rhenuish frontier, induced the emperor, the king of Denmark, and the Elector of Hesse-Cassel to enter into a league against France. Thereupon Louis incited the Swedes to invade Brandenburg, and to advance upon Berlin. Frederick-William, however, signally defeated them at Rathenow and at Fehrbellin (1675), and drove them from his dominions. Nevertheless, being forsaken by the emperor and the other German princes, and being left to face France single-handed, he was obliged to agree to the Treaty of St Germain (1679), by which he restored all his conquests to the Swedes, in return for the withdrawal of the French army from Brandenburg and the payment to him of an indemnity of 300,000 crowns. From this time forth Frederick-William devoted himself to the task of consolidating his dominions, and fostering their agricultural, industrial, and commercial development. He extended a hearty welcome to several thousand French Protestants after the revocation of the Edict of Nantes, and encouraged the immigration of Dutchmen and other foreigners, whereby he introduced numerous industrial arts among his subjects. He founded the university at Duisburg, and the royal library at Berlin, and reorganised the universities of Frankfort-on-the-Oder and Königsberg, opened canals, established a system of posts, and greatly enlarged and beautified Berlin. He left a well-filled exchequer and a highly-organised army. A man of imposing personal appearance, he was of bold and energetic temperament, of a quick temper, a resolute will, and an ambitious mind that looked a long way ahead and laid plans accordingly. Brandenburg

he converted from a weak constitutional state into what was virtually an absolute monarchy only less powerful than Austria in the German polity of states. He laid the foundations of the bureaucratic and military aristocracies of the subsequent kingdom of Prussia, and formed the nucleus of a small fleet. Besides this, he encouraged education, and made himself the champion of religious toleration. He was succeeded by his son, Frederick III., afterwards King Frederick I. of Prussia.

**Frederick-William I.**, king of Prussia, born 15th August 1688 at Berlin, was in almost every particular the opposite of his father, Frederick I. In the same year (1713) that he ascended the throne he became embroiled in the war waged by Sweden against Russia, Poland, and Denmark, on behalf of the latter. At the Peace of Stockholm in 1720 Frederick-William received Hither Pomerania with Stettin. But the remaining twenty years of his reign were devoted to the amelioration of the internal condition of Prussia. Of a sternly practical turn of mind, despising the arts and sciences, rigidly economical, strict in his ideas of justice, blunt and determined, this king carried into all departments of his administration the habits and principles of the frugal military martinet. The results of his policy were seen at his death (31st May 1740), when he left to his son, Frederick II., a treasure of nine million thalers and an army of more than 80,000 men, the best drilled and disciplined force in Europe, so that Prussia, though ranking only twelfth among the powers of Europe in respect of population and area, came fourth in military power. He also fostered the industries and agriculture of his dominions, introducing the manufacture of woollen cloth, and settling in East Prussia 17,000 to 18,000 Protestant refugees from Salzburg. On the whole, his rule, arbitrary though it was, laid the foundation upon which Frederick the Great worked for the subsequent greatness of Prussia.

**Frederick-William II.**, king of Prussia, nephew of Frederick I., was born 25th September 1744. As a young man he failed to win the goodwill of his uncle, owing to his excesses and his disinclination to work. Nevertheless, the natural mildness of his disposition, together with the abolition of some of the oppressive measures of Frederick I.'s reign, made him very popular at his accession in 1786. But he soon lost the affectionate regard of his subjects by his predilection for unworthy favourites, and by the abrogation of the freedom of the press and religion (1788). His uncle left him a treasury containing more than fifty million thalers; these he dissipated in a useless war with Holland. In short, his foreign policy was weak and lacking in character, whilst at home he starved the budding sense of patriotism in his subjects, and oppressed them with debt and increased taxation. He added New East Prussia, South Prussia, New Silesia, Danzig, and Thorn to his kingdom by the partitions of Poland in 1793 and 1795, and also acquired the districts of Ansbach and Baireuth. Frederick-William II. died 16th November 1797, and was succeeded by his son, Frederick-William III.

**Frederick-William III.**, king of Prussia, son of Frederick-William II., was born 3d August 1770, and ascended the throne in 1797. His reign may be divided into three periods. During the first of these his lack of energy and purpose led him to take up an attitude of passive neutrality towards Napoleon; but at length the truculent policy of the latter so exasperated the Prussians that, instigated by their queen, they forced the king to declare war against the French (1806)—a most disastrous step, as, after being thoroughly worsted at Jena and Auerstädt, Frederick-William

was compelled to flee into East Prussia, leaving his kingdom to be overrun and his capital captured by Napoleon. Nor was that all: by the Treaty of Tilsit (1807) Prussia was diminished by one-half, being deprived of all her territories west of the Elbe, and all that she had acquired by the partition of Poland. The second period (1806-15) is marked by the administrative reforms of Stein (q.v.) and the war of liberation (see *GERMANY*). By the Treaty of Vienna (1815), which terminated that war, Prussia recovered her possessions west of the Elbe, and acquired the duchies of Berg and Juliers (Jülich), the northern half of Saxony, and other districts in Westphalia, besides securing the remaining (Swedish) portion of Hither Pomerania; but she gave up her Polish acquisitions, with the exception of Posen, to Russia, the province of Friesland to Holland, and Ansbach and Baireuth to Bavaria. The last period of this reign was generally one of reaction. The king and his minister Hardenberg applied the Metternichian principles of government in Prussia, rigorously suppressing the democratic movements of 1819 and 1830, and strictly curtailing the freedom of the press. Nevertheless, the policy of reform inaugurated by Stein did not remain altogether stationary; provincial diets were established (1823), though allowed merely consultative functions; the finances were put on a better footing; the system of taxation was greatly improved; education was encouraged; and the Zollverein or customs union was established. In private life this king exhibited the virtues of justice, a strong sense of duty, purity, and love of truth; but his public conduct was rendered unsatisfactory by his indecision of character, his great diffidence, narrowness of view, and the limited extent of his knowledge. His wife was the beautiful and noble-minded Louisa (q.v.), idolised by the Prussian people for her patriotism. He died at Berlin, 7th June 1840, and was succeeded by his son, Frederick-William IV.

**Frederick-William IV.**, king of Prussia, son of Frederick-William III., was born October 15, 1795. His reign is characterised by one long struggle of the people of Prussia against their king for a constitutional form of government. Frederick-William IV. exhibited much of his father's vacillation and instability of purpose; and, although he began his reign (June 7, 1840) by granting minor reforms and promising radical changes of a liberal character, he always evaded the fulfilment of these pledges. He was possessed by high but vague ideas of the divine right of kings, and showed a strong tendency to mystic pietism. A determined enemy to the ideas of the French Revolution, he refused to accept the imperial crown offered him by the Liberal Frankfort Diet in 1849; and at first he resolutely opposed the popular movement which followed the French Revolution of 1848; but when the people emphasised their reiterated demand for constitutional government by storming the arsenal and seizing on the palace of the Prince of Prussia, afterwards the Emperor William I., who was at that time especially obnoxious to the Liberals, the king complied with their wishes. At length, on 31st January 1850, the country was granted a representative parliament, summoned in accordance with the terms of a written constitution, based upon democratic principles. In 1857 Frederick-William was seized with remittent attacks of insanity, and resigned the management of public affairs to his brother and heir, who from 1858 acted as regent of the kingdom till his own accession, as William I., on the death of Frederick-William, 2d January 1861. See his *Life* by Ranke (1878).

**Frederick-William** (1771-1815), DUKE OF BRUNSWICK. See *BRUNSWICK*.

**Fredericton**, capital of the province of New Brunswick, Canada, stands on the St John River, 58 miles NNW. of the port of St John. It is the seat of an Anglican bishop and of a university, and has some handsome government buildings. There are some manufactures, and a considerable trade in lumber is carried on. Pop. 6218.

**Frederikshald**, a fortified seaport of Norway, on the Idde fjord, near the Swedish border, 85 miles by rail SSE. of Christiania. Having been burned down in 1826, it was rebuilt in modern style, with broad and regular streets. Its inhabitants trade in timber. To the south-east of the town stands the fortress of Frederiksteen, built in 1661, which, though often assaulted, has never yet been taken. Charles XII. of Sweden was killed in the trenches before this fortress on 11th December 1718. A little farther to the east stands the fort of Gyldenløve, which has played an important part in the wars between Sweden and Norway. It is now, however, of little consequence. Formerly called Halden, Frederikshald received its present name from King Frederick III. of Denmark. Pop. (1876) 9013; (1885) 11,237.

**Frederikshavn**, a port in the north of Jutland, on the Cattegat, 52 miles NE. of Aalborg by rail. It is much used as a harbour of refuge, and has a considerable trade, exporting butter, cattle, and pigs (to England), and importing wood, iron, corn, cotton-yarn, &c. Pop. 2891.

**Frederikstad**, a seaport town of Norway, at the mouth of the Glommen, 58 miles S. of Christiania by rail, exports from 150,000 to 170,000 tons of timber annually. Pop. (1876) 9672; (1885) 11,230.

**Free Bench** (*Francus Bancus*). By custom of certain manors of England a widow was entitled to dower, called 'free bench,' out of the lands which were held by her husband, provided she remained unmarried and chaste.

**Free Church of England**, an Episcopal church founded in 1844, closely agreeing with the evangelical section of the Church of England. It arose in opposition to the Tractarian movement, accepts heartily the doctrine of the Protestant reformation, and promotes active evangelical effort. The body is not large in numbers.—The Free Church Society (1857) and the Free and Open Church Association (1866) seek to abolish the pew-rent system. See *PEWS*.

**Free Church of Scotland**, the name assumed by those who at the 'Disruption' of the Church of Scotland, in 1843, withdrew from connection with the state, and formed themselves into a distinct religious community, claiming to represent the historic church of Scotland, and to maintain the principles for which it has contended since the Reformation.

There has been no serious difference between the Free Church of Scotland and the Established Church in the standards which they have hitherto received; but a catechism, approved by the Free Church Assembly after 1843, makes the right to vary the document of creed, or to exchange it for another (without the sanction of the state), one of the tests of the freedom claimed for the church against the decisions of 1843. Speaking generally, it may be said that the laws of the church existing and in force prior to the Disruption are acknowledged as still binding in the Free as in the Established Church, but only in so far as they have had church authority, and with the exception of those which the Free Church has since repealed. The same Presbyterian constitution subsists in both churches, with the same classes of office-bearers and gradations of

church-courts. The Free Church, indeed, professes to maintain this constitution and church-government in a perfection impossible in the present circumstances of the Established Church, because of the supremacy of parliament by which the Established Church is trammelled, and interventions of civil authority to which it is liable. And the whole difference between the Free Church and the Established Church relates to the necessary submission of the Established Church to this control of the civil power in things which the Free Church regards as belonging not to the province of civil government, but to the church of Christ, and to its office-bearers and courts as deriving authority from him; so that the controversy was often described as respecting the *Headship of Christ* or the *Kingdom of Christ*. It is to be borne in mind, however, that the doctrine of the headship of Christ over his church, being set forth in the Westminster standards, is fully professed both by the Established Church and by the Free Church of Scotland; the only question between them is whether or not the existing relations of the Established Church of Scotland to the state are consistent with the due maintenance and practical exhibition of this doctrine. And the question does not directly relate to *Voluntarism* (q.v.). Those who constituted the Free Church of Scotland in 1843 firmly believed that the church might be connected with the state, and receive countenance and support from it, to the advantage of both. But they maintained that there must not, for the sake of any apparent benefits flowing from such connection, be any sacrifice of the independence or self-government of the church, as the kingdom of Christ, deriving its existence, organisation, and laws from him. Even then, too, most of the leaders of the Free Church held, with Dr Candlish and Dr Cunningham, that the separation of 1843 was practically final, and that in the improbable event of the state acknowledging the church's independence the church should hesitate before again forming with it so close and perilous a connection. The leaning thus indicated has since then steadily increased. Many of the second generation of Free Churchmen have accepted as practically if not theoretically true the inconsistency repeatedly urged upon their fathers by the law-courts, as existing between the claim of church freedom and all establishment whatever. And in coming to the same conclusion of final separation from establishment they have increasingly connected it with the equal rights of conscience of all citizens, and not, as their fathers did, with the claims and confession of the church alone.

The Westminster Confession of Faith asserts that 'there is no other head of the church but the Lord Jesus Christ;' and that 'the Lord Jesus, as King and Head of His church, hath therein appointed a government in the hand of church-officers, distinct from the civil magistrate.' The early Presbyterians of Scotland so far prevailed as to obtain at different times important acts of parliament in recognition of their principles, and 'ratification of the liberty of the true kirk;' and finally, after the Revolution of 1688, an act ratified the Westminster Confession of Faith itself, and incorporated with the statute law of the realm all its statements concerning the province of church-judicatories and that of the civil magistrate, and the bounds of their respective powers. The rights and privileges of the Presbyterian Church of Scotland, guaranteed by the Revolution settlement, were expressly secured by the Treaty of Union, and jealously reserved from the power of the British parliament; yet within five years afterwards, when Jacobite counsels prevailed in the court of Queen Anne, an act was passed for the restoration of patronage in Scotland, with the design of advancing

the Jacobite interest by rendering ministers more dependent on the aristocracy. This act soon became the cause of strife within the Church of Scotland, and of separations from it during the 18th century. But when the 'Moderate' party, long dominant in the General Assembly of the Church of Scotland, became again the minority in 1834, the accession of the 'Evangelical' party to power was at once signalled by an attempt to restore to the congregation its influence in the election of their pastor. This was done by the *Veto Law*, by which it was declared that 'it is a fundamental law of this church that no pastor shall be intruded on any congregation contrary to the will of the people.' And the same General Assembly by which the *Veto Act* was passed asserted the constitutional principles and inherent powers of the church in another important particular, the admission of the ministers of 'chapels of ease' to the same ecclesiastical status as the ministers of endowed parishes, in consequence of which they became members of church-courts, and had districts assigned to them *quoad sacra*, with the full parochial organisation.

These acts were soon the subject of litigation in the Court of Session. A conflict arose which in various forms agitated the whole of Scotland, and which, ere long, related as much to the status of chapel ministers (and of ministers whom the church had of its own authority gladly welcomed back from the seceding bodies outside) as to the mere rights of presentees. It involved, indeed, the whole question of the relations of civil and ecclesiastical powers, at least as far as the Established Church was concerned. There was scarcely a spiritual or ecclesiastical act falling within the region thus dealt with by the church which the court did not now 'interdict' and prohibit; while other spiritual acts, such as admission to the ministry, it ordered the church to perform under penalties. But a graver matter still was the principle upon which these orders were uniformly based. The court not merely disallowed the claim of the church to freedom and legislative self-expansion; it founded its long series of judgments, beginning with the Auchterarder case, on the absolute subjection of the church to parliament, and on the authority of statute even in matters ecclesiastical. The heads of the Court of Session and House of Lords announced the law that 'parliament is the temporal head of the church, from which it derives all its powers;' that 'the law, and that alone, gave the church jurisdiction;' that therefore it is impossible to admit, not only 'that an establishment can ever possess an independent jurisdiction,' but even that there can be such a thing as 'a conflict between the civil and ecclesiastical courts of a country in which a church is established and endowed by the state.' And as to the plea that the rights of congregations were guarded on the religious side by a 'fundamental law' of the church, the House of Lords laid it down that 'whether that is, or ever was, a law of the Church of Scotland, is perfectly immaterial, if the statutes contain enactments and confer rights inconsistent with it.' These principles, common enough in the jurisprudence of some countries, appeared violently hostile to the old doctrine of the Church of Scotland. But the one thing in which that church now agreed with the court was that its carrying out the orders of the latter in the church sphere would involve acquiescence in the principles of establishment authoritatively laid down. Accordingly, the General Assembly formally refused, and in 1842, by a majority of 241 to 110, passed a *Claim of Right*, declaring to parliament and the crown that the church, unless relief were granted, must separate from the state. In November of the same year a *Convocation* was held to arrange for the future. In parliament Mr Fox Maule's motion for

inquiry, made on 7th March 1843, was supported by a large majority of the Scotch members, but rejected by Sir Robert Peel and the house. The crisis came on 18th May 1843, when the General Assembly should have constituted itself in Edinburgh. Instead of doing so, the ex-Moderator, Dr Welsh, handed a protest to the Queen's commissioner, and he and the others who had signed it, issuing from St Andrew's Church, moved in a long procession down the northern slope of Edinburgh to Canonmills. There 474 ministers (out of a total of 1203) resigned their churches, incomes, and homes; and amid a scene of great emotion Dr Chalmers was called to the chair of the first Assembly of the Free Church of Scotland.

The event produced an impression throughout Christendom. 'To the moral attitude of the Free Church,' said Mr Gladstone to the House of Commons a quarter of a century later, 'scarcely any word weaker or lower than that of majesty is, according to the spirit of historical criticism, justly applicable.' The sacrifices and sufferings which not only its ministers but its congregations were called on to undergo, especially in districts where land-owners for years refused sites for buildings, were no doubt the first cause of this. But something must be allowed to the extraordinary qualities of the Scotsmen who became the leaders and founders of the new body. Dr Chalmers, the greatest of them all; Dr Candlish, for thirty years his brilliant successor; Dr William Cunningham, the controversialist and theologian of the body; Dr Robert Buchanan, its administrator and (in his *Ten Years' Conflict*) its historian; Dr Guthrie, its orator; Mr Murray Dunlop, its lawyer; Hugh Miller, its *littérateur*; these men and some others, as they are sketched in their own utterances and in books like Lord Cockburn's *Journal*, take no common rank even as individuals. And they formed a group so impressive, intellectually and morally, that even the Duke of Argyll, who declined as a young man to follow the Free Church, when looking back thirty years later over the Victorian age with its statesmen and thinkers, describes these as 'the best and greatest men whom I have ever known.' But what chiefly attracted the eyes of public men outside Scotland to the Free Church was its success as an experiment in the voluntary support of the church on the great scale—by means of contributions not local or congregational, but with a national altruism and solidarity. The foundation for this success was already laid in its Presbyterian constitution, which, as Lord Selborne observes, always enables a church, so long as it is not impeded from without, to exercise itself 'in the whole art and power of self-government, self-legislation, and self-expansion.' But the crisis called for new efforts and more powerful organisation. The order of deacons was restored or enlarged; an army of local collectors worked under them, and the money locally collected was paid into a central *Sustentation Fund* and equally divided among the ministers throughout Scotland. A hundred thousand pounds was subscribed for building the churches even before the day of the disruption: five hundred of them were built within the first year. Manses were erected; schools built for the schoolmasters, for they also had been obliged to leave the parish schools; colleges instituted for theological students, under professors now excluded by law from the universities; and a home mission or church extension scheme was founded, through whose influence the number of pastoral charges in the Free Church has been almost doubled. But the church found it impossible, even amid the struggles of its infancy, to confine itself within Scotland. All its missionaries throughout the world had left the state with it, and thrown up their

emoluments; and schemes and funds for foreign missions, for colonial missions, for continental missions, for Jewish missions, and a special scheme for the Highlands and Islands were instantly and simultaneously started. That enthusiasm should initiate all this in the moment of suffering was, perhaps, not wonderful: what is more noteworthy is the permanence of the results. During the earlier part of the first half-century of its existence the contributions of the Free Church maintained their average, and during the later part they have much increased it. The following are the figures for the year opening each decade: 1843, £363,871; 1853, £289,670; 1863, £343,626; 1873, £511,084; 1883, £628,222. The total for the forty years comes to nearly seventeen millions. In 1889 there were 1026 regular charges in the church.

The history of the Free Church since 1843 has reflected increasingly the general course of church life outside it in Scotland. In its earlier years it was much occupied, like every body on a national scale, with questions of centralisation as against local government. Thus, a controversy whether it should have one college or more was terminated by its adherents in Glasgow and Aberdeen liberally endowing, and so securing, the institutions in either city. In 1858 the *Cardross Case* arose, and created much interest, as raising legal questions affecting Free Church principles. But, while the earlier decisions of the Scottish courts in it appeared to threaten interference even with the internal action of churches, their later findings refused to the deposed minister of Cardross the means of prosecuting even that civil action of damages which the church professed their readiness to meet. In 1863 Dr Candlish and Dr Buchanan started the proposal of union with the United Presbyterian Church, which had by this time gathered into itself nearly all the Scottish secessions of the 18th century. Negotiations went on for years, and terminated in 1873 in a postponement of incorporating union, but with an obligation for a working agreement in the meantime, to include a 'mutual eligibility' of ministers from all the churches that had taken part in the negotiations. In 1874 patronage was abolished by parliament in the church established, without any proposed change upon the general Scottish law of church and state. The Free Church Assembly at once resolved that disestablishment was the proper remedy for the divisions of Scottish Presbyterianism (see note); and its union in 1876 with the Cameronian body (see CAMERONIANS) seemed to unite these ancient traditions with modern views. Theological questions of course retained their dominant interest; and in 1881 the church refused to retain Mr Robertson Smith as its professor in Aberdeen, while declining at the same time to affirm that his biblical views were heretical. This compromise was unsatisfactory to all sides. In 1889 a large committee was appointed to consider the question of revising the church's confession while maintaining its central doctrines of faith. In 1888 the General Assembly held its sittings in the capital of the Highlands, which it had only done once before, forty-five years earlier, in the eventful year 1843. Within this region its influence has from the beginning vastly exceeded that of the Established Church, although its Highland ministers are well known not to agree with their Lowland brethren about the necessity for creed revision and union with churches that renounce the establishment principle. The vitality within the church was evidenced by the warmth with which the effort was met to clear off all debt upon churches and manses before its jubilee year.

[NOTE.—It ought, however, to be stated that there was a substantial minority in the Assembly that dissented from the resolution as to disestablishment; and the members

of that minority claim that the sentiments of a much larger proportion of the membership of the church are in accord with theirs.]

See the authorised edition of the *Subordinate Standards of the Free Church*, with 'Claim of Right' and 'Protest,' &c. (1851); Buchanan's *Ten Years' Conflict* (1849); Taylor James, *The Law of Creeds in Scotland* (1867); and the official *Annals of the Disruption* (1876-77).

**Freedom of a City.** See BURGESS.

**Freedom of the Press.** See PRESS.

**Freehold, ESTATE OF** (*liberum tenementum*, 'frank tenement'). Tenures of land in England are divided into free and base or customary. Free tenures included the military tenures of knight-service (see TENURE), &c., now abolished, and tenure in free and common Soage (q.v.), which is now the only form of lay freehold. Copyhold (q.v.) is now the only form of customary tenure; it is hardly correct to speak of base tenure, since the personal incidents of villeinage have disappeared. 'Customary freehold,' so called, is only a privileged kind of copyhold. There is no necessary connection between the tenure and the quantity of the tenant's interest in the land; but in point of fact only an estate for life or an estate of inheritance ranks as a freehold; a term of years, however long, is less than freehold. Lands may be held by free tenure of the king or of the lord of a manor, but no new free tenure under a subject has been created since 1290, when the practice of subinfeudation was abolished by the statute of *Quia emptores*. At the present day almost all freeholders hold of the crown. Seisin or possession of the freehold was formerly an important point in the law of wills, conveyances, and actions relating to land. The freeholders of a county were constituent members of the ancient county court; they had formerly the right to vote in the election of county coroners; and freehold property of the value required by modern statutes is a qualification for jurymen and parliamentary electors, and for certain public offices. Rent-charges and other interests in land may be held in freehold.

**Free Imperial Cities,** in the German empire, were those cities which owed allegiance to none but the emperor, which exercised suzerain rights within their own territories, and had the right of sitting and voting in the imperial diet. At first free cities were distinguished from imperial cities, the difference consisting in the fact that the former paid no feudal dues to the emperor, whereas the latter did. But from the 13th century there was practically no distinction, all towns which formed an integral part of the imperial polity of states being called free imperial cities. These cities, which had not a uniform municipal organisation, some being governed on democratic, others on aristocratic principles, were generally ruled by one or two imperial officers, called *Reichsvogt*, *Schultheiss*, or *Burggraf*. The peculiar privileges attaching to these cities were acquired in different ways—by creation of the emperor, by purchasing freedom from the minor prince or lord to whom they owed allegiance, by the dying out of the family of the territorial superior, or by force of arms. And they were lost by the corresponding opposite means: some towns were seized by the neighbouring lords, others passed by conquest out of the empire altogether, others voluntarily sold their privileges of freedom, others again were deprived of their position by the emperor as punishment for contumacy. The creation of free imperial cities was generally encouraged by the emperors, who found in them a useful means of checkmating the ambitions of the petty princes. But between the 13th and 15th centuries the majority of them succeeded in securing the office of *Reichsvogt*,

*Schultheiss*, or *Burggraf* for their own citizens. In 1474 the free imperial cities formed two groups in the diet, the Rhenish and the Swabian; and they were formally constituted the third college of the diet after the Peace of Westphalia (1648). In February 1803 all the free imperial towns of Germany, except Hamburg, Lübeck, Bremen, Augsburg, Nuremberg, and Frankfurt-on-Main, lost their privileges; and of these Augsburg, Nuremberg, and Frankfurt ceased to be free imperial cities in 1806. In 1815, however, the three Hanse towns, together with Frankfurt, were admitted into the German Confederation as free towns. But by the incorporation of Frankfurt with Prussia in 1866 there were left but three free cities in Germany—Lübeck, Bremen, and Hamburg.

**Free-lances** were roving companies of knights and men-at-arms, who, especially after the Crusades had ceased to give them employment, wandered from state to state selling their services to any lord who was willing to purchase their aid in the perpetual feuds of the middle ages. In Italy they were known as *Condottieri* (q.v.). In Germany the name *Landsknechte* was given to a famous organisation of mercenary foot-soldiers, originally raised by Maximilian I. in 1487 from the inhabitants of his Austrian hereditary dominions. The name is not, as is commonly said, a corruption of *Lanzknechte* ('lancemen'), but was given to distinguish the men of the Austrian lands from the Swiss mercenaries. The Landsknechte played a distinguished part in the wars of the 15th and 16th centuries, but fell into disrepute after the Thirty Years' War, by which time their numbers were made up of recruits from all European countries.

**Freeman** is one who has inherited the full privileges and immunities of citizenship; *freedman*, one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. In old Rome, indeed, the equivalent for freeman (*liber homo*) comprehended all classes of those who were not slaves; but the distinction here pointed out was preserved by the application of the term *ingenuus* to him who was born free, and of *libertinus* to him who, being born in servitude, was emancipated. As the organisation of Roman society survived the convulsions of the middle ages to a far greater extent in the towns than in the landward districts, where the institutions of Feudalism (q.v.) almost entirely superseded it, it is in the borough and other municipal corporations that we still find *freemen*, or persons inheriting or acquiring by adoption, purchase, or apprenticeship the rights of citizenship. In Anglo-Saxon England the freemen were divided into *Ceorls* (q.v.) and *Eorls* (see EARLS). See BOROUGH, BURGESS, CITY, SLAVERY. In the United States the term *freedmen* was used of the coloured people emancipated by the civil war. The duty of caring for those helpless people, finding them work, organising education, and preparing them for the privileges of freedom was thrown on the war department; and in 1865 an act of congress created in that department the bureau commonly known as the 'Freedmen's Bureau,' whose duties practically ceased in 1870. The founding of several seminaries for coloured persons, such as Howard University and Fisk University, was a permanent result of its work.

**FREEMAN'S ROLL.**—By the Municipal Corporations Act of 1835 it was provided that every person who, if the act had not passed, would, as a burgess or freeman, have enjoyed, or might have acquired, the right of voting in the election of members of parliament was to be entitled to enjoy or acquire such right as heretofore. And it was further enacted

that the town-clerk of each borough should make out a list, to be called the *Freeman's Roll*, of all persons admitted burgesses or freemen, for the purpose of such reserved rights as aforesaid, as distinguished from the burgesses newly created by the act, and entitled to the rights which it newly conferred; these last were to be entered on another roll, to be called the *Burgess Roll*. See *BURGESS*.

**Freeman, EDWARD AUGUSTUS**, one of the most learned of English antiquaries and historians, born at Harborne in Staffordshire in 1823, was elected scholar of Trinity College, Oxford, in 1841, and fellow in 1845. He held the examinership in the School of Law and Modern History in 1837 and 1863, and in the School of Modern History in 1873; and was created D.C.L. of Oxford in 1870, and LL.D. of Cambridge in 1874. In 1884 he became regius professor of Modern History at Oxford. He has received decorations from Greece, Montenegro, and Servia, and has been created a corresponding member of learned societies at St Petersburg, Göttingen, and in Massachusetts. Freeman is a Liberal in politics, and contested Mid-Somerset in that interest in 1868, but without success. His principal work is his *History of the Norman Conquest* (5 vols. 1867-76), one of the greatest monuments of English historical learning, which shows its author to possess almost every requisite of an historical style save one—that of condensation. His other works include *A History of Architecture* (1849); *History and Conquests of the Saracens* (1856); *History of Federal Government* (vol. i. 1863); *History of the Cathedral Church of Wells* (1870); *Old English History* (1869); *Growth of the English Constitution* (1872); *Historical Essays* (3 series, 1872-79); *Comparative Politics* (1873); *Historical and Architectural Sketches*, chiefly Italian (1876); *The Ottoman Power in Europe* (1877); *Historical Geography of Europe* (2 vols. 1881); *The Reign of William Rufus, and the Accession of Henry I.* (2 vols. 1882); *Some Impressions of the United States* (1883); *English Towns and Districts* (1883); *Chief Periods of European History* (1886); *Methods of Historical Study* (1886); and *Exeter* (1887) in the series of 'Historic Towns.' Freeman is the leader of what has been called the Tentonic school in English history, and it is not improbable that, carried away by his prepossessions, he has placed too great reliance on the evidence offered by the language and institutions, and overestimated the Tentonic element in the blood of the English people. As an historian he shows equal erudition and accuracy; but his learning is marred by its pedantry: his argument, by its iteration; while his insight and breadth of view are scarce proportional to his knowledge. He maintains a high ideal of the dignity of real history and the necessity for truth, and has made unsparing onslaught on writers who make the true subordinate to the picturesque.

**Freemasons.** The masonic brotherhoods of the middle ages were organised incorporations, not substantially different in their nature from the other guilds, governed by rules of their own, and recruited from a body of apprentices who had undergone a period of probationary servitude. Fable and imagination have traced back the origin of freemasonry to the Knights Templars, the old Roman empire, the Pharaohs, Hiram of Tyre and the Temple of Solomon, or even the times of the Tower of Babel and of the Ark of Noah. The masonic craft in reality sprang into being about the same time and from the same set of causes as other incorporated crafts; but a variety of circumstances combined to give it an importance and influence beyond the rest. Men skilled in the hewing and setting of stones were

naturally prized in an eminently church-building age. Their vocation necessarily involved travelling from place to place in search of employment. Wherever a great church or cathedral was built the local masons had to be reinforced by a large accession of craftsmen from other parts; and the masons from neighbouring towns and districts flocked to the spot and took part in the work, living in a camp of huts reared beside the building on which they were engaged. A master presided over the whole, and was assisted by wardens having surveillance of the rest. A mason, therefore, after going through his apprenticeship and probations, could not settle down like other craftsmen among his neighbours and acquaintances, but must travel from place to place to find employment; hence it became desirable or necessary to devise means by which a person once a member of the fraternity might be universally accepted as such, without requiring, wherever he went, to give fresh evidence of his skill, or having to undergo a renewed examination on his qualifications. In order to accomplish this end, and to enable a mason travelling to his work to claim the hospitality of his brother-masons on his way, certain signs and words were conveyed to him, which he was bound to keep secret. This arrangement is the sole shadow of foundation for the popular notion that the masonic brethren were in possession of secrets of vital importance, the knowledge of which had been from generation to generation confined to their own order. It has been supposed that the possession of the masonic secrets enabled the masons to design the great cathedrals of the 13th and 14th centuries; whereas it is now certain that during the purest ages of Gothic architecture, both in France and in England, the architects were not members of the masonic fraternity at all, but either laymen of skill and taste, uninitiated in the mysteries of masoncraft, or oftener bishops and abbots. The masons who worked from the architect's design were, at the same time, not the mere human machines that modern workmen too generally are, but men who, in carrying out an idea imparted to them, could stamp an individuality of their own on every stone. Architecture was then a progressive art, and the architect of every great church or cathedral had made himself acquainted with the works of his predecessors, and profited by experience, adopting their beauties and shunning their defects. The nature of the advance which architecture was then making has been compared by Fergusson to the advance with which we are familiar in the present day in shipbuilding and other useful arts. 'Neither to the masons nor to their employers, nor to the Abbé Suger, Maurice de Sully, Robert de Suresnes, nor Fulbert de Chartres is the whole merit to be ascribed, but to all classes of the French community carrying on steadily a combined movement towards a well-defined end.' In Germany, however, the masons of the 14th century, who had attained a wonderful skill in carving and in constructing arches, overstepping their original functions, took to a great extent the office of architect into their own hands; and it is undeniable that the churches designed by German masons, though rich in the most exquisite workmanship, are not comparable in the higher elements of beauty to the works of non-masonic architects.

The epithet 'Free,' as applied to the craft, was originally used as an abbreviation of the term 'freemen masons'—free of their guild. Scotland possesses the earliest record of the presence of theoretical or speculative masons in mason lodges. This is shown in the minute of a conventicle of the Lodge of Edinburgh, held at Holyrood House in the year 1600.

The history of freemasonry has been overlaid with fiction and absurdity, partly from an exaggerated estimate of its importance in the development of architecture, and partly from a wish to connect mediæval masonry with the institution that passes under the same name in the present day. Modern (or so-called 'speculative') freemasonry is an innocent mystification unconnected either with the building craft or with architecture. It is of English origin, and dates from the 18th century. According to its peculiar phraseology, it is founded in the 'practice of moral and social virtue'; its distinguishing characteristic is charity, in its most extended sense; and brotherly love, relief, and truth are inculcated by its precepts. In freemasonry there are three grades—apprentice, fellow-craft, and master-mason; there being peculiar ceremonies at the making of each; and it is only on attaining to the degree of master-mason that a brother enjoys the full benefits and privileges of the craft.

The 'Lodges' of Scotland profess to trace their origin to the foreign masons who came to Scotland in the 12th century to build the Abbeys of Holyrood, Kilwinning, and Melrose. Those of England go still further back, to an assemblage of masons held by King Athelstan, at York, in 926. The mother-lodges of York and Kilwinning were the parents of many lodges erected in different parts of Great Britain; while several of the pre-18th century Scottish lodges were self-constituted. Towards the close of the 18th century it was in some quarters (as by Robison in his *Proof of a Conspiracy*, &c. 1797) made a charge against freemasonry that under its symbolism was concealed a dangerous conspiracy against all government and religion. The accusation was probably groundless enough as regards British freemasonry; and so little effect was produced by it that, in an act passed in 1799 for the suppression of secret societies, an exception was made in favour of freemasons. On the Continent political intriguers may sometimes have availed themselves of the secrecy afforded by freemasonry to further their schemes. In 1717 a Grand Lodge was formed in London, with power to grant charters to other lodges. Under its sanction the first edition of the constitutions of the fraternity was published. The Grand Lodge was for a length of time on an unfriendly footing with the lodge of York, in consequence of having introduced various innovations not approved of by the older lodge, and of having granted charters within the district which York claimed as its own. In 1782 the then Duke of Cumberland (brother of George III.) was elected Grand Master of the Grand Lodge; and on his death George IV., then Prince of Wales, succeeded to the office, which he continued to hold till he was appointed regent, when, it being considered unsuitable that he should longer exercise any personal superintendence, he took the title of Grand Patron. In 1813 an understanding and a union was brought about between the two rival Grand Lodges by their respective Grand Masters, the Dukes of Kent and Sussex. The fraternity has since been managed by the 'United Grand Lodge of Ancient Free and Accepted Masons of England,' consisting of the Grand Master, with his Deputy, Grand Wardens, and other officers, the provincial Grand Masters, and the Masters and Wardens of all regular lodges, with a certain number of stewards annually elected, who meet four times a year for the despatch of business, besides which there is an annual masonic festival, at which every mason is entitled to attend. The Grand Lodge of England has at present nearly two thousand lodges under its protection; the Prince of Wales was elected its Grand Master in 1874.

In Scotland the masons, when they were a real

company of artificers, were, like other handicrafts, governed by wardens of districts appointed by the king. In 1598 a reorganisation of the mason lodges was effected under William Schaw, principal warden and chief master of masons, who in the following year confirmed the three 'heid lodges' in their ancient order of priority—Edinburgh first, Kilwinning second, and Stirling third. In 1736, the operative element in mason lodges having become absorbed in speculative masonry, the Grand Lodge of Scotland was instituted by the representatives of thirty-four lodges, by whom also William St Clair of Roslin was elected Grand Master, on account of his ancestors' alleged ancient connection with the mason craft as patrons and protectors. Priority was assigned to the lodges according to the antiquity of their written records. The Lodge of Edinburgh (Mary's Chapel), with its records dating from 1590, was placed first, and Kilwinning, possessing records from 1642, second. The Lodge of Kilwinning did not formally object to this till 1744, when it withdrew from the Grand Lodge and resumed its independence. On relinquishing this position in 1807 it was re-admitted into the Grand Lodge by the title of Mother Kilwinning, with precedence over the other lodges, and the Provincial Grand Mastership of Ayrshire confirmed in perpetuity to its Master.

Besides granting charters of affiliation, the chief use of the Grand Lodge, whether of England or Scotland, consists in its acknowledged authority to enforce uniformity of ceremonial and other observances, and to settle all disputes that may arise within the lodges under its charge. In Scotland the officers and members of the Grand Lodge are delegates from the respective lodges; the delegation being the masters and wardens or their proxies. As a source of revenue, for each member made by a lodge a fee must be remitted to the Grand Lodge, whereupon a diploma of brotherhood will be issued. There are upwards of six hundred lodges under the Grand Lodge of Scotland. The Grand Lodge of Ireland, instituted in 1730, exercises jurisdiction over nine hundred lodges. There are funds of benevolence connected with each of the British Grand Lodges.

Modern freemasonry spread from Britain to the Continent, to America, and to India. It was introduced into France in 1725, into America in 1730, Russia in 1731, and Germany in 1740. Grand Lodges now exist in France, Belgium, Holland, Denmark, Sweden and Norway, Germany, Switzerland, Italy, Spain, Mexico, Egypt, Portugal, Greece, Canada, in Central and South America, in British Columbia, and in Australia. Lodges in connection with European grand bodies exist in India, China, Japan, Africa, Polynesia, Turkey, the West Indies, Syria, Newfoundland, and New Zealand. There are forty-eight Grand Lodges exercising control over nearly ten thousand lodges in the United States, and nowhere is masonry in greater honour or importance. Roman Catholics treat freemasonry as a pantheistic system, essentially opposed to belief in the personality of God, subversive of all legitimate authority, whether of the church or of the state—the hatching ground of most of the revolutionary societies of continental Europe (see Addis and Arnold's *Catholic Dictionary*, 1883). It has been expressly condemned by bulls from five popes.

The deep symbolical meaning supposed to be couched under the jargon of the masonic fraternity is as apocryphal as the dangers of masonry to government and order. A set of passwords and a peculiar grip of the hand enable the initiated to recognise each other, and give a zest to their convivial meetings; and, if the institution possesses any practical utility, it is in its enabling a mason,

in a place where he is a stranger, to make himself known to his brother-masons and claim their protection and assistance.

**Free Port**, a port at whose wharves the vessels of all nations can load and unload free of customs duties and commercial charges, with the exception of the usual harbour dues. A free port is thus, from the commercial point of view, an open harbour in contradistinction to one that is closed to all vessels except those of the country in which it is situated, and from the administrative point of view financially a foreign territory within the state to which it politically belongs. In the middle ages free ports were established for the purpose of attracting trade to particular maritime centres, especially by Italy, France, Spain, Austria, and Portugal, at the period when the exploitation of their colonies for the benefit of the mother-country was the ruling principle in the commercial policy of those states. In the end of the 18th and the beginning of the 19th century free ports acquired a position of peculiar importance during the years in which prohibitive and protectionist measures were in force. Since then, however, they have decreased both in importance and in number. At the present time their chief use is that of entrepôts for facilitating the more convenient interchange and distribution of commodities destined for more or less distant markets. To all intents and purposes their utility has been destroyed by the rival system of bonded warehousing, which has always prevailed in England and the United States in preference to the other system (see BONDED WAREHOUSES). In 1889 the only free ports remaining on the continent of Europe were Trieste and Fiume in Austria, and Hamburg and Bremen in Germany—the latter two having since 1888 only a restricted area within the free port. Trieste and Fiume ceased to be free ports in 1891, while in that year Copenhagen was made one. Among free ports outside of Europe are Hong-kong, Menado in Celebes, Singapore, Georgetown (Penang), Amboyna, Banda, Ternate, St Thomas (West Indies), Livingstone in Guatemala, and, since 1892, Zanzibar.

**Freeport**, capital of Stephenson county, Illinois, on the Pecatonica River, 121 miles WNW. of Chicago by rail, with a Presbyterian college and some manufactures. Pop. 8516.

**Freesoilers**, a political party in the United States, the outcome of the Wilmot (q.v.) proviso, founded in 1848 to oppose the extension of slavery to the territories. At Buffalo in that year they nominated Martin Van Buren for president and Charles Francis Adams for vice-president, who secured a popular vote of 291,000, but no electoral votes. In 1852 their candidates polled only 156,000 votes; but in the period of political agitation that followed the free-soil principles assumed great prominence, and were adopted by the Republicans, in whose party, on its organisation in 1856, the Freesoilers were absorbed.

**Free Spirit**, BRETHREN OF THE, a fanatical sect diffused (often secretly) over Germany, Italy, and France, between the 13th and 15th centuries. Their doctrine was a species of pantheistic mysticism, which they applied with fearless consistency to all the details of moral obligation. Often condemned as heretics, they suffered severely at the hands of the Inquisition; and were confounded with the Beghards and Beguines (q.v.). See BROTHERHOODS.

**Freestone**. See BUILDING STONE.

**Freethinkers**, a term used loosely of all who reject belief in divine revelation, but especially of the Deists. See DEISM.

**Free-town**, capital of Sierra Leone, a British settlement on the west coast of Africa, is situated on the north side of the peninsula of Sierra Leone, about 5 miles from the Atlantic. The town is enclosed by a range of wooded hills, and, though the temperature is tolerably uniform, the climate is unhealthy, especially for Europeans. Pop. (1881) 21,913, who consist almost exclusively of liberated Negroes. The town was originally founded, under the name of Granville-town, in 1787.

**Free Trade**. 'Free Trade' is often used in a loose popular sense as practically equivalent to freedom of contract and *laissez-faire*; and thus particular kinds of land laws, bimetalism, factory acts, and various regulations affecting labour and manufactures are spoken of as infringements of free trade. Nothing, however, is gained by giving such an extended meaning to a definite expression, perfectly clear and precise in the historical sense. Historically, free trade refers to a particular policy as regards international or foreign trade only, and its principal features are absence of differential duties, and of artificial encouragements, such as bounties, by which the home producer is favoured as compared with the foreigner in the same department. The essence of free trade is equality and uniformity in the financial treatment of home, colonial, and foreign produce of the same kind. Thus the imposition of taxes upon commodities merely for revenue purposes (e.g. the tax on tea in the United Kingdom) is not held to be an infringement of free trade. Similarly the absolute prohibition of the importation of certain articles, supposing that the production at home is equally prohibited (e.g. immoral books), would not offend against free trade in its historical sense.

The economic system opposed to free trade, and the essence of which lies in the preferential treatment of the products of the home country or of certain 'favoured' nations, has received different names according to the objects professedly in view. When Adam Smith advocated the principles of free trade, he attacked the elaborate economic policy known as the Commercial or Mercantile System (q.v.). Of this system, protection to home industries was only a part. At least equal stress was laid upon a favourable balance of trade which was supposed to be indicated by a balance of the precious metals being due to a country. By this principle of a favourable balance a government was guided in framing commercial treaties and in the treatment of its colonies. At a later date, however, the use of the term protection was extended to cover practically the same ground as the expression 'Mercantile System,' which fell into disuse. Still more recently the name 'fair trade' has been invented to describe a mild form of the protective system, in which the basis of economic policy is supposed to be reciprocity or free trade only with such nations as grant similar privileges. Sometimes 'fair trade' is also held to include differential treatment of colonies by the mother-country as against foreigners, and is thus associated with

schemes for imperial federation. It is worth noting that up to the beginning of the 19th century fair trade was the polite name for smuggling, and that, according to Adam Smith, 'to pretend to have any scruple about buying smuggled goods would, in most countries, be regarded as a pedantic piece of hypocrisy.'

The principal practical difficulty in deciding whether a tax is really opposed to free-trade principles arises in the case of the possible use of substitutes. If, for example, the cheaper kinds of foreign wines are being taxed avowedly for revenue purposes only, an indirect encouragement may at the same time be given to the production and consumption of beer in the home country. Again, it is difficult in many cases to find a fair common measure for home and foreign articles, and thus to make customs and excise duties really equivalent. In wines and spirits the alcoholic test alone is obviously unfair, but it is difficult to decide how much should be fairly allowed for other qualities. Nor will a simple *ad valorem* tax be a sufficient guide, because the effect upon demand of a rise in price is different in different cases. It may even be said that all taxation of those foreign goods which, from the nature of the case, cannot be produced at home (such as tropical products in the temperate zones) furnishes an artificial encouragement to home industries. If, for example, tea and coffee are rendered very dear by taxation, the use of acrated waters and home-made wines may be stimulated. The case of drawbacks, in which an excise duty is drawn back upon the exportation of the article taxed, presents similar difficulties. If the drawback really exceeds the tax already paid, it amounts to a bounty; and in fact most of the bounties given upon exportation are disguised in the form of drawbacks.

Taking free trade in this historical if somewhat narrow meaning, it is convenient to examine the general economic theory on which the policy rests before giving actual examples of free-trade policy and its opposite, protection. The question is, 'Why should a nation give no preference to its own subjects over foreigners in the financial treatment of commodities in general, or at least of some particular kinds?' It will be seen at once that the establishment of a universal negative in any question of practical politics is only possible by making very stringent assumptions as to the object or end of political union. Suppose, for example, that we accept the maxim of Adam Smith, that defence is of far more importance than opulence, we at once make out a *prima facie* case for the encouragement of those industries—e.g. shipbuilding and navigation—which may be assumed indirectly to contribute to national defence; and we understand why Adam Smith considered the Navigation Acts to be the wisest commercial provisions in the statute-book. Similarly various other social or political objects may be thought so desirable that the state ought to use its influence, by adjusting industrial finance, in order to promote these objects. It may be argued, for instance, that the state should look to the conditions under which labour does its work quite as much as to the mere cheapness of the final product; and that a nation ought to consider much more than individuals can be expected to do the remote consequences of certain lines of industrial development. In this way the arguments for protection founded upon a variety of industries, the possible exhaustion of peculiar natural resources, the encouragement of the growth of towns and manufactures in young countries, must be deemed *prima facie* worthy of consideration; although, of course, it may prove in the sequel that free trade is much more likely than protection to attain these

and other important social ends, in addition to cheapness and plenty.

It is necessary, then, in order to understand the purely economic theory of free trade, to omit provisionally, for the sake of simplicity, not only many possible objects of financial policy, but also various considerations of great social and moral importance. We must begin by regarding the primary object aimed at as the present acquisition of the means of satisfying material wants at a minimum real cost—that is to say, the question must first of all be considered from the point of view of the consumer for the time being. With this narrow view of the subject it is easy to establish the case in favour of free trade. For with freedom of competition no foreign commodity would be imported unless it could be sold at least as cheaply as when produced at home, and the natural result of competition would be to lower the price; hence, to discourage importation by differential taxation would be to raise prices by restraining competition. Again, to artificially encourage exportation by means of a bounty may by diminishing the supply in the home-market raise the price; and, if an increased supply can only be obtained at an increasing cost, this must be the result. But although free trade may result, as just shown, in present maximum cheapness, it may be objected that all cheapness is relative to the means of purchase—i.e. to income—and that, if the former is promoted by free trade, the latter is augmented by protection. And at first sight it seems plausible to argue that if a certain policy increases employment it increases earnings, and that employment must be increased by encouraging home industry at the expense of foreign. The refutation of this fallacy in its grossest form is one of the greatest triumphs of the so-called orthodox political economists. Bastiat, for example, in his famous petition of the candle-makers against the sun, in which it is ironically shown how much encouragement would be given to all the industries directly and indirectly concerned in the production of artificial light by shutting up windows, &c., has made clear the error involved in 'making work,' or in increasing obstacles in order to encourage employment. Again, whilst it is allowed by free-traders that protection to any particular industry may turn more labour and capital into that channel, and thus increase the gross earnings of those employed in it, it is maintained that on the whole, from the national point of view, there is a loss. In the first place, the very object of protection is to raise the price above what it would be if foreign imports were admitted freely, and thus the large body of consumers (including other labourers) are taxed for the benefit of the small class of producers. Secondly, the labour and capital of the country are drawn from the channels into which they would naturally flow, and are thus on the whole less advantageously employed; in other words, the gross annual produce of the land and labour of the society is less than it otherwise would have been. If, for example, by the exclusion of foreign corn the price is raised, not only are consumers taxed by the rise in price, but the labour and capital devoted to the production of corn are drawn from other employments, in which more commodities might have been produced, and on balance exchanged for more corn. We thus arrive at the great maxim of free-traders, that imports are paid for by exports, and 'if you take care of the imports the exports will take care of themselves'—in other words, if foreign labour is encouraged by the free admission of foreign goods, still, *ipso facto*, the home industry must be equally encouraged, because goods to an equal value must be made to be exported to pay for these imports. In fact, it is maintained that the home industry is

more encouraged than otherwise would be the case, because there is less waste of labour, capital, and natural resources. A certain quantity of labour and capital devoted to the more careful cultivation of land would raise more agricultural produce, but if devoted to some kind of export, this export might obtain by exchange far more corn raised at much less expense on virgin soil.

To the statement, however, that a country need regard only its exports, preliminary objection may be raised on the same ground on which the above maxim itself is really founded—viz. that all trade is reciprocal, and that ultimately imports and exports are a form of barter. For it may be said that, unless a country's exports are sent by the best route to the best market, they cannot purchase so great a quantity of imports, and it is quite as reasonable to regard the export trade as active, and the import trade as passive, instead of the converse. Suppose, for example, to take an extreme case, all other nations effectually prevented the importation of English manufactures, England would be unable to pay for its imports, and imports must cease. And, without going so far, it may still be maintained (as by Adam Smith) that distant and roundabout trades are not so advantageous to a country as near and direct trades.

Apart from this objection the position of free-traders appears to be sound under the assumptions usually made. These assumptions, however, require careful statement. In the first place, it is assumed that labour and capital can without loss or difficulty be turned from a decaying into a thriving industry, and that, if any home product is displaced by foreign competition, 'something else' will be made with the same labour and capital. But it may be objected that every industry requires a certain amount of specialised capital and peculiar skill and training which cannot be transferred to other employments; capital and labour, for example, formerly used in agriculture cannot without great loss be turned into the manufacture of cotton goods. There is some force in this objection, and Adam Smith placed it under the possible exceptions to a general free-trade policy which he considered worthy of consideration. At the same time, as he points out, there is a tendency to exaggerate the difficulty of absorbing any surplus labour set free from an old industry, and at any rate the argument is one not for absolute protection, but for partial protection during a limited transition period, whilst labour and capital are being withdrawn. There is, however, a more serious objection to this assumption of the perfect mobility of labour and capital from one industry to another. A merchant, as Adam Smith said, is a citizen of no particular country, and if capital and labour are supposed to move without any difficulty within the limits of one country, their migration from country to country cannot be considered, especially in modern times, to offer any insuperable difficulty. Thus, it is theoretically possible that under the stress of foreign competition agriculturists might take their labour and capital from the United Kingdom to the United States, instead of to the cotton-mills of Lancashire or the coal-mines of Northumberland. The result would be that a trade formerly conducted between the rural and the manufacturing districts of England would now be conducted between the latter and the western states of America. Nor is this migration of industries a pure theory; we find many examples in history not only of the transference of industries from one part of the same country to another, but also from one country to another. Whether this transference would have been prevented by protection is, of course, a matter for further inquiry; the point at issue at present is simply the possi-

bility of the free-trade assumption, that any displaced capital and labour will find employment within the country, not being realised. The importance of the exception is seen from a popular argument, often used as a rough and ready proof of free trade—viz. that if protection is a good thing for one country against another, it must be good for one district, county, town, &c. against others in the same country. But the answer is obvious, that, although from the national point of view the migration of industries within the country is a matter of indifference, it is a matter of supreme importance to the districts affected; and historically it may be noted that in England, as in other countries during the medieval period, the towns adopted stringent protective measures against one another; and, although this parochial patriotism has disappeared to a great extent, the commercial rivalry of nations is as strong as ever.

It is worth observing that Adam Smith always emphasised the importance to a country of employing its capital, so far as possible, within its own borders, and if it were employed out of the country he ranked the relative advantages according to the nearness of the foreign locality and the frequency of the returns. And, in his view, it was not a question of profit, for he expressly says that greater profits may be earned in distant than in near trades, and in foreign countries than at home. But the point is that if the capital is employed at home the labour of the country finds employment at home, and the home country enjoys the things produced. Suppose, for example, that a large quantity of British capital is exported to make harbours, railways, &c. in a foreign state; greater profits may be earned, but so far there will be less employment for British labourers whilst the works are being made, and when they are finished the benefits of use will be enjoyed by the foreigner. Many of the successors of Adam Smith, in their eagerness to give free trade the simplicity of an axiom, have omitted from their argument the element of nationality, and have forgotten that there is a question of 'somewhere else' as well as of 'something else.' The great merit of Adam Smith is that he fully recognises at every stage of his reasoning the difficulties which spring from territory being of the essence of the modern nation; and instead of arguing simply (but illogically) that, because universal free trade would be good for the world at large, therefore it would be equally good for every part of it, he maintains that, taking everything into account, and giving due weight to the principle of nationality, the interest of a particular nation would be advanced by free trade and retarded by protection or artificial management on the part of government. At the same time, however, it may be admitted that in some respects Adam Smith's argument needs development, because no economist would now feel justified in laying so much stress as he did upon reasons drawn from a peculiar view of natural theology and an optimistic mode of regarding the operations of nature. No matter how strong may be the belief in the beneficent guidance of an 'invisible hand' which leads the individual, whilst pursuing his own interest, to promote that of the public, it is necessary to give more specific grounds, and of a more purely economic character, in deciding between two methods of taxation and two methods of conducting international trade. Certainly, too much reliance must not be laid on the general argument derived from a survey of life as a whole in an age in which nature has come to be regarded as 'red in tooth and claw,' and as working out its ends by a prodigal waste of suffering and misapplied effect. It will be found, however, that the principal result of Adam Smith's natural

theology has been negative omission rather than positive error.

Taking the world as a whole at any particular time, we can easily see that free trade would give the most advantageous employment of labour and capital, because everything would be produced under the most favourable conditions; but the difficulty is to show that free trade is the best policy for a country which adopts Adam Smith's fundamental position as to the relative advantage of keeping capital and labour employed within its own borders. On this view it is not enough to show that under free trade the consumer would obtain maximum cheapness and the capitalist maximum profits, but we must also show that the nation makes the best use of its resources for its own members. The arguments relied upon by Adam Smith are partly positive and partly negative, the former being based on the power of the self-interest of individuals, and the latter on the weakness of governmental control. Every person, he says, naturally prefers to employ his capital in the support of domestic industry, but then this qualifying clause is added, 'provided always that he can thereby obtain the ordinary, or not a great deal less than the ordinary, profits of stock.' This leaves the position open to the attack that, by supporting foreign in place of home industry, the individual may obtain more profits; or more generally that profit, as Adam Smith himself often points out, is not synonymous with national advantage. But the objection is not so serious as at first sight appears. For, in the first place, if capital when employed at home does not obtain ordinary profits, a check will be placed on accumulation, and it is certainly more advantageous for a nation to employ some of its surplus capital abroad, or in encouraging foreign industries, than to have no surplus through forcing it to stay at home; secondly, it must be noted that most of those who support a protectionist policy, on the ground of encouraging home industry, estimate the encouragement given by the profit earned, and would to the last disapprove of any policy which would lead to less than the ordinary rate being obtained.

It may, however, be further objected that by protection to home industries, and by the prevention of the admission of certain kinds of foreign goods, more capital may be employed at home at the ordinary rate of profit. The usual answer is that this capital must be drawn from other more advantageous industries also at home; but in an old country in which profit is at a minimum and capital overflowing its channels this answer does not hold good. It is true that the consumers of the protected article lose so much by the rise in price, but it may be rejoined that to the nation this loss is more than compensated by the increase in the field for employment. Again, take a simple hypothetical case. Suppose that a new country yields only agricultural produce, and exchanges part of this for manufactures. If it imposes protective duties on manufactures, and if it can provide, through the growth of wealth and population, the necessary labour and capital without diminishing the amount of agricultural produce, the result is that its agricultural labour supports its own instead of foreign cities. Under the supposition made, the agriculturists will obtain less home manufactures than they would have done from abroad, at least for a time, but it is possible that the diversion of labour and capital may ultimately result in more wealth. In the ordinary argument for free trade sufficient allowance is not made for the growth of capital and population, nor for the advantages to be gained from employing them within the country. The question is regarded exclusively from the point of view of the consumer,

under the hypothesis of a fixed amount of labour and capital already fully employed in the most advantageous manner.

The theoretical exception to free trade which has just been considered may be strengthened by the argument drawn from the stimulus given to production by a variety of industries, and by promoting trade directly between the towns and the neighbouring country districts, a consideration which was the basis of Wakefield's scheme of colonisation. It is urged, especially in the case of new countries, that, unless towns are encouraged by the protection of manufactures, there will not be a ready market for all the by-products of agriculture.

At this stage it may be well to note the other principal exceptions which have been taken to free trade from the nationalist standpoint. It is said that every nation should retain for the benefit of its own people any peculiar natural resources, and if possible also any inventions and artificial means of production. In the United Kingdom, for example, one of the principal causes of commercial supremacy is always said to be the close proximity of excellent coal and iron fields. But coal and iron are exhaustible, and the more they are exported so much the sooner will the point of exhaustion be reached. It is maintained that in the interests of posterity we should sacrifice the profits of a present trade and restrain the exportation. Carey even argues that the continuous exportation of all raw produce is practically equivalent to the exportation of the soil. In former times the wool of England was supposed (though, as is shown in Smith's *Memoirs of Wool*, probably without good cause) to be much superior to that of other countries, and accordingly, after being for some centuries the great staple of export, the exportation was later on forbidden under most severe penalties, and similar penalties were imposed on the exporters of sheep and rams. The same policy was carried out in reference to machinery and the instruments of production generally, including 'the living instrument' man. The answer made to this case of protection on the part of free trade is that it is impossible to tell, as regards the remote future, whether the peculiar advantage attaching to natural resources will continue (e.g. coal with the development of electricity from other forms of energy), and that, as regards instruments, they can be copied and imitated although the actual exportation is prevented. It is also argued that restraints upon the production of machinery by limiting the market will tend to check the progress of invention.

Another exception to free trade has been made on the ground of national independence. As already noted, it was on this ground that Adam Smith approved of the Navigation Acts. Recently the increasing dependence of the United Kingdom upon foreign nations for its food-supplies (see *Food*) has attracted much attention, and has led to proposals for differential duties in favour of the colonies. The same argument was the principal one used in the long agitation which resulted in the repeal of the Corn Laws. The answer is that cheap food is of such importance to the masses of the people that nothing which would raise its price would be assented to, and that indirectly through the growth of wealth and population under the stimulus of cheap food the nation has become much stronger than it would have been if it had tried to preserve its independence. Further, it is said that the dependence is really mutual, and that the food-growing countries rely upon selling their food to obtain clothes and other necessities just as much as the importers of food rely upon them.

A favourite exception to free trade is that a

nation ought to consider principally, not the cheapness of goods to the consumer, but the effect of the conditions of labour upon the producer. No nation would be content with being the hewer of wood and drawer of water to the rest of the world, and the more a nation is composed of highly-skilled workers engaged in healthy, pleasant, and energizing occupations, so much the better. It is assumed that, if by protective or prohibitive duties foreign wares of the higher class be excluded, they will be produced at home by native artists and craftsmen. It is, however, more probable that many of the articles would not be produced at all, and that in any case the absence of the foreign stimulus would eventually check the higher industrial development. If, for example, foreign paintings were excluded from a country to encourage painting, and engravings to encourage engraving, and so on, it is more than probable that the art of the country in question would lose not only in quality but in quantity. It may also be pointed out that the best way to promote the higher forms of industry is not by the simple process of exclusion, but rather by an elaborate system of technical and artistic education. The protectionist is always in danger of forgetting that it is not enough to show that certain ends are worthy of attainment, but that he must also prove that the rough and ready device of excluding foreign competition is the best means to adopt.

At this point it is convenient to complete the positive argument in favour of free trade. Hitherto the question has been regarded on the free-trade side mainly from the point of view of cheapness to the consumer, whilst abundant and varied employment for the producer and other important social aims have only been considered as possible grounds of exception to a free-trade policy. But Adam Smith, especially, and many of his successors have supported free trade with these objects professedly aimed at by protectionists always in view. Freedom of action and freedom of movement free-traders hold to give the greatest encouragement to the development of enterprise, and to the progress of invention, and thus indirectly at least to the employment of labour in a variety of industries. The natural result of free trade is to increase the efficiency of labour and capital through the stimulus of open competition, whilst the natural result of protection is to establish routine methods. Here it is important to observe that the practical abandonment of the wages-fund theory, according to which wages were supposed to be paid simply out of pre-accumulated capital, for the theory that wages are paid out of the price of the produce of labour, renders the usual statement of the theory of free trade, from the standpoint of capital only, incomplete and one-sided. The new theory of wages adds, however, much force to the position that the efficiency of labour is, on the whole, increased by free trade and diminished by protection. Again, under free trade an industry which ceases to be profitable, and to satisfy consumers, on the opening up of foreign markets is soon abandoned with a loss only to those engaged in it at the time, whilst under protection vested interests are created, and the loss is perpetuated. It must, however, be allowed that this argument from the absence of the stimulus of competition under protection loses force in proportion to the area, wealth, and population of the country to which it is applied. In the United States, for example, there is abundant scope for competition, and the same remark applies to a possible federation of the colonies and dependencies of the British empire.

On the whole, then, so far as the positive arguments are concerned, by which free trade is generally supported, it must be allowed that it is easy from the national standpoint to discover hypothetical exceptions, which might be thought, to adopt

Smith's language, 'worthy of deliberation.' And, contrary to the popular opinion in England, most economists of repute have allowed theoretically that under certain circumstances a country might gain by stepping aside from a general policy of free trade. Adam Smith, in addition to the exceptions already noted, approves of retaliation, if by that means a great market might be secured for exports; Ricardo points out a mode by which a country might gain by the monopoly of its colonial trade, and J. S. Mill allows that the Navigation Acts, though economically disadvantageous, were politically expedient, and also supports the argument derived from Adam Smith in favour of temporary protection, with a view to the more speedy development of industries for which a new country seems naturally adapted. The latest systematic English writer on the subject, Professor Sidgwick, expressly says that, when the matter is considered from the point of view of abstract theory, it is easy to show that protection, under certain not improbable circumstances, would yield a direct economic gain to the protecting country.

But it must always be remembered that the positive argument in support of a general free-trade policy is only part, and probably the least important part, of the case. It is one thing to allow that, provided a government is perfectly wise and able at once to change its policy according to the variations of industry, it might use its power in such a manner as to direct the capital and labour of the country into more advantageous channels than those of pure free trade; but it is quite another thing to admit that any government would be capable of managing the industries of a great nation in this way. Those who quote Adam Smith for his theoretical exceptions forget that he always laid most stress on the negative side of the argument—that is to say, on the weakness and incapacity of governments. 'The statesman,' he writes, 'who should attempt to direct private people in what manner they ought to employ their capitals, would assume an authority which could safely be trusted not only to no single person, but to no council or senate whatever.' The clearest illustrations in support of this position are found in the commercial history of England. Even in the middle ages, when changes were comparatively slow and competition was fettered in all directions by custom and routine, the government was unable to carry out the objects which it had in view in protecting certain native industries. It is worth noting also that several important manufactures took their rise through imitation of foreign wares, under the guidance of foreign workmen, in direct opposition to the supposed interests of home producers. It is a curious fact that precisely that part of the old commercial system which was most approved of by Adam Smith—viz. the Navigation Laws—was the first to be seriously attacked on the ground of the practical difficulties involved. These acts naturally induced foreign nations to retaliate, and the attempt to obviate this difficulty by means of reciprocity treaties led to still further complications with other countries. Apart from the peculiar practical difficulties that arise in particular cases, certain general reasons may be given why protection is likely to fail when everything is taken into account. The taxation for protective purposes of any product necessarily involves the taxation of substitutes; and since in general a duty so far as it is protective is not productive of revenue, for the main object of protection is to exclude the foreign product, there is the expense of supervising and guarding against the evasion of a number of unproductive taxes. Apart from these indirect evils, the real incidence of import duties is extremely difficult to determine. Again, in every industry there

are always a certain number of producers and traders on the margin of bankruptcy, and they ascribe their failure to the insufficiency of the duties. Thus a duty which at first might have been proposed as a temporary expedient tends not only to become perpetual, but to increase. It is well known, for example, that under the old Corn Laws there was a constant demand for increasing protective duties. Those actually engaged in any industry at the time when protection is given may gain immediately through obtaining a practical monopoly of the market, and exceptional profits and wages may be obtained until they are reduced by competition. But when those employed in other industries see this apparent advantage obtained by the favoured industry, they also naturally clamour for protection, and thus the interference of government once begun spreads with increasing rapidity, a fact which has found illustration in every protectionist country. The insuperable practical difficulty is not only to decide on national grounds what industries should be protected, but afterwards to persuade those engaged in other employments that they do not require protection. Hence it is easy to understand why under the old system England and other countries were practically compelled to impose a general duty upon all foreign manufactures not specially taxed. Thus the general result of protection is to stifle foreign trade, and indirectly, by entailing the market for exports, to fetter home industries. To render the negative argument in support of free trade complete, it would be necessary to take into account also the more general arguments advanced in support of natural liberty as against governmental interference—e.g. the increasing burdens of the necessary functions of government with the progress of civilisation, the dangers of the increase of power by increasing the functions of officials, the evils of restraints upon individual liberty, &c., which obviously have an important bearing upon the particular case of protection, but which are too general to be more than indicated in a special article. When on the one side the simplicity of free trade is considered, and on the other a complete survey is made of the practical difficulties involved in protection, compared with the doubtful advantages to be gained in the exceptional theoretical cases noted, and when it is borne in mind that the objects avowedly aimed at by protectionists—e.g. variety, skill, national independence, &c.—are much more likely to be obtained by other social methods under the system of natural liberty than by the simple device of imposing heavy taxes on foreign goods, a strong case is made out on balance for adopting free trade as the general rule of industrial policy; and in all probability free trade would have been more generally adopted, if the economical arguments had not been overshadowed by political prejudices, resting on very different foundations.

The question of Free Trade and Protection is discussed at length in all the text-books on political economy; and to PROTECTION we ourselves devote a special article. The introductory essay in Macculloch's edition of the *Wealth of Nations* (1828; new ed. 1857), still the great storehouse of facts and theories, gives a good account of the literature of the subject previous to Adam Smith. The principal subsequent addition to the arguments for free trade is the theory of foreign trade in Ricardo's *Principles* (1817), developed by J. S. Mill, Cairnes, and more recently by Professor Bastable, and criticised somewhat adversely by the French mathematician and economist Cournot, and by H. Sidgwick. Popular expositions of free-trade principles are well represented by Chevalier's *Examination of the Commercial System, known as Protection*, Bastiat's *Sophismes économiques* (Eng. trans., *Popular Fallacies regarding General Interests*, 1846), Sir Thomas H. Farrer's *Free Trade versus Fair Trade* (1885), Fawcett's *Free Trade and Protection* (1878; 6th ed. 1885).

The history of the free-trade movement in England is given in John Morley's *Life of Cobden* (1881). The best-known writers on the protectionist side are the American economist Carey, in *Principles of Social Science* (1858-59), and the German economist List, in *National Systems of Political Economy* (1841; 7th ed. 1884). A judicial account of the principal arguments on both sides is given in the article on 'Trade' by Professor Lexis, in the German *Handbook of Political Economy*, edited by Schönberg (2d ed. 3 vols. 1885-86).

**Free-will.** See WILL.

**Freezing Mixtures.** When matter passes from the solid to the liquid, or from the liquid to the gaseous (or vaporous) state, a considerable quantity of heat in general disappears or is rendered 'latent,' owing to the fact that, energy being required to effect these changes of molecular state, it is taken from the energy in the form of heat already existing in the substance; and this abstraction of heat causes a fall of temperature (see HEAT; MATTER, STATES OF). This property is taken advantage of for the production of low temperatures. The solution of a salt in a liquid, and the liquefaction of two or more solid substances when mixed, are both examples of the change from the solid to the liquid state, accompanied by a lowering of temperature, unless this be neutralised by heat developed by some purely chemical action. The following table gives the composition of freezing mixtures commonly in use. The solid materials should be finely powdered and intimately mixed together in a vessel of low thermal conductivity. The first column of the table gives the components in each mixture; the second their relative proportions by weight; in the third the resulting temperature (Centigrade) of the mixture, assuming that, with the exception of snow or ice, the temperature of the materials previous to mixture is 10° C. The fourth column gives the diminution of temperature in degrees Centigrade:

| Components.                       | Relative proportion by weight. | Temperature of mixture. | Diminution of temperature. |
|-----------------------------------|--------------------------------|-------------------------|----------------------------|
| Water.....                        | 1                              | 16°                     | 20°                        |
| Ammonium nitrate.....             | 1                              | ..                      | 20°                        |
| Snow or pounded ice.....          | 5                              | ..                      | 20°                        |
| Common salt.....                  | 2                              | ..                      | 45°                        |
| Snow or pounded ice.....          | 1                              | ..                      | 45°                        |
| Calcium chloride, crystals.....   | 2                              | ..                      | 45°                        |
| Ammonium nitrate.....             | 1                              | 14°                     | 29°                        |
| Sodium carbonate.....             | 1                              | ..                      | 29°                        |
| Water.....                        | 1                              | ..                      | 29°                        |
| Sodium phosphate.....             | 27                             | 29°                     | 59°                        |
| Ammonium nitrate.....             | 18                             | ..                      | 59°                        |
| Fuming nitrous acid.....          | 8                              | ..                      | 59°                        |
| Water.....                        | 4                              | 18°                     | ..                         |
| Sodium sulphate.....              | 8                              | ..                      | ..                         |
| Hydrochloric acid.....            | 5                              | ..                      | ..                         |
| Snow.....                         | 8                              | 32°                     | 42°                        |
| Hydrochloric acid (at 0° C.)..... | 5                              | ..                      | 42°                        |

Such mixtures are only applicable where a low temperature is required for a short space of time, and are of no use where a continuous process of refrigeration is necessary. For this latter purpose the low temperature produced by the expansion of gases and vapours is chiefly used, the principal substances employed being water, ether, ammonia, and carbon bisulphite. A full account of these processes, and of the apparatus connected with them, will be found under REFRIGERATION. Low temperatures are also obtained by the evaporation of a liquid, either under artificially diminished pressure, or where its vapour pressure is constantly small; the energy necessary to effect the change of state being taken from the heat in the substance itself. The evaporation (and consequent cooling) of water from the surface of porous earthenware vessels, called water-coolers, is due to this principle. The same is true of the formation of ice in shallow lakes at night in tropical climates.

The extremely low temperatures reached by Natterer and others, in their experiments on the

liquefaction of gas, were obtained by a mixture of solid carbonic anhydride and ether; or of solid nitrous oxide and carbon bisulphide. By such means the temperature of  $-140^{\circ}$  C., the lowest yet attained, was reached. See also COLD, FROST, ICE, THERMOMETER, WATER.

**Freiberg**, an ancient city of Germany, the centre of administration for the Saxon mines, is situated on the northern slope of the Erzgebirge Mountains, at a railway junction, 20 miles SW. of Dresden. The existing cathedral, built in the late Gothic style, on the site of an earlier one (burned in 1484), contains tombs of the Saxon electors of the Albertine line, and has a Romanesque portal called the Golden Gate. The town owes its origin to its silver-mines, discovered about the year 1163. Parts of the ancient walls and flanking towers still remain. At the school of mines, founded in 1765, the most famous institution of the kind in Europe, instruction is given in surveying, mining, the preparation of ores, geology, mineralogy, &c. It possesses a laboratory, a library, a collection of mining models, and mineralogical and geological collections. The mineral ores extracted near Freiberg are silver, bismuth, nickel, cobalt, zinc, arsenic, &c., the mines giving employment to about 6800 men. The manufactures consist principally of gold and silver ware, wire, chemicals, machines, leather, and cigars. Founded in 1175, Freiberg suffered more than once in the Thirty Years' War and the Seven Years' War. Pop. (1875) 23,559; (1885) 27,266.

**Freiburg**, or **FRIBOURG**, a canton of Switzerland, bounded on the N. and E. by Bern, and on the S. and W. by Vaud and the Lake of Neuchâtel, with three enclaves in Vaud. Area, 644 sq. m.; pop. (1880) 115,400, principally of French descent and Roman Catholics in religion. The official language is French, but all the laws and decrees binding on the whole canton are published in both French and German. The surface is hilly, the canton being invaded by offshoots of the Bernese Alps, which rise to upwards of 7000 feet in height. The river Saane or Sarine, a tributary of the Rhine, traverses almost the whole extent of the canton from its southern to its northern extremity. The country abounds in excellent meadows and pastures, upon which are reared fine breeds of horses and cattle. Dairy-farming, especially cheese-making (Gruyère), is pursued with great success. The other chief pursuits are agriculture, watch-making, and straw-plaiting. Timber, cheese, and cherry brandy are exported. Freiburg was received as a member of the Swiss confederation in 1481, and in 1848 a liberal constitution was established, but revised in a reactionary direction in 1857. It sends six members to the national council.—The capital is Freiburg, or Fribourg, on the Saane, 19 miles by rail SW. of Bern. The town is built in the valley and up the slopes of the hill to the edge of the precipice overhanging the river. The banks of the Saane (Sarine) are united by a suspension bridge, 870 feet long (see BRIDGE, vol. ii. p. 445). The church of St Nicholas, a fine Gothic structure, begun in 1283, has one of the finest-toned organs in Europe, and a lofty belfry. Pop. (1885) 11,840.

**Freiburg** IN BRISGAU, a town of Germany, in the grand-duchy of Baden, is situated on the western edge of the Black Forest, 32 miles NNE. of Basel. It is an open, well-built town; the walls and ditches with which it was formerly surrounded have been converted into promenades and vineyards. The cathedral, one of the most beautiful and perfect specimens of Gothic architecture in Germany, cruciform in shape, and built of red sandstone, was begun in 1122, but not completed till 1513. Its western steeple, 381 feet high, is

remarkable for its elegance and lightness. The university, which was founded in 1455, in 1888 had 87 professors and teachers and 884 students. The chief manufactures are sewing silk, cotton and thread, buttons, artificial beads, chicory, paper, parquetry, &c. Wine and timber are the chief articles of trade. Pop. (1865) 19,085; (1885) 41,310, of whom more than one-half are Protestants. Freiburg is the seat of a Catholic archbishop. Founded in 1091 by the Duke of Zähringen, and created a town in 1115, Freiburg has repeatedly changed masters; twice it was given over to France (1679–97 and 1744–48). It also played an eventful part in the Thirty Years' War. In 1806 it fell to Baden; and in 1848 the Baden revolutionists were defeated here by the troops of the German confederation.

**Freight** is the reward paid to the owner of a ship for the carriage and safe delivery of goods. A person chartering a ship pays freight for the goods sent by it, and dead freight in respect of any deficiency of cargo; the terms of the agreement are fixed by the Charter-party (q.v.). A person sending goods by a general ship pays freight for them; and the contract takes the form of a bill of lading. So far as the rights of parties are not made the subjects of positive stipulation in the contract of affreightment, they are ascertained with reference to the usage of trade. The carrier's duty is to have the ship ready to start at the time appointed (wind and weather permitting), and to receive the goods and carry them to their destination; having performed these duties, he has a lien on the goods and a right of action in case of non-payment of freight. The shipper's duty is to have his goods forward in time. Freight is not usually payable unless the voyage is completed; but it is sometimes prepaid, in whole or in part, at the risk of the shipper. It was formerly held that the wages of the crew depended on the earning of freight by the ship; as Lord Stowell expressed it, 'freight was the mother of wages.' This rule has been finally set aside by the Merchant Shipping Act, 1854. Even in case of shipwreck a seaman may recover his wages; but his claim will be barred if evidence can be given to show that he failed to exert himself to the utmost to save the ship and cargo. The old rule is adhered to in America; but it does not apply to the master, nor does it apply to seamen if freight has been lost by the fault of the master or owners. Freight may be made the subject of insurance. See CARRIER, INSURANCE.

**Freiligrath**, **FERDINAND**, a poet of Germany, was born at Detmold, in the principality of Lippe, 17th June 1810. The favourable reception accorded to his first collection of *Poems* in 1838 induced him to abandon commercial pursuits and devote himself to literature. From this time onwards he led a very unsettled life. In the poetry of this his earlier period it is the originality both of subject and of treatment, the oriental glow of the diction, the energy of the descriptions, and the finish of form that have secured the poet fame. But about the year 1844 a great change came over the spirit of his writing. Freiligrath was drawn into the political contest of the period as a bold champion and singer of democratic opinions. The publication of his radical *Glaubensbekenntniss* ('Confession of Faith'), in the same year, compelled him to take refuge in Belgium. In 1846 he repaired to London, and, although two years later he celebrated the revolutionary movement in the poems *Die Revolution* and *Februarklänge*, he was nevertheless included in the amnesty of March 19, and returned to Germany, settling at Düsseldorf, where he became the leader of the democratic party. Shortly after, he was impeached on account of his poem,

*Die Todten an die Lebenden* ('The Dead to the Living'), but after a celebrated trial acquitted, 3d October 1848. Nevertheless, a second prosecution in 1851 compelled him to flee once more, and he again took refuge in London. Nor did he return to Germany until 1863. His last years were spent at Stuttgart and Cannstatt, where he died 18th March 1876. In his later years Freiligrath returned in some respects to the style of his first work, a decided contrast to the somewhat strained and artificial poems of his political period, chief amongst which are *Ga Ira!* (1846) and *Neuere politische und sociale Gedichte* (1851). The latest poems were published as *Neue Gedichte* (1876). Freiligrath is also memorable as a translator from the English, particularly by his renderings of Longfellow, Shakespeare, &c. The popularity of his earliest book, *Gedichte*, is attested by its reaching a 43d edition in 1883. A complete edition of his works appeared at Stuttgart (6 vols. 1870; 5th ed. 1886). See his *Life*, by Schmidt-Weissenfels (1876), and Buchner (1881).

**Freischütz** ('free-shot'), the name given to a legendary hunter and marksman who gets a number of bullets (*Freikugeln*) from the devil, six of which always hit the mark, while the seventh is at the absolute disposal of the devil himself, who directs it at his pleasure. A northern variant makes the man a fowler who sells his soul to the devil for an unerring aim for seven years. Fortunately there is one condition—that the enemy should always be able to name the game being shot, and the fowler's wife, seeing in this a way of escape for her unhappy husband, strips, tarts, and feathers herself, and so outwits the devil to her husband's salvation. The story was first treated by Apcl in the first part of his *Gespensterbuch* (1810), and was adapted by F. Kind for the opera, *Der Freischütz* (*Fr. Roland des Bois*), which the genius of Weber has given to the world. See Grässe, *Die Quelle des Freischütz* (Dresden, 1875).

**Freising**, a town of Bavaria, on the Isar, 22 miles NNE. of Munich by rail, with 8850 inhabitants, and manufactures of threshing-machines and hand-mills, turf-cutting, and book-printing (since 1495). The chief buildings are the beautiful cathedral (1160) and the former episcopal palace (now a theological seminary). Close by is an old Benedictine abbey (725-1803), now a royal model-farm, with schools of brewing and horticulture. The bishopric of Freising dated as far back as 724 A.D., and its bishops were made princes of the empire in the 17th century, their authority embracing an area of 320 sq. m., with 27,000 inhabitants; the see was secularised in 1802.

**Freistadt** (Hung. *Galgóc*), a market-town of Hungary, 40 miles NE. of Presburg by rail, on the Waag, opposite the fortress and prison of Leopoldstadt. Pop. 6409.

**Fréjus**, a small town in the French department of Var, a mile inland from the Mediterranean Sea, and 22 miles SW. of Cannes by rail. It was originally a colony from Marseilles, and was afterwards colonised anew by Julius Cæsar, and called Forum Julii; here Agricola was born. It has traces of a lighthouse, walls, an amphitheatre (restored, 1868-69), and other Roman remains. The ancient harbour, in which Augustus stationed the fleet of 300 galleys which had been captured from Antony at Actium, has become silted up. Here, or rather at the new harbour of St Raphael, 1½ mile off, Napoleon landed on his return from Egypt in 1799, and embarked for Elba in 1814. Pop. 2712.

**Frelinghuysen**, FREDERICK, an American statesman, grandson of a Dutch pastor who emigrated to New Jersey in 1720, was born in 1753, graduated at Princeton, and was admitted to the

bar in 1774. He raised a corps of artillery, and took part in the battles of Trenton and Monmouth Court-house; and he was a member of the Continental Congress in 1778 and 1782-83, and a United States senator in 1793-96. In 1794 he was made a major-general of militia. He died in 1804.—His second son, THEODORE, was born in 1787, graduated at Princeton in 1804, and practised law in Newark, where he became state attorney-general. In the United States senate (1829-35) his speeches earned him the title of 'the Christian statesman.' He became chancellor of the university of New York in 1839, and in 1844 was nominated by the Whig party for the vice-presidency of the United States, on the same ticket with Henry Clay. In 1850 he was chosen president of Rutgers College, New Brunswick, where he died in 1861.—His nephew, FREDERICK THEODORE, born in 1817, graduated at Rutgers in 1836, and succeeded in 1839 to his uncle's practice. He was attorney-general of New Jersey in 1861-66, and in 1866-69 and 1871-77 he sat in the United States senate, where he carried a bill against polygamy, and had charge of Charles Sumner's civil-rights bill. He was secretary of state in Arthur's cabinet, 1881-83, and retired from office exhausted by his labours, to die at Newark, 20th May 1885.

**Fremantle**, the principal seaport of Western Australia, at the mouth of the Swan River, 12 miles SW. of Perth by rail. Its chief building is the town-hall, erected at a cost of £12,000. A series of extensive works have been undertaken for the improvement of the harbour, which is somewhat exposed, especially on the north side. The town was named after Captain Fremantle of H.M.S. *Challenger* (1829). Pop. about 5000.

**Fremont**, capital of Sandusky county, Ohio, at the head of navigation on the Sandusky River, 30 miles SE. of Toledo by rail, with manufactures of flour, iron, lime, and farming-machinery. Pop. (1880) 8446.

**Frémont**, JOHN CHARLES, an American explorer, was born at Savannah, Georgia, January 21, 1813, the son of a Frenchman and a Virginian lady. In 1835 he was appointed professor of mathematics in the navy, but soon turned his attention to civil-engineering, and was employed in surveys under the topographical corps, in which he received a commission in 1838. In 1842 he explored the South Pass of the Rocky Mountains, under government authority, and demonstrated the feasibility of an overland route between the two sides of the continent. The highest peak of the Wind River Mountains (13,570 feet above the sea), which he ascended in August, is now called Frémont's Peak. His report of the expedition attracted much attention. In 1843 he again crossed the South Pass, explored the Great Salt Lake, and advanced as far as Fort Vancouver, near the mouth of the Columbia River. On his return, in the following winter, he encountered great sufferings from cold and hunger, and was compelled to force a passage over the snow-covered mountains into California, which he accomplished in forty days, reaching the Sacramento in March, with his men almost reduced to skeletons. He returned to Kansas in July, and the remainder of the year was taken up in preparing his report. He was brevetted captain in January 1845, and in the spring of the same year set out on a third expedition to explore the watershed between the Mississippi and Pacific. During the war with Mexico he cleared the northern part of California of Mexican troops, but became involved in a dispute between two of his superior officers in regard to the right of command in California, which led to his trial by court-martial, when he was sentenced to be dismissed from the service. The president

remitted the penalty, but Frémont resigned his commission. In 1848 he started upon a fourth expedition, at his own expense, along the upper waters of the Rio Grande; but, the guide having lost his way among the snows of the great Sierra, the survivors—only two-thirds of the party—were compelled to return to Santa Fé, after unspeakable sufferings, in which they had been even driven to cannibalism to support life. In 1849, however, he succeeded in reaching California, where he settled, and in the following year took his seat as senator for the newly-admitted state. In 1850, also, he received a gold medal from the king of Prussia, and the 'founder's medal' of the Royal Geographical Society of London, while the Geographical Society of Berlin made him an honorary member. In 1853 he conducted a fifth expedition along the route of the fourth. In 1856 he was the Republican and anti-slavery candidate for the presidency, but was defeated by Buchanan; in 1864 he was again nominated by a section of the party, but withdrew in favour of Lincoln, 'to prevent the election of the Democratic candidate.' In 1861-62 he was employed in the regular army, with the commission of major-general, but he resigned rather than serve under General Pope. In 1873 the French government sentenced him by default to fine and imprisonment for fraud in connection with his scheme for a southern railway to the Pacific, although he appears free from any real responsibility for the misstatements on which the action was based. Frémont was governor of Arizona in 1878-82, and died 13th July 1890. He published, besides accounts of his explorations, *Memoirs of my Life* (1886). See also his wife's *Souvenirs of my Times* (1887).

**French Beans.** See BEAN.

**French Berries,** AVIGNON BERRIES, PERSIAN BERRIES, or YELLOW BERRIES (Fr. *Graines d'Avignon*), small berries, the fruit of certain species of Buckthorn (q.v.), but principally of the Yellow-berried Buckthorn (*Rhamnus infectorius*), which were formerly largely imported from the Levant and southern France as a yellow dye; being fugitive, however, this dyestuff has very much given place to that of mineral dyes.

**French Honeysuckle** (*Hedysarum coronarium*), a beautiful leguminous biennial, only seen in flower-gardens in northern Europe, but pretty extensively cultivated in Italy, the Balearic Isles, &c., as green fodder or for hay. The genus *Hedysarum* contains many species, extensively diffused over the warmer parts of the world. A few are found in cold regions, as *H. alpinum* of the Alps or *H. fruticosum* in Siberia. The bast of *H. lagopodioides* of the East Indies yields a textile fibre.

**French Polishing,** the name given to the usual method of polishing furniture. Simple varnishing with copal or mastic varnish, put on with a brush, produces a comparatively uneven surface, which soon wears off with friction. A French-polished surface, on the other hand, is beautifully smooth, glossy, and very durable if occasionally rubbed over with ordinary furniture paste. The process consists in rubbing the 'polish,' which chiefly consists of shell-lac dissolved in alcohol (methylated spirit), well into the pores of the wood. After it has been left for a night to harden, the surface is next rubbed over with sand-paper. These operations are repeated several times, but the wood finally receives two rubbings with the polish only. The pads or rubbers used are either of flannel or cotton-wool, covered with thin calico dipped in linseed-oil. An 'egg shell' finish is given to the surface either by rubbing over the ordinary French-polished surface with pumice and linseed-oil, or by applying the polishing solution in a thin state. Ebony, satinwood, and Spanish mahogany are

more easily polished than oak, American walnut, or rosewood. Neither vessels containing hot water nor bottles of perfumes made up with alcohol should be placed on polished wood.

The composition of French polish, sometimes called cabinetmakers' polish, varies very much. A good receipt is 1½ lb. shell-lac, 1 oz. mastic, 2 oz. gum benzoin, 1 gallon methylated spirit. Another is 10 parts shell-lac, 40 parts methylated spirit. For light-coloured woods the polish should be made of white shell-lac. See *Fabrication of Varnishes, Lacquers, &c.*, by Erwin Andres (trans. by Brant, Phila. and Lond. 1882).

**French River,** a stream of Ontario, empties Lake Nipissing into Lake Huron, entering Georgian Bay, after a rapid course of 60 miles.

**Frere, Sir HENRY BARTLE EDWARD**, English diplomatist and administrator, was born in Wales, 20th March 1815, and educated at Haileybury College for the Indian Civil Service, which he entered in 1833. After distinguishing himself as an administrator in Maltratta, he became British Resident at Sattara in 1847, and three years later chief-commissioner of Sind. There he began a series of useful works in the opening up of routes of communication, the cutting of canals, and the construction of a harbour at Karrachee. This work was interrupted by the Mutiny. When the troubles began Bartle Frere's first step was to occupy the fortress of Multan, in consequence of which he was able not only to keep his own province in subjection, but also to send help to his colleagues in the adjoining provinces. In 1862 he was appointed governor of Bombay, which post he held until his return to England in 1867. He was then knighted, and nominated a member of the Indian Council in London. Five years after his return home he was sent out to Zanzibar as a special commissioner to inquire into the slave-trade, and signed a treaty with the sultan abolishing the traffic in slaves with the interior of Africa. In 1877 he was appointed governor of the Cape and High Commissioner for the settlement of affairs in South Africa. It was intended that he should carry out the confederation of the South African colonies, but his purpose was frustrated by the action of the Boers and by the wars against the Kaffirs (1877-78) and the Zulus (1878-79). Respecting the justifiableness of this last war, and Sir Bartle Frere's treatment of the Zulu king, Cetewayo, there existed considerable difference of opinion amongst English statesmen and others conversant with the questions at issue. Recalled by the government in 1880, Sir Bartle devoted himself during the next four years to the duties entailed upon him by his position as president of various learned societies (amongst others the Royal Asiatic and the Royal Geographical), and to the promotion of missionary work. He published several works on Indian and African subjects. He died at Wimbledon, 29th May 1884. On 5th June 1888 the Prince of Wales unveiled a monument to him on the Thames Embankment.

**Frere, JOHN HOOKHAM**, the translator of Aristophanes, was born of a good Suffolk family, in London, 21st May 1769, and was educated at Eton and Caius College, Cambridge. He next entered the foreign office under Lord Grenville, and in 1796 he was returned for the Cornish pocket-borough of Looc. Along with his old schoolfellow Canning he gave steady support to Pitt's government, and contributed to the *Anti-Jacobin*. His chief piece was *The Loves of the Triangles*, a parody on Darwin's *Loves of the Plants*, but he had a share with Canning in *The Needy Knife-grinder*. Under-secretary for Foreign Affairs (1799), he was appointed envoy to Lisbon (1800), and then twice minister to Spain (1802 and 1808), where his position was one of

extreme difficulty. He was recalled after the retreat to Comma, and, renouncing public life, retired in 1821 to Malta, although he was offered the embassy to St Petersburg and twice the honour of a peerage. Here he devoted himself to the study of Greek, Hebrew, and Maltese, was famous for his hospitality, and died 7th January 1841. Frère's clever mock-heroic poem entitled *Prospectus and Specimen of an intended National Work by William and Robert Whistlcraft, of Stowmarket, in Suffolk, Harness and Collar Makers, &c.* (1817), suggested its *ottava rima* to Byron for his *Beppo*; but his fame rests securest on his admirable translations of the *Acharnians*, the *Knights*, the *Birds*, and the *Frogs* of Aristophanes. These are themselves works of genius, and remain without a rival in English, yet were privately printed, and only made public by Sir G. Cornewall Lewis in the *Classical Museum* for 1847. Frère's works, with a memoir, were published in 1871 by his nephews, W. E. and Sir Bartle Frère.

**Frère, PIERRE ÉDOUARD**, figure-painter, was born in Paris, 10th January 1819. He studied under Delaroche, but speedily turned his attention to the rendering of humble life, and especially to the portrayal of cottage children. His works are usually small in size, painted with extreme care and accuracy, and characterised by the greatest sweetness and purity of feeling. He first exhibited in the Salon of 1843, and his works have frequently been on view in London. His 'Student,' 'Luncheon,' 'Sempstress,' 'Prayer,' and 'The Cleaner Boy,' when they were exhibited in the French Gallery in 1857 and 1858, won the most enthusiastic praise from Mr Ruskin, who pronounced that their painter united 'the depth of Wordsworth, the grace of Reynolds, and the holiness of Angelico.' In 1855 he became a Knight of the Legion of Honour. He died at Ecouen, 23d May 1886.

**Fréron, ÉLIE CATHERINE**, French writer, born in 1718 at Quimper, was a professor in the Collège Louis le Grand, and died 10th March 1776 at Paris. He wrote in defence of church and king against the Encyclopédistes, especially Voltaire, who, stung by these attacks, retaliated by ridiculing his adversary in the drama *L'Ecossois* (1760).

**Fresco.** Fresco-painting is the art of painting with colours, consisting chiefly of natural earths, upon walls covered with damp, freshly laid plaster. The art of painting upon plaster surfaces is of great antiquity. The sides of the Etruscan tombs were coated with lime and decorated in this manner; the same method was employed in Egypt and in many of the mural paintings of Pompeii; and the process was continued by the early Italian painters, and is that known as *secco* or *fresco secco*. It is described as follows in a treatise upon painting by the monk known as Theophilus, a work certainly written before the close of the 12th century: 'When figures or other objects are drawn on a dry wall, the surface should be first sprinkled with water till it is quite moist. While the wall is in this state, the colours are to be applied, all the tints being mixed with lime, and drying as the wall dries, in order that they may adhere.' The method is still in general use in Italy and in Munich, for the production of both exterior and interior decoration. In modern practice lime and fine sand are used for the final coating of plaster, which is allowed to dry thoroughly, and then smoothed by the application of pumice-stone. On the evening before the painter is to begin his work the surface is thoroughly damped with water in which a little lime has been dissolved, and the process is again repeated next morning. The colours are the same as those used in true fresco-painting, which we next describe; but *fresco secco* possesses this advan-

tage over true fresco, that the artist can leave his work at any point, and, having simply redampened the wall, again resume it. The *secco* process is excellently adapted for rough decorative work, and is as durable as true fresco; but it is less suited for delicate and refined artistic productions.

True fresco, the *buon fresco* of the Italians, did not come into use till about the close of the 14th century; and the subjects from Genesis by Pietro d'Orvieto, in the Campo Santo, Pisa, to which the date of 1390 has been assigned, are regarded as the earliest extant works in the method. In true fresco the plaster is laid fresh and damp every morning on the wall. Upon this surface the artist places his full-sized outline cartoon, and transfers its forms, by pouncing or by tracing with the blunted point of a style, to the moist plaster. He then proceeds to fill in the outlines of his design with the brush, guided by a small coloured study which he has previously prepared. At the close of his day's work the portions of the plaster ground which he has not covered are carefully scraped away, and before the painting is resumed a fresh surface is laid. Care is taken that the lines of junction in the plaster shall occur in the shadows, or coincide with the contours of the figures, so that they may not unduly attract attention; and the frequent occurrence of such joinings in a mural painting is one of the most obvious tests of its having been executed in true fresco. As he can use only such colours as resist the decomposing action of lime, the palette of the fresco-painter is far more restricted in range than that of the painter in oils. His white is simply a finely-prepared lime; his yellows, the ochres; his reds, the ochres burned, with cinabrese and sinopia, both earths; his green, terra vert; his black, lampblack and charcoal; his blue, ultramarine and cobalt: and in the application of these he is obliged to make allowance for their becoming paler in tone as the ground of plaster dries. He must also work lightly, so as not to injure his surface, and avoid retouching as far as possible, as only a certain proportion of moist colour can be properly incorporated by the plaster, and if this proportion is exceeded the pigments remain unfixed upon the surface. When properly applied the colours enter into complete combination with the lime of the plaster. Thus, a painting in fresco can be washed without injury; and with ordinary care, in a southern climate and upon a properly built wall, the process is a very permanent one.

In the fine arts generally, the material conditions of the process employed have the most powerful effect upon the temper of the artist; and in the imitative arts they go far to determine the particular qualities of visible things which the artist shall be inevitably led to emphasise. This is especially the case in regard to the process which we are considering. The rapidity of handling necessary in fresco-painting upon a damp surface of fresh plaster, and the practical impossibility of correction except by the summary method of cutting away the faulty portion and relaying it with a new plaster ground, necessitated the clearest apprehension on the part of the painter of what he meant to perform, and was as stringent a discipline as could well be imagined in certainty and decision of handling. Again, the process rendered impossible any trivial *finesse* of mere imitative dexterity. Reproduction of the niceties of texture, for instance, a legitimate enough aim for the oil-painter of cabinet-sized subjects, and one which his process enabled him to attain, was beyond the scope of the fresco-painter's method; who was accordingly led to concentrate his attention upon other things—upon nobility of design, dignity of grouping, expressiveness of gesture and countenance—in fact, upon the very qualities proper to that class of monumental

mural work for which fresco was employed in Italy. Further, his process led him to seek for colour rather than for chiar-oscuro; and the restriction of his palette to a comparatively few pigments, and these mainly natural earths, tended towards that simplicity and pure harmony of colouring proper to paintings covering large surfaces and employed as an architectural adjunct—a result facilitated by the softening influence of the lime with which the colours combined, and by the fine, dead, lustreless surface of the plaster ground.

Fresco-painting was accordingly the chosen method by which the greatest Italian masters expressed, upon the walls of cathedral and council-room, their deepest conceptions of religion and polity. Giotto employed it in the Arena Chapel of Padua and the church of St Francis at Assisi; Orcagna in the church of S. Maria Novella, Fra Angelico in the Convent of St Mark, Masaccio in the Brancacci Chapel of the Carmine, Gozzoli in the Riccardi Chapel, at Florence; Perugino in the Sala del Cambio of his native city; Lnini in the churches of Milan, Lugano, and Saronno; Pinturicchio in the cathedral library of Siena; Correggio in the cathedral of Parma; Raphael in the Vatican: and when Michael Angelo was directed by Pope Paul III. to paint his 'Last Judgment' in the Sistine Chapel in oils, instead of in fresco as at first agreed on, he protested that oil-painting was an art for women and indolent persons, that fresco was the art for men and painters, and was allowed to have his way. The celebrated 'Last Supper' of Leonardo at Milan is a mural painting in oils, not fresco; and the method used, combined with the fact that the production of the work extended over a period of years, and that the faulty masonry of the wall afforded insufficient protection against damp, accounts for the ruined state in which the subject now exists.

While, however, the qualities which we have indicated above are those peculiar to fresco-painting executed on newly-laid plaster, and are characteristic of works substantially carried out in this method, it is seldom that we find the process employed in its absolute purity, entirely unaccompanied by other modes of execution. From the earliest times the Italian painters have been unable to resist the temptation of adding more of detail and enrichment than the rapidity of true fresco rendered possible. In a greater or less degree they all retouched their frescoes with distemper colour, in which pigments were mixed with a vehicle of albumen and yoke of egg, with fig-tree juice, and with gum tragacanth, and applied at leisure, after the plaster had become dry—a practice which tended to lessen the permanence of the work. In the treatise on painting by Cennini (1437) it is stated that distemper was always used in the completion of frescoes; and these retouchings are styled *a secco* by Vasari, a phrase to be distinguished from the *fresco secco* already described. The works of Masaccio may be taken as examples of paintings executed in what is practically true fresco with little retouching; while Pinturicchio's subjects in the cathedral library at Siena show the largest introduction of distemper, further heightened by gilding.

In modern times the processes of fresco were introduced into Germany by Cornelius, Overbeck, Veit, and F. W. Schadow, who had learned the art at Rome, and had there decorated the Casa Bartoldi, the palace of the consul-general of Prussia; and much work of the kind was executed in the north by these painters, J. Schnorr, and Kaulbach.

In England an effort was made to found a national school of mural art by the appointment of a Royal Commission for the decoration of the new Houses of Parliament at Westminster. A

report was prepared embodying much valuable information regarding the various processes of fresco; cartoon competitions were held for the purpose of selecting painters capable of historic art; and Dyce, Armitage (who had aided Delacroix in his great mural painting in oils on the *Hémicycle* in the Palais des Beaux-arts, Paris), Watts, Cope, and other prominent painters received commissions for frescoes; but the scheme was never carried out in its entirety. The great monumental works by Machise in the Houses of Parliament, 'The Interview of Wellington and Blicher after Waterloo' and 'The Death of Nelson,' were carried out in stereochromic or 'water-glass' painting, invented by Dr J. R. Enchis (see GLASS, SOLUBLE), in which a painting executed in *fresco secco* was protected by the application of a solution of silica and potass. But, though many interesting experiments have been made, no school of fresco-painters has yet been formed in England. England's moist climate, and especially the vitiated atmosphere of London, seems almost inevitably fatal to the permanency of works executed in fresco; and while subjects painted by G. F. Watts many years ago, on the walls of a villa near Florence, are still uninjured, his frescoes, produced by exactly the same process, at Westminster and in Lincoln's Inn bear marked signs of deterioration. See CARTOON, DISTEMPER, PAINTING, MURAL DECORATION.

**Fresh-water Herring.** See COREGONUS.

**Fresnel,** AUGUSTIN JEAN, French physicist, born at Broglie, Eure, 10th May 1788. He chose the profession of engineer, finally becoming head of the department of public works (*ponts et chaussées*) at Paris. He died at Ville d'Avray, near Paris, 14th July 1827. In 1825 he was elected a Fellow of the Royal Society of London. His claim to notice rests upon his optical investigations, which contributed materially to the establishment of the undulatory theory of light. His discoveries are connected chiefly with the properties of polarised light, and with the theories of the interference and diffraction of light. He invented the compound lighthouse lenses which bear his name. The French government published his collected works (3 vols. 1860-70).

**Fresnillo,** a mining town of the Mexican state Zacatecas, lies 7200 feet above sea-level, at the foot of the argentiferous Cerro de Proaño, and has amalgamation works, &c. Pop. 15,000.

**Fret,** a figure in Heraldry, resembling two narrow bendlets dexter and sinister interlaced with a mascle. When six, eight, or more pieces

Fret.

Fretty.

are represented crossing and interlacing like lattice-work, the shield is said to be fretty.

**Freund,** WILHELM, German philologist, born of Jewish parents, 27th January 1806, at Kempen in Posen. Having studied at Berlin and Breslau (1824-28), he taught at Breslau, Hirschberg (1848-51), and Gleiwitz (1855-70), and finally settled down at Breslau to a life of literary activity. His principal work is a *Wörterbuch der lateinischen Sprache* (4 vols. Leip. 1834-45), on which the best-known English-Latin dictionaries (Andrews, Lewis and Short, &c.) are based. Besides this he has written a number of school-books, especially on the Greek and Roman classics, and some on

philology, as *Wie studiert man Philologie?* (5th ed. Leip. 1885), and *Grundzüge der philologischen Wissenschaften* (3d ed. 1885 et seq.).

**Freycinet**, CHARLES LOUIS DE SAULCES DE, French statesman, born at Foix in 1828, was an engineer of note when the Franco-Prussian war broke out. In October 1870 Gambetta appointed him his subordinate in the war department; his conduct as such he has himself described in *La Guerre en Province pendant la siège de Paris* (1871). Elected to the senate in 1876, he became minister of Public Works in 1877, and premier in 1879, with the portfolio of foreign affairs. He resigned in 1880, but formed a ministry again in 1882 and 1886; and in 1889 he became minister of War under M. Tirard. He has published several works on engineering, sanitation, &c., and in 1878 was elected a member of the Academy of Sciences.

**Freyja**, in Scandinavian Mythology, the goddess of love, who dispenses all joys, delights, and pleasures. She was wont to drive out in a chariot drawn by two cats. She claimed one-half of those slain in battle. She wept golden tears for her husband, who had travelled into distant countries. This goddess was particularly worshipped in Sweden. Freyja gave her name as the general designation for all women of rank and wealth in medieval times (*frouwa* = *frau*). See FRIGGA.

**Freyr**, in northern Mythology, the son of Njord, of the dynasty of the Vanagods, was adopted with his father among the Æsir. He presided over rain and sunshine, and bestowed good harvests, peace, and wealth. His wife was Gerda, daughter of the giant Gymer, and Freyr's wooing forms one of the most beautiful episodes in northern mythology. He was held in especial veneration by the Swedes, his principal temple being at Upsala. His festival was celebrated at Christmas (Yule-tide).

**Freytag**, GEORG WILHELM FRIEDRICH, Orientalist, was born at Lüneburg in 1788, and from Göttingen proceeded to Paris, where he became a pupil of Silvestre de Sacy. Under him he continued the study of Arabic, Persian, and Turkish, until he was called to the chair of Oriental Languages at Bonn in 1819. He died there, 16th November 1861. His reputation rests on his *Lexicon Arabico-Latinum* (4 vols. 1830-37), and his works on Arabic literature and history, as editions of Lokman's *Fables* (1823), Hamasa's *Odes* (1828-52), and Ibn Arabshah's *Fakihet al-Kholefa* (1832-52), *Carmina Arabicum* (1830), *Chrestomathia Arabica* (1834), *Arabum Proverbia* (1838-43), and *Selecta ex Historia Halebi* (1819).

**Freytag**, GUSTAV, German novelist and playwright, was born 13th July 1816, at Kreuzburg, in Silesia, studied at Breslau and Berlin, and from 1839 till 1847 was a *privat-docent* of German language and literature in the former university. Afterwards he lived successively at Dresden, at Leipzig and in the neighbourhood of Gotha, and (since 1879) at Wiesbaden. A deputy to the North German Diet, he served in the French campaign (1870), and in 1854 was created a *hofrath*, in 1886 a *geheimrath*, of Coburg-Gotha. His comedies and other plays—*Die Valentine* (1846), *Die Journalisten* (1853), &c.—proved brilliant successes both on and off the stage; but his greatest achievement in literature is undoubtedly *Soll und Haben* (1855; 30th ed. 1885), a realistic novel of German commercial life, which was translated into English under the title of *Debit and Credit* (1858). It was followed, but not surpassed or even equalled, by *Die Verlorne Handschrift* (1864; Eng., *The Lost Manuscript*, 1865), and the series (1872-81) called *Die Ahnen* (*Our Ancestors*), which includes *Ingo und Ingeran*, *Das Nest der Zaunkönige*, *Die Brüder vom Deutschen Hause*, *Markus König*, *Die Geschwister*,

and *Aus einer kleinen Stadt*. All these, with his poems, his sketches of German life, past and present, and an autobiography, are comprised in the collected edition of his works, published at Leipzig since 1886. See Alberti, *Gustav Freytag* (1885).

**Friar**, a name common to the members of certain religious orders in the Roman Catholic Church, and generally employed in contradistinction to the name Monk and Regular Clerk. The name friar, although from its etymology (*frere*, 'brother') it belongs to the members of all religious brotherhoods, yet has come to be reserved almost exclusively for the brethren of the Mendicant orders; who at their institution stood to the old established orders as poor to rich, rude to cultivated, popular to aristocratic, the ascetic and self-denying to the comparatively leisured and comfortable. It is applied chiefly to the four great orders, Dominicans, Franciscans, Augustinians, Carmelites, and later to the Trinitarians and Servites, and to the various branches of these orders. The Franciscans were properly denominated 'Friars Minor' (*Frutres Minores*). The Dominicans received, in contrast, the title 'Friars Major,' which, however, was perhaps rather a sobriquet than a serious name. From the colour or other peculiarity of their habit, the Franciscans were popularly called Grey Friars; the Black Friars were Dominicans; the White Friars were the Carmelites; Austin Friars were the Augustinians; and the Crutched or Croneled Friars was the name given to the Trinitarians, from the cross which was embroidered upon their habit (*Cruciati*, 'crossed'). In the Mendicant orders the friars in priest's orders are styled 'father,' the other members simply 'brother.' See the articles on the several Mendicant orders, also MONACHISM; and Jessopp, *The Coming of the Friars* (1888).

**Friars' Balsam**. See BENZOIN.

**Fribourg**. See FREIBURG.

**Friction** (Lat., 'rubbing'; Fr. *frottement*). In the science of Mechanism as well as in practical engineering one of the two main hindrances to motion and work is the tangential reaction between the pieces of a machine when one slides or rolls upon another. Since no surface is absolutely smooth, any two bodies in contact produce a mutual resistance to relative motion at all the points where they touch, and some measurement of this obstructing force is of the first importance in certain practical problems. A recent theory is that frictional resistance is due to the development of electricity over the area of contact.

Statically, friction is a force acting in the tangent plane of two bodies, when one slides or rolls upon another, and always in a direction opposite to that in which the moving body tends. The laws of the action of this resistance were investigated in 1781 by Coulomb at Rochefort, and more fully illustrated in 1830-34 by Morin at Metz, but the conclusions reached by George Rennie's experiments are of still greater importance in practical mechanism.

The general results established as to friction are—(1) It does not depend upon the extent of the surface in contact, but upon the pressure exerted between the touching bodies; (2) it does not depend upon the rate of relative motion of the surfaces, except in certain extreme cases; (3) *statical friction*—i.e. for the state bordering on motion—is increased if the surfaces have for a certain time remained in contact; (4) the energy which seems lost, owing to friction, develops heat or electricity; (5) the lighter the normal pressure between two pieces of a machine, the finer and more fluid should be the unguents applied to reduce the friction; (6) in rolling friction, and especially carriage traction, the resistance is inversely as the radius of the wheel or roller.

A main object of all the experiments was to obtain that measure of the force of friction which is called its coefficient. If M (fig. 1) represents a block of oak resting on an elm plank, AB, then when the plank is raised till M is just on the point of sliding down

Fig. 1.

the inclined plane the fraction  $\frac{19}{60}$  is called the 'coefficient of friction for oak on elm,' 60 being the length of the base, and 19 the perpendicular or vertical at its extremity. Thus, the angle A is called the angle of friction, and  $\tan A (= \frac{19}{60})$  is another name for the coefficient of friction. That fraction is easily shown to be the ratio of the resistance to the normal pressure between the surfaces in contact.

Statical friction or adhesion must manifestly vary according to the quality of the surfaces in contact. In some woods, when smoothed by rubbing, the coefficient of friction is reduced from  $\frac{1}{3}$  to  $\frac{1}{4}$ ; and when the surfaces are smeared with oil, grease, or other lubricant the adhesion is not only greatly diminished, but is affected so long as any trace of unctuous matter remains. If wood rests motionless on wood for 100 seconds, the adhesion is greater than after resting only 20 seconds; but after about two minutes the coefficient is not increased by continuing the contact.

When once the adhesion is overcome, the friction is sensibly diminished during motion, as is shown by the following coefficients selected from Morin's tables :

| Surfaces in Contact.     | Adhesion. | Friction during motion |
|--------------------------|-----------|------------------------|
| Wood on wood, dry.....   | ·50       | ·30                    |
| " " soaped.....          | ·36       | ·14                    |
| " " greased.....         | ·19       | ·07                    |
| Wood on metal, dry.....  | ·60       | ·42                    |
| " " greased.....         | ·63       | ·45                    |
| Metal on metal, dry..... | ·18       | ·13                    |
| " " oiled.....           | ·12       | ·07                    |

The coefficient of friction was determined by George Rennie for all ordinary bodies with various details. The following are some of his results for kinetic friction :

|                            |      |                               |      |
|----------------------------|------|-------------------------------|------|
| Steel on ice.....          | ·014 | Soft steel on soft steel..... | ·148 |
| Ice on ice.....            | ·028 | Leather on iron.....          | ·25  |
| Hardwood on hardwood.....  | ·13  | Granite on granite.....       | ·30  |
| Brass on wrought-iron..... | ·133 | Sandstone on sandstone.....   | ·36  |
| Yellow deal on deal.....   | ·35  | Woollen cloth on cloth.....   | ·43  |

The following table gives not only the coefficient

of certain selected substances, but also their angle of friction as already defined :

| Surfaces in Contact.             | Friction. | Angle.  |
|----------------------------------|-----------|---------|
| Wrought-iron on brass.....       | ·17       | 0° 39'  |
| Steel on cast-iron.....          | ·20       | 11° 19' |
| Marble (polished) on marble..... | ·10       | 0° 6'   |
| Birch on birch.....              | ·64       | 32° 38' |
| Wrought-iron on oak.....         | ·62       | 81° 47' |
| elm.                             | ·25       | 14° 3'  |

It should be noted that, though technically prejudicial to the work of machines, friction plays an important and useful part in practical mechanics as well as ordinary life. It is necessary, e.g., not only to enable a man to walk, but for the action of the driving-wheel of every locomotive; and is essential to the utility of all nails, screws, and wedges, as well as railway-brakes, &c. In the important case of a strap round a drum, friction is utilised to convey motion most simply and usefully. Besides lubricants rollers or wheels are often used in mechanism to diminish friction, by changing a sliding or rubbing motion to a rolling one. A roller is theoretically better than a wheel, because in the latter case the stress is thrown on a slender axle. Fig. 2 gives an instance of the former contrivance, showing a cross section of a gudgeon, G, turning midway between six rollers, R, of the same size enclosed in a fixed circular box with closed end.

Fig. 2.

With reference to the reduction of friction by lubricants, it is found that if suitably chosen and applied they tend to equalise the coefficient or measure of obstruction. Thus, hog's lard and olive-oil interposed in a continuous stratum between the surfaces of wood on wood, wood on metal, metal on wood, or metal on metal (when in motion), have nearly all the same coefficient of friction—the value being in all cases included between ·07 and ·08. Tallow gives the same coefficient as the other unguents, except in the case of metal on metal, when the coefficient rises to ·10. Blacklead is frequently used to reduce the friction between wood and wood.

With regard to fluid friction, we need only note that it depends on the viscosity of the liquid, and in certain cases is reduced by increase of temperature. Thus, a solid body in ice-cold water finds greater resistance to motion than in warm water. Some recent physicists have shown that the fluid friction due to our ocean Tides (q.v.) is gradually retarding the earth's rotation, and bringing the moon nearer. See Thurston's *Friction and Lost Work in Machinery* (New York, 1886).
